About this Document

The **ESP32-S3 Technical Reference Manual** is targeted at developers working on low level software projects that use ESP32-S3 SoC. It provides information for the ESP32-S3 hardware modules listed below. The modules detailed in this document provide an overview, list of features, hardware architecture details, any necessary programming guidelines, as well as a register listing.

Release Status at a Glance

Note that this manual is still work in progress. See our release progress below:

No.	ESP32-S3 Chapters	Progress
1	I2C Controller (I2C)	Published
2	Reset and Clock	Published
3	I2S Controller (I2S)	26%
4	Camera-LCD Controller (CAM-LCD)	Published
5	Remote Control Peripheral (RMT)	Published
6	Random Number Generator (RNG)	Published
7	eFuse Controller (eFuse)	Published
8	Processor Instruction Extensions (PIE)	42%
9	System and Memory	Published
10	Permission Control (PMS)	Published
11	USB On-The-Go (USB)	Published
12	UART Controller (UART)	Published
13	Digital Signature (DS)	Published
14	Timer Group (TIMG)	Published
15	Watchdog Timers (WDT)	Published
16	GDMA Controller (GDMA)	Published
17	Motor Control PWM (MCPWM)	Published
18	SD/MMC Host Controller (SDHOST)	Published
19	LED PWM Controller (LEDC)	Published
20	Pulse Count Controller (PCNT)	Published
21	IO MUX and GPIO Matrix (GPIO, IO_MUX)	Published
22	Interrupt Matrix (INTERRUPT)	Published
23	System Registers (SYSREG)	Published
24	SPI Controller (SPI)	26%
25	On-Chip Sensors and Analog Signal Processing	58%
26	ULP Coprocessor (ULP-FSM, ULP-RISC-V)	Published
27	SHA Accelerator (SHA)	Published
28	Low-Power Management (RTC_CNTL)	47%
29	HMAC Accelerator (HMAC)	Published
30	AES Accelerator (AES)	Published
31	RSA Accelerator (RSA)	Published
32	Two-wire Automotive Interface (TWAI)	Published
33	External Memory Encryption and Decryption (XTS_AES)	Published
34	System Timer (SYSTIMER)	Published
35	Chip Boot Control (BOOTCTRL)	Published
36	Clock Glitch Detection	Published
37	XTAL32K Watchdog Timer (XTWDT)	Published
38	World Controller (WCL)	Published
39	USB Serial/JTAG Controller (USB_SERIAL_JTAG)	Published

Note:

Contents

1	ULP Coprocessor (ULP-FSM, ULP-RISC-V)	29
1.1	Overview	29
1.2	Features	29
1.3	Programming Workflow	30
1.4	ULP Coprocessor Sleep and Wakeup Workflow	31
1.5	ULP-FSM	33
1.5.1	Features	33
1.5.2	Instruction Set	33
1.5.2.1	ALU - Perform Arithmetic and Logic Operations	34
1.5.2.2	ST – Store Data in Memory	36
1.5.2.3	LD – Load Data from Memory	39
1.5.2.4	JUMP – Jump to an Absolute Address	40
1.5.2.5	JUMPR – Jump to a Relative Address (Conditional upon R0)	40
1.5.2.6	JUMPS – Jump to a Relative Address (Conditional upon Stage Count Register)	41
1.5.2.7	HALT – End the Program	42
1.5.2.8	WAKE – Wake up the Chip	42
1.5.2.9	WAIT – Wait for a Number of Cycles	42
1.5.2.10	TSENS – Take Measurement with Temperature Sensor	43
1.5.2.11	ADC – Take Measurement with ADC	43
1.5.2.12	REG_RD – Read from Peripheral Register	44
1.5.2.13	REG_WR – Write to Peripheral Register	44
1.6	ULP-RISC-V	45
1.6.1	Features	45
1.6.2	Multiplier and Divider	45
1.6.3	ULP-RISC-V Interrupts	46
1.6.3.1	Introduction	46
1.6.3.2	Interrupt Controller	46
1.6.3.3	Interrupt Instructions	47
1.6.3.4	RTC Peripheral Interrupts	48
1.7	RTC I2C Controller	49
1.7.1	Connecting RTC I2C Signals	49
1.7.2	Configuring RTC I2C	50
1.7.3	Using RTC I2C	50
1.7.3.1	Instruction Format	50
1.7.3.2	I2C_RD - I2C Read Workflow	51
1.7.3.3	I2C_WR - I2C Write Workflow	51
1.7.3.4	Detecting Error Conditions	52
1.7.4	RTC I2C Interrupts	52
1.8	Address Mapping	53
1.9	Register Summary	53
1.9.1	ULP (ALWAYS_ON) Register Summary	53
1.9.2	ULP (RTC_PERI) Register Summary	54

1.9.3	RTC I2C (RTC_PERI) Register Summary	54
1.9.4	RTC I2C (I2C) Register Summary	54
1.10	Registers	55
1.10.1	ULP (ALWAYS_ON) Registers	55
1.10.2	ULP (RTC_PERI) Registers	58
1.10.3	RTC I2C (RTC_PERI) Registers	62
1.10.4	RTC I2C (I2C) Registers	64
2	GDMA Controller (GDMA)	78
2.1	Overview	78
2.2	Features	78
2.3	Architecture	79
2.4	Functional Description	80
2.4.1	Linked List	80
2.4.2	Peripheral-to-Memory and Memory-to-Peripheral Data Transfer	81
2.4.3	Memory-to-Memory Data Transfer	81
2.4.4	Channel Buffer	82
2.4.5	Enabling GDMA	82
2.4.6	Linked List Reading Process	83
2.4.7	EOF	83
2.4.8	Accessing Internal RAM	84
2.4.9	Accessing External RAM	84
2.4.10	External RAM Access Permissions	85
2.4.11	Seamless Access to Internal and External RAM	86
2.4.12	Arbitration	86
2.4.13	Bandwidth	86
2.4.13.1	Bandwidth to Access Internal RAM	86
2.5	GDMA Interrupts	87
2.6	Programming Procedures	87
2.6.1	Programming Procedures for GDMA's Transmit Channel	87
2.6.2	Programming Procedures for GDMA's Receive Channel	88
2.6.3	Programming Procedures for Memory-to-Memory Transfer	88
2.7	Register Summary	89
2.8	Registers	95
3	System and Memory	118
3.1	Overview	118
3.2	Features	118
3.3	Functional Description	119
3.3.1	Address Mapping	119
3.3.2	Internal Memory	120
3.3.3	External Memory	123
3.3.3.1	External Memory Address Mapping	123
3.3.3.2	Cache	123
3.3.3.3	Cache Operations	124
3.3.4	GDMA Address Space	125

3.3.5	Modules/Peripherals	126
3.3.5.1	Module/Peripheral Address Mapping	126
4	eFuse Controller	129
4.1	Overview	129
4.2	Features	129
4.3	Functional Description	129
4.3.1	Structure	129
4.3.1.1	EFUSE_WR_DIS	136
4.3.1.2	EFUSE_RD_DIS	136
4.3.1.3	Data Storage	136
4.3.2	Programming of Parameters	137
4.3.3	User Read of Parameters	139
4.3.4	eFuse VDDQ Timing	141
4.3.5	The Use of Parameters by Hardware Modules	141
4.3.6	Interrupts	141
4.4	Register Summary	142
4.5	Registers	146
5	IO MUX and GPIO Matrix (GPIO, IO MUX)	189
5.1	Overview	189
5.2	Features	189
5.3	Architectural Overview	189
5.4	Peripheral Input via GPIO Matrix	191
5.4.1	Overview	191
5.4.2	Signal Synchronization	191
5.4.3	Functional Description	192
5.4.4	Simple GPIO Input	193
5.5	Peripheral Output via GPIO Matrix	193
5.5.1	Overview	193
5.5.2	Functional Description	194
5.5.3	Simple GPIO Output	195
5.5.4	Sigma Delta Modulated Output	195
5.5.4.1	Functional Description	195
5.5.4.2	SDM Configuration	196
5.6	Direct Input and Output via IO MUX	196
5.6.1	Overview	196
5.6.2	Functional Description	196
5.7	RTC IO MUX for Low Power and Analog Input/Output	196
5.7.1	Overview	196
5.7.2	Low Power Capabilities	197
5.7.3	Analog Functions	197
5.8	Pin Functions in Light-sleep	197
5.9	Pin Hold Feature	198
5.10	Power Supply and Management of GPIO Pins	198
5.10.1	Power Supply of GPIO Pins	198

5.10.2	Power Supply Management	198
5.11	Peripheral Signals via GPIO Matrix	198
5.12	IO MUX Function List	210
5.13	RTC IO MUX Pin List	211
5.14	Register Summary	213
5.14.1	GPIO Matrix Register Summary	213
5.14.2	IO MUX Register Summary	214
5.14.3	SDM Output Register Summary	216
5.14.4	RTC IO MUX Register Summary	216
5.15	Registers	217
5.15.1	GPIO Matrix Registers	218
5.15.2	IO MUX Registers	229
5.15.3	SDM Output Registers	231
5.15.4	RTC IO MUX Registers	233
6	Reset and Clock	242
6.1	Reset	242
6.1.1	Overview	242
6.1.2	Architectural Overview	242
6.1.3	Features	242
6.1.4	Functional Description	243
6.2	Clock	244
6.2.1	Overview	244
6.2.2	Architectural Overview	244
6.2.3	Features	244
6.2.4	Functional Description	245
6.2.4.1	CPU Clock	245
6.2.4.2	Peripheral Clocks	246
6.2.4.3	Wi-Fi and Bluetooth LE Clock	248
6.2.4.4	RTC Clock	248
7	Chip Boot Control	249
7.1	Overview	249
7.2	Boot Mode Control	250
7.3	ROM Code Printing Control	250
7.4	VDD_SPI Voltage Control	251
7.5	JTAG Signal Source Control	251
8	Interrupt Matrix (INTERRUPT)	253
8.1	Overview	253
8.2	Features	253
8.3	Functional Description	254
8.3.1	Peripheral Interrupt Sources	254
8.3.2	CPU Interrupts	258
8.3.3	Allocate Peripheral Interrupt Source to CPU _x Interrupt	259
8.3.3.1	Allocate one peripheral interrupt source (Source _Y) to CPU _x	259

8.3.3.2	Allocate multiple peripheral interrupt sources (Source_Yn) to CPUx	260
8.3.3.3	Disable CPUx peripheral interrupt source (Source_Y)	260
8.3.4	Disable CPUx NMI Interrupt	260
8.3.5	Query Current Interrupt Status of Peripheral Interrupt Source	260
8.4	Register Summary	260
8.4.1	CPU0 Interrupt Register Summary	261
8.4.2	CPU1 Interrupt Register Summary	264
8.5	Registers	269
8.5.1	CPU0 Interrupt Registers	269
8.5.2	CPU1 Interrupt Registers	273
9	System Timer (SYSTIMER)	279
9.1	Overview	279
9.2	Features	279
9.3	Clock Source Selection	280
9.4	Functional Description	280
9.4.1	Counter	280
9.4.2	Comparator and Alarm	281
9.4.3	Synchronization Operation	282
9.4.4	Interrupt	283
9.5	Programming Procedure	283
9.5.1	Read Current Count Value	283
9.5.2	Configure One-Time Alarm in Target Mode	283
9.5.3	Configure Periodic Alarms in Period Mode	283
9.5.4	Update After Deep-sleep and Light-sleep	284
9.6	Register Summary	284
9.7	Registers	286
10	Timer Group (TIMG)	299
10.1	Overview	299
10.2	Functional Description	300
10.2.1	16-bit Prescaler and Clock Selection	300
10.2.2	54-bit Time-base Counter	300
10.2.3	Alarm Generation	300
10.2.4	Timer Reload	301
10.2.5	SLOW_CLK Frequency Calculation	302
10.2.6	Interrupts	302
10.3	Configuration and Usage	303
10.3.1	Timer as a Simple Clock	303
10.3.2	Timer as One-shot Alarm	303
10.3.3	Timer as Periodic Alarm	303
10.3.4	SLOW_CLK Frequency Calculation	304
10.4	Register Summary	305
10.5	Registers	307
11	Watchdog Timers (WDT)	317

11.1	Overview	317
11.2	Digital Watchdog Timers	318
11.2.1	Features	318
11.2.2	Functional Description	319
11.2.2.1	Clock Source and 32-Bit Counter	319
11.2.2.2	Stages and Timeout Actions	320
11.2.2.3	Write Protection	320
11.2.2.4	Flash Boot Protection	321
11.3	Super Watchdog	321
11.3.1	Features	321
11.3.2	Super Watchdog Controller	321
11.3.2.1	Structure	322
11.3.2.2	Workflow	322
11.4	Interrupts	322
11.5	Registers	323
12	XTAL32K Watchdog Timers (XTWDT)	324
12.1	Overview	324
12.2	Features	324
12.2.1	Interrupt and Wake-Up	324
12.2.2	BACKUP32K_CLK	324
12.3	Functional Description	324
12.3.1	Workflow	325
12.3.2	BACKUP32K_CLK Working Principle	325
12.3.3	Configuring the Divisor Component of BACKUP32K_CLK	325
13	Permission Control (PMS)	327
13.1	Overview	327
13.2	Features	327
13.3	Internal Memory	327
13.3.1	ROM	328
13.3.1.1	Address	328
13.3.1.2	Access Configuration	328
13.3.2	SRAM	329
13.3.2.1	Address	329
13.3.2.2	Internal SRAM0 Access Configuration	329
13.3.2.3	Internal SRAM1 Access Configuration	330
13.3.2.4	Internal SRAM2 Access Configuration	334
13.3.3	RTC FAST Memory	335
13.3.3.1	Address	335
13.3.3.2	Access Configuration	335
13.3.4	RTC SLOW Memory	336
13.3.4.1	Address	336
13.3.4.2	Access Configuration	336
13.4	Peripherals	337
13.4.1	Access Configuration	337

13.4.2	Split Peripheral Regions into Split Regions	339
13.5	External Memory	339
13.5.1	Address	340
13.5.2	Access Configuration	340
13.5.3	GDMA	341
13.6	Unauthorized Access and Interrupts	342
13.6.1	Interrupt upon Unauthorized IBUS Access	342
13.6.2	Interrupt upon Unauthorized DBUS Access	343
13.6.3	Interrupt upon Unauthorized Access to External Memory	343
13.6.4	Interrupt upon Unauthorized Access to Internal Memory via GDMA	344
13.6.5	Interrupt upon Unauthorized peripheral bus (PIF) Access	344
13.6.6	Interrupt upon Unauthorized PIF Access Alignment	345
13.7	Protection of CPU VECBASE Registers	346
13.8	Register Locks	347
13.9	Register Summary	350
13.10	Registers	355
14	World Controller	445
14.1	Introduction	445
14.2	Features	445
14.3	Functional Description	445
14.4	CPU's World Switch	447
14.4.1	From Secure World to Non-secure World	447
14.4.2	From Non-secure World to Secure World	448
14.4.3	Clearing the write_buffer	449
14.5	World Switch Log	450
14.5.1	Structure of World Switch Log Register	450
14.5.2	How World Switch Log Registers are Updated	450
14.5.3	How to Read World Switch Log Registers	452
14.5.4	Nested Interrupts	453
14.5.4.1	How to Handle Nested Interrupts	453
14.5.4.2	Programming Procedure	453
14.6	NMI Interrupt Masking	454
14.7	Register Summary	456
14.8	Registers	457
15	System Registers	465
15.1	Overview	465
15.2	Features	465
15.3	Function Description	465
15.3.1	System and Memory Registers	465
15.3.1.1	Internal Memory	465
15.3.1.2	External Memory	466
15.3.1.3	RSA Memory	466
15.3.2	Clock Registers	467
15.3.3	Interrupt Signal Registers	467

15.3.4	Low-power Management Registers	467
15.3.5	Peripheral Clock Gating and Reset Registers	467
15.3.6	CPU Control Registers	469
15.4	Register Summary	470
15.5	Registers	471
16	SHA Accelerator (SHA)	485
16.1	Introduction	485
16.2	Features	485
16.3	Working Modes	485
16.4	Function Description	486
16.4.1	Preprocessing	486
16.4.1.1	Padding the Message	486
16.4.1.2	Parsing the Message	487
16.4.1.3	Initial Hash Value	487
16.4.2	Hash task Process	488
16.4.2.1	Typical SHA Mode Process	488
16.4.2.2	DMA-SHA Mode Process	490
16.4.3	Message Digest	492
16.4.4	Interrupt	493
16.5	Register Summary	493
16.6	Registers	494
17	AES Accelerator (AES)	499
17.1	Introduction	499
17.2	Features	499
17.3	AES Working Modes	499
17.4	Typical AES Working Mode	500
17.4.1	Key, Plaintext, and Ciphertext	500
17.4.2	Endianness	501
17.4.3	Operation Process	503
17.5	DMA-AES Working Mode	503
17.5.1	Key, Plaintext, and Ciphertext	504
17.5.2	Endianness	504
17.5.3	Standard Incrementing Function	505
17.5.4	Block Number	505
17.5.5	Initialization Vector	505
17.5.6	Block Operation Process	506
17.6	Memory Summary	506
17.7	Register Summary	507
17.8	Registers	508
18	RSA Accelerator (RSA)	512
18.1	Introduction	512
18.2	Features	512
18.3	Functional Description	512

18.3.1	Large Number Modular Exponentiation	512
18.3.2	Large Number Modular Multiplication	514
18.3.3	Large Number Multiplication	514
18.3.4	Options for Acceleration	515
18.4	Memory Summary	516
18.5	Register Summary	517
18.6	Registers	517
19	HMAC Accelerator (HMAC)	521
19.1	Main Features	521
19.2	Functional Description	521
19.2.1	Upstream Mode	521
19.2.2	Downstream JTAG Enable Mode	522
19.2.3	Downstream Digital Signature Mode	522
19.2.4	HMAC eFuse Configuration	522
19.2.5	HMAC Initialization	523
19.2.6	HMAC Process (Detailed)	523
19.3	HMAC Algorithm Details	525
19.3.1	Padding Bits	525
19.3.2	HMAC Algorithm Structure	526
19.4	Register Summary	528
19.5	Registers	530
20	Digital Signature (DS)	536
20.1	Overview	536
20.2	Features	536
20.3	Functional Description	536
20.3.1	Overview	536
20.3.2	Private Key Operands	537
20.3.3	Software Prerequisites	537
20.3.4	DS Operation at the Hardware Level	538
20.3.5	DS Operation at the Software Level	539
20.4	Memory Summary	541
20.5	Register Summary	542
20.6	Registers	543
21	External Memory Encryption and Decryption (XTS_AES)	545
21.1	Overview	545
21.2	Features	545
21.3	Module Structure	545
21.4	Functional Description	546
21.4.1	XTS Algorithm	546
21.4.2	Key	546
21.4.3	Target Memory Space	547
21.4.4	Data Padding	547
21.4.5	Manual Encryption Block	548

21.4.6	Auto Encryption Block	549
21.4.7	Auto Decryption Block	549
21.5	Software Process	550
21.6	Register Summary	551
21.7	Registers	552
22	Clock Glitch Detection	555
22.1	Overview	555
22.2	Functional Description	555
22.2.1	Clock Glitch Detection	555
22.2.2	Reset	555
23	Random Number Generator (RNG)	556
23.1	Introduction	556
23.2	Features	556
23.3	Functional Description	556
23.4	Programming Procedure	557
23.5	Register Summary	557
23.6	Register	557
24	UART Controller (UART)	558
24.1	Overview	558
24.2	Features	558
24.3	UART Structure	559
24.4	Functional Description	560
24.4.1	Clock and Reset	560
24.4.2	UART RAM	561
24.4.3	Baud Rate Generation and Detection	562
24.4.3.1	Baud Rate Generation	562
24.4.3.2	Baud Rate Detection	563
24.4.4	UART Data Frame	564
24.4.5	RS485	565
24.4.5.1	Driver Control	565
24.4.5.2	Turnaround Delay	565
24.4.5.3	Bus Snooping	565
24.4.6	IrDA	566
24.4.7	Wake-up	567
24.4.8	Loopback Test	567
24.4.9	Flow Control	567
24.4.9.1	Hardware Flow Control	568
24.4.9.2	Software Flow Control	569
24.4.10	GDMA Mode	569
24.4.11	UART Interrupts	570
24.4.12	UHCI Interrupts	571
24.5	Programming Procedures	571
24.5.1	Register Type	571

24.5.1.1	Synchronous Registers	572
24.5.1.2	Static Registers	573
24.5.1.3	Immediate Registers	574
24.5.2	Detailed Steps	574
24.5.2.1	Initializing UART n	574
24.5.2.2	Configuring UART n Communication	575
24.5.2.3	Enabling UART n	575
24.6	Register Summary	577
24.6.1	UART Register Summary	577
24.6.2	UHCI Register Summary	578
24.7	Registers	580
24.7.1	UART Registers	580
24.7.2	UHCI Registers	599
25	I2C Controller (I2C)	618
25.1	Overview	618
25.2	Features	618
25.3	I2C Architecture	619
25.4	Functional Description	621
25.4.1	Clock Configuration	621
25.4.2	SCL and SDA Noise Filtering	621
25.4.3	SCL Clock Stretching	622
25.4.4	Generating SCL Pulses in Idle State	622
25.4.5	Synchronization	622
25.4.6	Open-Drain Output	623
25.4.7	Timing Parameter Configuration	624
25.4.8	Timeout Control	625
25.4.9	Command Configuration	626
25.4.10	TX/RX RAM Data Storage	627
25.4.11	Data Conversion	628
25.4.12	Addressing Mode	628
25.4.13	R/\overline{W} Bit Check in 10-bit Addressing Mode	628
25.4.14	To Start the I2C Controller	629
25.5	Programming Example	629
25.5.1	I2C _{master} Writes to I2C _{slave} with a 7-bit Address in One Command Sequence	629
25.5.1.1	Introduction	629
25.5.1.2	Configuration Example	630
25.5.2	I2C _{master} Writes to I2C _{slave} with a 10-bit Address in One Command Sequence	631
25.5.2.1	Introduction	631
25.5.2.2	Configuration Example	631
25.5.3	I2C _{master} Writes to I2C _{slave} with Two 7-bit Addresses in One Command Sequence	632
25.5.3.1	Introduction	633
25.5.3.2	Configuration Example	633
25.5.4	I2C _{master} Writes to I2C _{slave} with a 7-bit Address in Multiple Command Sequences	634
25.5.4.1	Introduction	635
25.5.4.2	Configuration Example	636

25.5.5	I2C _{master} Reads I2C _{slave} with a 7-bit Address in One Command Sequence	637
25.5.5.1	Introduction	637
25.5.5.2	Configuration Example	638
25.5.6	I2C _{master} Reads I2C _{slave} with a 10-bit Address in One Command Sequence	639
25.5.6.1	Introduction	639
25.5.6.2	Configuration Example	640
25.5.7	I2C _{master} Reads I2C _{slave} with Two 7-bit Addresses in One Command Sequence	641
25.5.7.1	Introduction	641
25.5.7.2	Configuration Example	642
25.5.8	I2C _{master} Reads I2C _{slave} with a 7-bit Address in Multiple Command Sequences	643
25.5.8.1	Introduction	644
25.5.8.2	Configuration Example	645
25.6	Interrupts	646
25.7	Register Summary	648
25.8	Registers	650
26	LCD and Camera Controller (LCD_CAM)	670
26.1	Overview	670
26.2	Features	670
26.3	Functional Description	670
26.3.1	Block Diagram	670
26.3.2	Signal Description	671
26.3.3	LCD_CAM Module Clocks	672
26.3.3.1	LCD Clock	672
26.3.3.2	Camera Clock	673
26.3.4	LCD_CAM Reset	674
26.3.5	LCD_CAM Data Format Control	674
26.3.5.1	LCD Data Format Control	674
26.3.5.2	Camera Data Format Control	675
26.3.6	YUV-RGB Data Format Conversion	676
26.3.6.1	YUV Timing	677
26.3.6.2	Data Conversion Configuration	677
26.4	Software Configuration Process	678
26.4.1	Configure LCD (RGB Format) as TX Mode	679
26.4.2	Configure LCD (I8080/MOTO6800 Format) as TX Mode	680
26.4.3	Configure Camera as RX Mode	682
26.5	LCD_CAM Interrupts	683
26.6	Register Summary	684
26.7	Registers	685
27	Two-wire Automotive Interface (TWAI®)	698
27.1	Overview	698
27.2	Features	698
27.3	Functional Protocol	698
27.3.1	TWAI Properties	698
27.3.2	TWAI Messages	699

27.3.2.1	Data Frames and Remote Frames	700
27.3.2.2	Error and Overload Frames	702
27.3.2.3	Interframe Space	703
27.3.3	TWAI Errors	704
27.3.3.1	Error Types	704
27.3.3.2	Error States	704
27.3.3.3	Error Counters	705
27.3.4	TWAI Bit Timing	706
27.3.4.1	Nominal Bit	706
27.3.4.2	Hard Synchronization and Resynchronization	707
27.4	Architectural Overview	707
27.4.1	Registers Block	708
27.4.2	Bit Stream Processor	709
27.4.3	Error Management Logic	709
27.4.4	Bit Timing Logic	709
27.4.5	Acceptance Filter	709
27.4.6	Receive FIFO	709
27.5	Functional Description	710
27.5.1	Modes	710
27.5.1.1	Reset Mode	710
27.5.1.2	Operation Mode	710
27.5.2	Bit Timing	710
27.5.3	Interrupt Management	711
27.5.3.1	Receive Interrupt (RXI)	712
27.5.3.2	Transmit Interrupt (TXI)	712
27.5.3.3	Error Warning Interrupt (EWI)	712
27.5.3.4	Data Overrun Interrupt (DOI)	712
27.5.3.5	Error Passive Interrupt (TXI)	713
27.5.3.6	Arbitration Lost Interrupt (ALI)	713
27.5.3.7	Bus Error Interrupt (BEI)	713
27.5.3.8	Bus Status Interrupt (BSI)	713
27.5.4	Transmit and Receive Buffers	713
27.5.4.1	Overview of Buffers	713
27.5.4.2	Frame Information	714
27.5.4.3	Frame Identifier	715
27.5.4.4	Frame Data	716
27.5.5	Receive FIFO and Data Overruns	716
27.5.5.1	Single Filter Mode	717
27.5.5.2	Dual Filter Mode	717
27.5.6	Error Management	718
27.5.6.1	Error Warning Limit	718
27.5.6.2	Error Passive	720
27.5.6.3	Bus-Off and Bus-Off Recovery	720
27.5.7	Error Code Capture	720
27.5.8	Arbitration Lost Capture	721
27.6	Register Summary	723

27.7	Registers	724
28	USB On-The-Go (USB)	737
28.1	Overview	737
28.2	Features	737
28.2.1	General Features	737
28.2.2	Device Mode Features	737
28.2.3	Host Mode Features	737
28.3	Functional Description	738
28.3.1	Controller Core and Interfaces	738
28.3.2	Memory Layout	739
28.3.2.1	Control & Status Registers	740
28.3.2.2	FIFO Access	740
28.3.3	FIFO and Queue Organization	740
28.3.3.1	Host Mode FIFOs and Queues	741
28.3.3.2	Device Mode FIFOs	742
28.3.4	Interrupt Hierarchy	742
28.3.5	DMA Modes and Slave Mode	744
28.3.5.1	Slave Mode	744
28.3.5.2	Buffer DMA Mode	744
28.3.5.3	Scatter/Gather DMA Mode	744
28.3.6	Transaction and Transfer Level Operation	745
28.3.6.1	Transaction and Transfer Level in DMA Mode	745
28.3.6.2	Transaction and Transfer Level in Slave Mode	745
28.4	OTG	747
28.4.1	OTG Interface	747
28.4.2	ID Pin Detection	748
28.4.3	Session Request Protocol (SRP)	748
28.4.3.1	A-Device SRP	748
28.4.3.2	B-Device SRP	749
28.4.4	Host Negotiation Protocol (HNP)	750
28.4.4.1	A-Device HNP	750
28.4.4.2	B-Device HNP	751
29	USB Serial/JTAG Controller (USB_SERIAL_JTAG)	753
29.1	Overview	753
29.2	Features	753
29.3	Functional Description	755
29.3.1	USB Serial/JTAG host connection	755
29.3.2	CDC-ACM USB Interface Functional Description	757
29.3.3	CDC-ACM Firmware Interface Functional Description	758

PRELIMINARY

1 ULP Coprocessor (ULP-FSM, ULP-RISC-V)

1.1 Overview

The ULP coprocessor is an ultra-low-power processor that remains powered on when the chip is in Deep-sleep (see Chapter 5 *Low-Power Management (RTC_CNTL) [to be added later]*). Hence, users can store in RTC memory a program for the ULP coprocessor to access RTC peripherals, internal sensors, and RTC registers during Deep-sleep.

In power-sensitive scenarios, the main CPU goes to sleep mode to lower power consumption. Meanwhile, the coprocessor is woken up by ULP timer, and then monitors the external environment or interacts with the external circuit by controlling peripherals such as RTC GPIO, RTC I2C, SAR ADC, or temperature sensor (TSENS). The coprocessor wakes the main CPU up once a wakeup condition is reached.

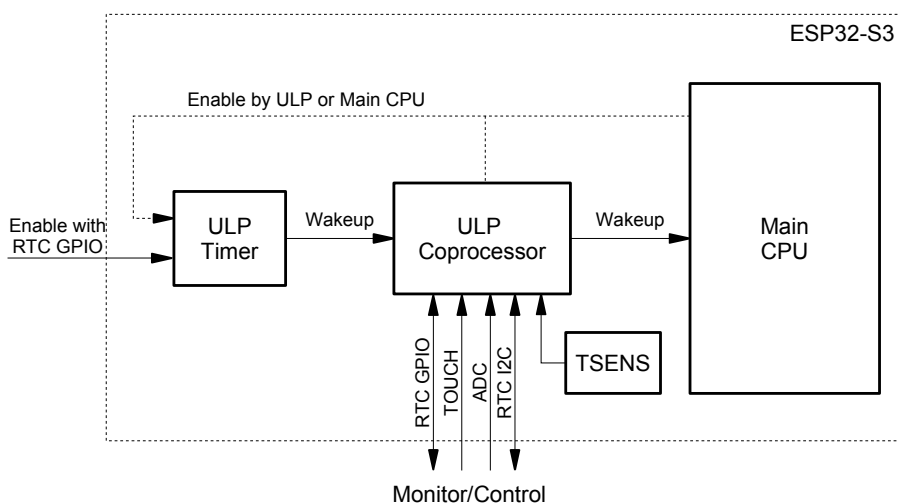

Figure 1-1. ULP Coprocessor Overview

ESP32-S3 has two ULP coprocessors, with one based on RISC-V instruction set architecture (ULP-RISC-V) and the other on finite state machine (ULP-FSM). Users can choose between the two coprocessors depending on their needs.

1.2 Features

- Access up to 8 KB of SRAM RTC slow memory for instructions and data
- Clocked with 17.5 MHz RTC_FAST_CLK
- Support working in normal mode and in monitor mode
- Wake up the CPU or send an interrupt to the CPU
- Access peripherals, internal sensors and RTC registers

ULP-FSM and ULP-RISC-V can not be used simultaneously. Users can only choose one of them as the ULP coprocessor of ESP32-S3. The differences between the two coprocessors are shown in the table below.

Table 1-1. Comparison of the Two Coprocessors

Feature		ULP Coprocessors	
		ULP-FSM	ULP-RISC-V
Memory (RTC Slow Memory)		8 KB	
Work Clock Frequency		17.5 MHz	
Wakeup Source		ULP Timer	
Work Mode	Normal Mode	Assist the main CPU to complete some tasks after the chip is woken up.	
	Monitor Mode	Retrieve data from sensors to monitor environment, when the chip is in sleep.	
Control Low-Power Peripherals		ADC1/ADC2	
		RTC I2C	
		RTC GPIO	
		Touch Sensors	
		Temperature Sensor	
Architecture		Programmable FSM	RISC-V
Development		Special instruction set	Standard C compiler

ULP coprocessor can access the modules in RTC domain via RTC registers. In many cases the ULP coprocessor can be a good supplement to, or replacement of, the main CPU, especially for power-sensitive applications. Figure 1-2 shows the overall layout of ESP32-S3 coprocessor.

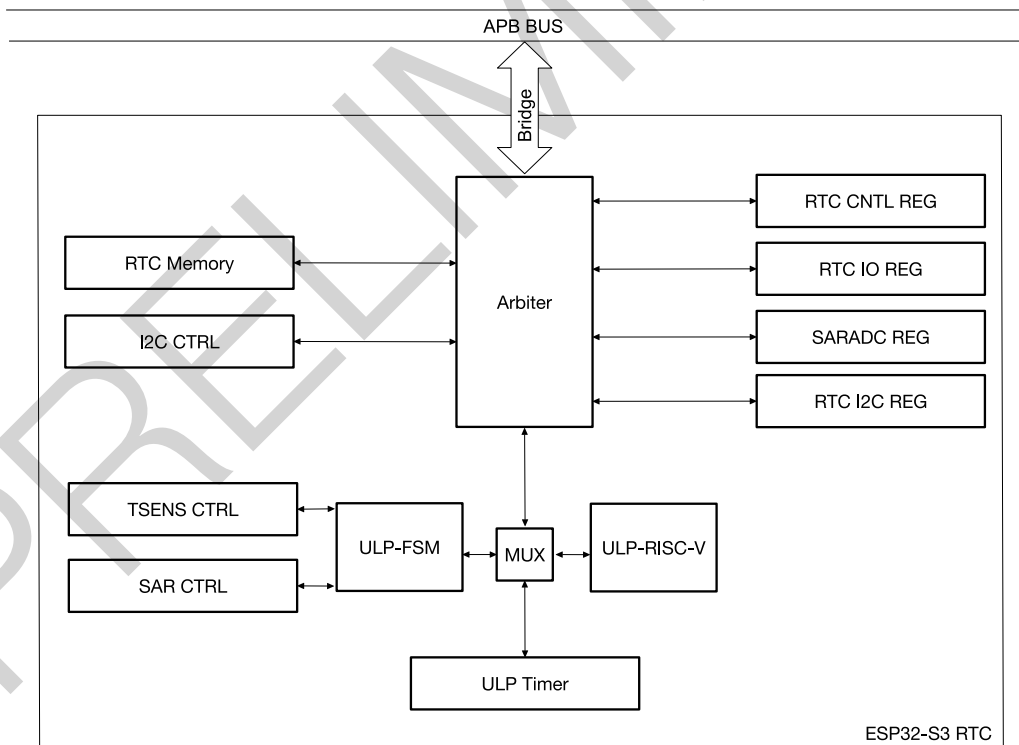

Figure 1-2. ULP Coprocessor Diagram

1.3 Programming Workflow

The ULP-RISC-V is intended for programming using C language. The program in C is then compiled to

[RV32IMC](#) standard instruction code. The ULP-FSM is using custom instructions normally not supported by high-level programming language. Users develop their programs using ULP-FSM instructions (see Section 1.5.2).

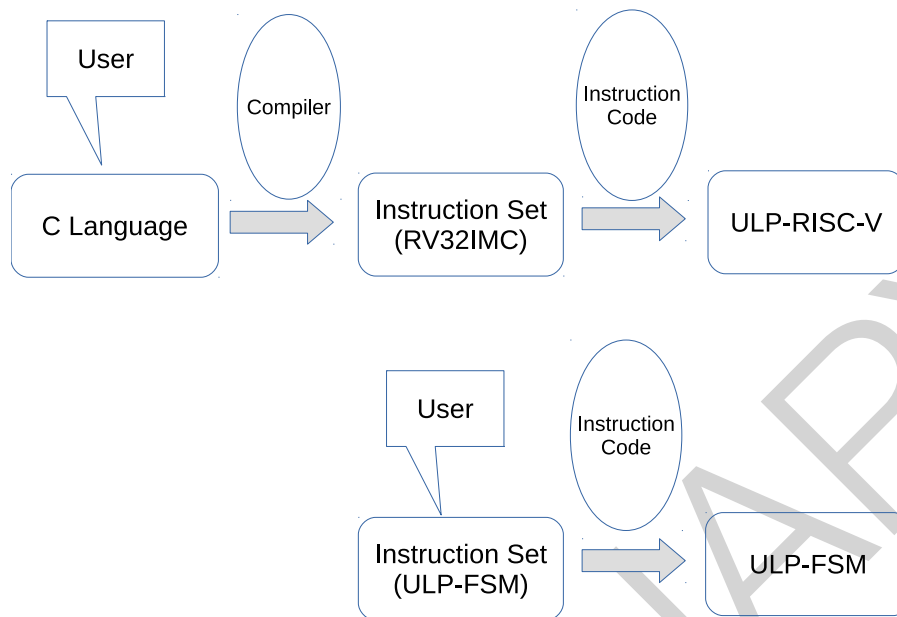

Figure 1-3. Programming Workflow

1.4 ULP Coprocessor Sleep and Wakeup Workflow

ULP coprocessor is designed to operate independently of the CPU, while the CPU is either in sleep or running.

In a typical power-saving scenario, the chip goes to Deep-sleep mode to lower power consumption. Before setting the chip to sleep mode, users should complete the following operations.

1. Flash the program to be executed by ULP coprocessor into RTC slow memory.
2. Select the working ULP coprocessor by configuring `RTC_CNTL_COCPU_SEL`.
 - 0: select ULP-RISC-V
 - 1: select ULP-FSM
3. If ULP-RISC-V is selected as working ULP coprocessor, please
 - set and reset `RTC_CNTL_COCPU_CLK_FO`;
 - set `RTC_CNTL_COCPU_CLKGATE_EN`.
4. Set sleep cycles for the timer by configuring `RTC_CNTL_ULP_CP_TIMER_1_REG`.
5. Enable the timer by software or by RTC GPIO;
 - By software: set `RTC_CNTL_ULP_CP_SLP_TIMER_EN`.
 - By RTC GPIO: set `RTC_CNTL_ULP_CP_GPIO_WAKEUP_ENA`.
6. Set the system into sleep mode.

When the system is in Deep-sleep mode:

1. The timer periodically sets the low-power controller (see Chapter 5 *Low-Power Management (RTC_CNTL)* [to be added later]) to Monitor mode and then wakes up the coprocessor.
2. Coprocessor executes some necessary operations, such as monitoring external environment via low-power sensors.
3. After the operations are finished, the system goes back to Deep-sleep mode.
4. ULP coprocessor goes back to halt mode and waits for next wakeup.

In monitor mode, ULP coprocessor is woken up and goes to halt as shown in Figure 1-4.

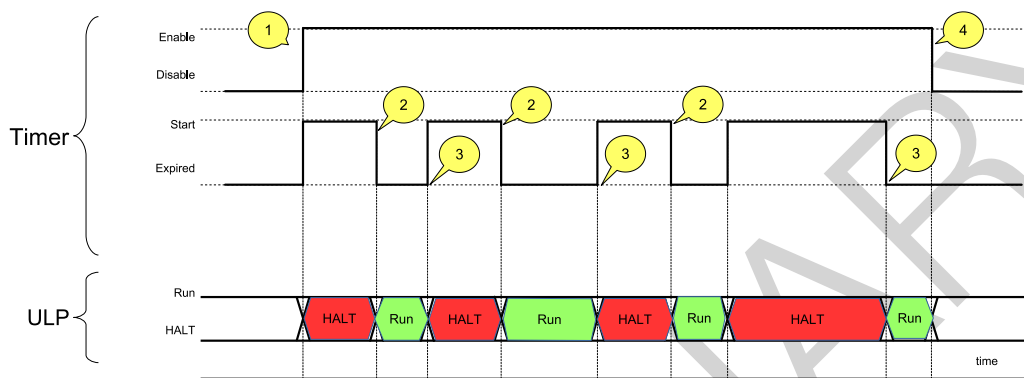

Figure 1-4. ULP Sleep and Wakeup Sequence

1. Enable the timer and the timer starts counting.
2. The timer expires and wakes up the ULP coprocessor. ULP coprocessor starts running and executes the program flashed in RTC slow memory.
3. ULP coprocessor goes to halt and the timer starts counting again.
 - Put ULP-RISC-V into HALT: set `RTC_CNTL_COCPU_DONE`.
 - Put ULP-FSM into HALT: execute HALT instruction.
4. Disable the timer by ULP program or by software. ULP coprocessor exits from monitor mode.
 - Disabled by software: clear `RTC_CNTL_ULP_CP_SLP_TIMER_EN`.
 - Disabled by RTC GPIO: clear `RTC_CNTL_ULP_CP_GPIO_WAKEUP_ENA` and set `RTC_CNTL_ULP_CP_GPIO_WAKEUP_CLR`.

Note:

- If the timer is enabled by software (RTC GPIO), it should be disabled by software (RTC GPIO).
- Before setting ULP-RISC-V to HALT, users should configure `RTC_CNTL_COCPU_DONE` first, therefore, it is recommended to end the flashed program with the following pattern:
 - Set `RTC_CNTL_COCPU_DONE` to end the operation of ULP-RISC-V and put it into halt;
 - Set `RTC_CNTL_COCPU_SHUT_RESET_EN` to reset ULP-RISC-V.

Enough time is reserved for the ULP-RISC-V to complete the operations above before it goes to halt.

Figure 1-5 shows the relationship between the signals and register bits.

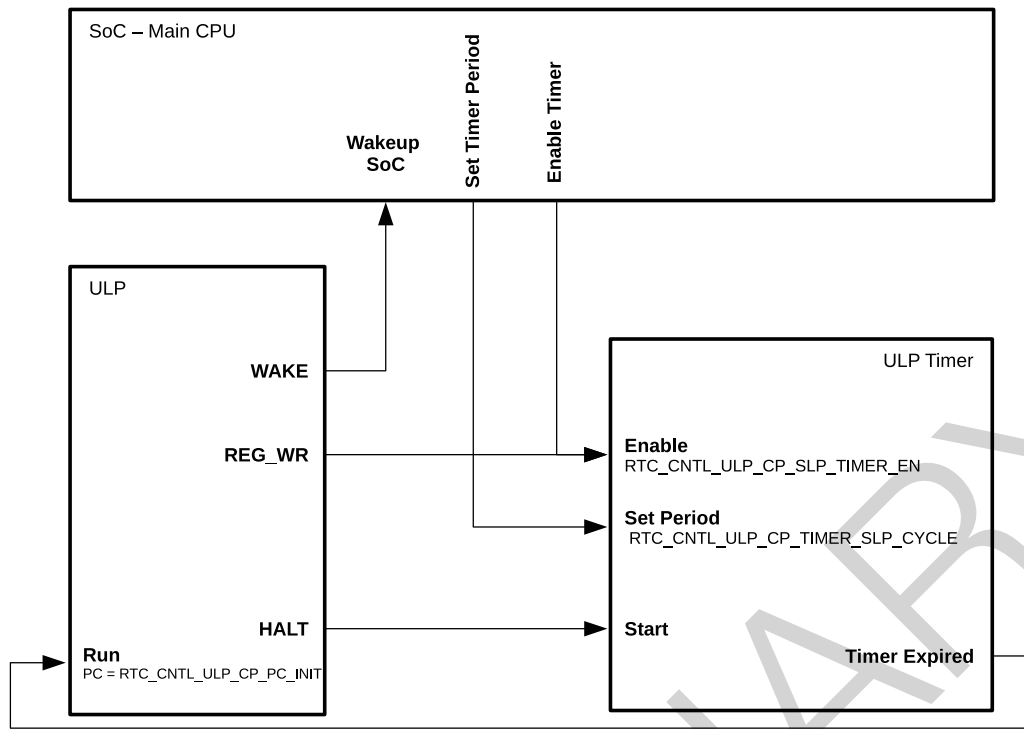

Figure 1-5. Control of ULP Program Execution

1.5 ULP-FSM

1.5.1 Features

ULP-FSM is a programmable finite state machine that can work while the main CPU is in Deep-sleep. ULP-FSM supports instructions for complex logic and arithmetic operations, and also provides dedicated instructions for RTC controllers or peripherals. ULP-FSM can access up to 8 KB of SRAM RTC slow memory (accessible by the CPU) for instructions and data. Hence, such memory is usually used to store instructions and share data between the ULP coprocessor and the CPU. ULP-FSM can be stopped by running HALT instruction.

ULP-FSM has the following features.

- Provides four 16-bit general-purpose registers (R0, R1, R2, and R3) for manipulating data and accessing memory.
- Provides one 8-bit stage count register (Stage_cnt) which can be manipulated by ALU and used in JUMP instructions.
- Supports built-in instructions specially for direct control of low-power peripherals, such as SAR ADC and temperature sensor.

1.5.2 Instruction Set

ULP-FSM supports the following instructions.

- ALU: perform arithmetic and logic operations
- LD, ST, REG_RD and REG_WR: load and store data
- JUMP: jump to a certain address

- WAIT/HALT: manage program execution
- WAKE: wake up CPU or communicate with CPU
- TSENS and ADC: take measurements

Figure 1-6 shows the format of ULP-FSM instructions.

Figure 1-6. ULP-FSM Instruction Format

An instruction, which has one OpCode, can perform various operations, depending on the setting of Operands bits. A good example is the ALU instruction, which is able to perform 10 arithmetic and logic operations; or the JUMP instruction, which may be conditional or unconditional, absolute or relative.

Each instruction has a fixed width of 32 bits. A series of instructions can make a program be executed by the coprocessor. The execution flow inside the program uses 32-bit addressing. The program is stored in a dedicated region called Slow Memory, which is visible to the main CPU under an address range of 0x5000_0000 to 0x5000_1FFF (8 KB).

1.5.2.1 ALU - Perform Arithmetic and Logic Operations

ALU (Arithmetic and Logic Unit) performs arithmetic and logic operations on values stored in ULP coprocessor registers, and on immediate values stored in the instruction itself. The following operations are supported.

- Arithmetic: ADD and SUB
- Logic: AND and OR
- Bit shifting: LSH and RSH
- Moving data to register: MOVE
- PC register operations - STAGE_RST, STAGE_INC, and STAGE_DEC

The ALU instruction, which has one OpCode (7), can perform various arithmetic and logic operations, depending on the setting of the instruction bits [27:21].

Operations Among Registers

Figure 1-7. Instruction Type – ALU for Operations Among Registers

When bits [27:26] of the instruction in Figure 1-7 are set to 0, ALU performs operations on the data stored in ULP-FSM registers R[0-3]. The types of operations depend on the setting of the instruction bits ALU_sel[24:21] presented in Table 1-2.

Operand Description - see Figure 1-7

- Rdst* Register R[0-3], destination
- Rsrc1* Register R[0-3], source
- Rsrc2* Register R[0-3], source
- ALU_sel* ALU operation selection, see Table 1-2

ALU_sel	Instruction	Operation	Description
0	ADD	$Rdst = Rsrc1 + Rsrc2$	Add to register
1	SUB	$Rdst = Rsrc1 - Rsrc2$	Subtract from register
2	AND	$Rdst = Rsrc1 \& Rsrc2$	Logical AND of two operands
3	OR	$Rdst = Rsrc1 Rsrc2$	Logical OR of two operands
4	MOVE	$Rdst = Rsrc1$	Move to register
5	LSH	$Rdst = Rsrc1 \ll Rsrc2$	Logical shift left
6	RSH	$Rdst = Rsrc1 \gg Rsrc2$	Logical shift right

Table 1-2. ALU Operations Among Registers

Note:

- ADD or SUB operations can be used to set or clear the overflow flag in ALU.
- All ALU operations can be used to set or clear the zero flag in ALU.

Operations with Immediate Value

Figure 1-8. Instruction Type — ALU for Operations with Immediate Value

When bits [27:26] of the instruction in Figure 1-8 are set to 1, ALU performs operations using register R[0-3] and the immediate value stored in instruction bits [19:4]. The types of operations depend on the setting of the instruction bits ALU_sel[24:21] presented in Table 1-3.

Operand Description - see Figure 1-8

- Rdst* Register R[0-3], destination
- Rsrc1* Register R[0-3], source
- Imm* 16-bit signed immediate value
- ALU_sel* ALU operation selection, see Table 1-3

Note:

- ADD or SUB operations can be used to set or clear the overflow flag in ALU.
- All ALU operations can be used to set or clear the zero flag in ALU.

Operations with Stage Count Register

Operand Description - see Figure 1-10

- Rdst* Register R[0-3], address of the destination, expressed in 32-bit words
- Rsrc* Register R[0-3], 16-bit value to store
- label* Data label, 2-bit user defined unsigned value
- upper* 0: write the low half-word; 1: write the high half-word
- wr_way* 0: write the full-word; 1: with the label; 3: without the label
- offset* 11-bit signed value, expressed in 32-bit words
- wr_auto* Enable automatic storage mode
- offset_set* Offset enable bit.
0: Do not configure the offset for automatic storage mode.
1: Configure the offset for automatic storage mode.
- manul_en* Enable manual storage mode

Automatic Storage Mode

Figure 1-11. Instruction Type - Offset in Automatic Storage Mode (ST-OFFSET)

Operand Description - see Figure 1-11

- offset* Initial address offset, 11-bit signed value, expressed in 32-bit words

Figure 1-12. Instruction Type - Data Storage in Automatic Storage Mode (ST-AUTO-DATA)

Operand Description - See Figure 1-12

- Rdst* Register R[0-3], address of the destination, expressed in 32-bit words
- Rsrc* Register R[0-3], 16-bit value to store
- label* Data label, 2-bit user defined unsigned value
- wr_way* 0: write the full-word; 1: with the label; 3: without the label

Description

This mode is used to access continuous addresses. Before using this mode for the first time, please configure the initial address using ST-OFFSET instruction. Executing the instruction ST-AUTO-DATA will store the 16-bit data in *Rsrc* into the memory address *Rdst* + *Offset*, see Table 1-5. Write_cnt here indicates the times of the instruction ST-AUTO-DATA executed.

wr_way	write_cnt	Store Data	Operation
0	*	Mem [Rdst + Offset]{31:0} = {PC[10:0],3'b0,Label[1:0],Rsrc[15:0]}	Write full-word, including the pointer and the data
1	odd	Mem [Rdst + Offset]{15:0} = {Label[1:0],Rsrc[13:0]}	Store the data with label in the low half-word
1	even	Mem [Rdst + Offset]{31:16} = {Label[1:0],Rsrc[13:0]}	Store the data with label in the high half-word
3	odd	Mem [Rdst + Offset]{15:0} = Rsrc[15:0]}	Store the data without label in the low half-word
3	even	Mem [Rdst + Offset]{31:16} = Rsrc[15:0]}	Store the data without label in the high half-word

Table 1-5. Data Storage Type - Automatic Storage Mode

The full-word written to RTC memory is built as follows:

Figure 1-13. Data Structure of RTC_SLOW_MEM[Rdst + Offset]

Bits	Description
bits [15:0]	store the content of Rsrc
bits [17:16]	data label, 2-bit user defined unsigned value
bits [20:18]	3'b0 by default
bits [31:21]	hold the PC of current instruction, expressed in 32-bit words

Note:

- When full-word is written, the offset will be automatically incremented by 1 after each ST-AUTO-DATA execution.
- When half-word is written (low half-word first), the offset will be automatically incremented by 1 after twice ST-AUTO-DATA execution.
- This instruction can only access 32-bit memory words.
- The “Mem” written is the RTC_SLOW_MEM memory. Address 0, as seen by the ULP coprocessor, corresponds to address 0x50000000, as seen by the main CPU.

Manual Storage Mode

Figure 1-14. Instruction Type - Data Storage in Manual Storage Mode

Operand Description - See Figure 1-14

- Rdst* Register R[0-3], address of the destination, expressed in 32-bit words
- Rsrc* Register R[0-3], 16-bit value to store
- label* Data label, 2-bit user defined unsigned value
- upper* 0: Write the low half-word; 1: write the high half-word
- wr_way* 0: Write the full-word; 1: with the label; 3: without the label
- offset* 11-bit signed value, expressed in 32-bit words

Description

Manual storage mode is mainly used for storing data into discontinuous addresses. Each instruction needs a storage address and offset. The detailed storage methods are shown in Table 1-6.

<i>wr_way</i>	<i>upper</i>	Data	Operation
0	*	Mem [Rdst + Offset]{31:0} = {PC[10:0],3'b0, Label[1:0],Rsrc[15:0]}	Write full-word, including the pointer and the data
1	0	Mem [Rdst + Offset]{15:0} = {Label[1:0],Rsrc[13:0]}	Store the data with label in the low half-word
1	1	Mem [Rdst + Offset]{31:16} = {Label[1:0],Rsrc[13:0]}	Store the data with label in the high half-word
3	0	Mem [Rdst + Offset]{15:0} = Rsrc[15:0]	Store the data without label in the low half-word
3	1	Mem [Rdst + Offset]{31:16} = Rsrc[15:0]	Store the data without label in the high half-word

Table 1-6. Data Storage - Manual Storage Mode

1.5.2.3 LD – Load Data from Memory

Figure 1-15. Instruction Type - LD

Operand Description - see Figure 1-15

- Rdst* Register R[0-3], destination
- Rsrc* Register R[0-3], address of destination memory, expressed in 32-bit words
- Offset* 11-bit signed value, expressed in 32-bit words
- rd_upper* Choose which half-word to read:
 1 - read the high half-word
 0 - read the low half-word

Description

This instruction loads the low or high 16-bit half-word, depending on *rd_upper*, from memory with address *Rsrc* + *offset* into the destination register *Rdst*:

$$Rdst[15:0] = Mem[Rsrc + Offset]$$

Note:

- This instruction can only access 32-bit memory words.
- The “Mem” loaded is the RTC_SLOW_MEM memory. Address 0, as seen by the ULP coprocessor, corresponds to address 0x50000000, as seen by the main CPU.

1.5.2.4 JUMP – Jump to an Absolute Address**Figure 1-16. Instruction Type - JUMP****Operand Description** - see Figure 1-16

Rdst Register R[0-3], containing address to jump to (expressed in 32-bit words)

ImmAddr 11-bit address, expressed in 32-bit words

Sel Select the address to jump to:
 0 - jump to the address stored in *ImmAddr*
 1 - jump to the address stored in *Rdst*

Type Jump type:
 0 - make an unconditional jump
 1 - jump only if the last ALU operation has set zero flag
 2 - jump only if the last ALU operation has set overflow flag

Note:

All jump addresses are expressed in 32-bit words.

Description

The instruction executes a jump to a specified address. The jump can be either unconditional or based on the ALU flag.

1.5.2.5 JUMPR – Jump to a Relative Address (Conditional upon R0)**Figure 1-17. Instruction Type - JUMPR**

Operand Description - see Figure 1-17*Threshold* Threshold value for condition (see *Cond* below) to jump

Cond Condition to jump:

- 0 - jump if $R0 < Threshold$
- 1 - jump if $R0 > Threshold$
- 2 - jump if $R0 = Threshold$

Step Relative shift from current position, expressed in 32-bit words:

- if $Step[7] = 0$, then $PC = PC + Step[6:0]$
- if $Step[7] = 1$, then $PC = PC - Step[6:0]$

Note:

All jump addresses are expressed in 32-bit words.

Description

The instruction executes a jump to a relative address, if the condition is true. The condition is the result of comparing the R0 register value and the *Threshold* value.

1.5.2.6 JUMPS – Jump to a Relative Address (Conditional upon Stage Count Register)

Figure 1-18. Instruction Type - JUMPS

Operand Description - see Figure 1-18*Threshold* Threshold value for condition (see *Cond* below) to jump

Cond Condition to jump:

- 1X - jump if $Stage_cnt \leq Threshold$
- 00 - jump if $Stage_cnt < Threshold$
- 01 - jump if $Stage_cnt \geq Threshold$

Step Relative shift from current position, expressed in 32-bit words:

- if $Step[7] = 0$, then $PC = PC + Step[6:0]$
- if $Step[7] = 1$, then $PC = PC - Step[6:0]$

Note:

- For more information about the stage count register, please refer to Section 1.5.2.1.
- All jump addresses are expressed in 32-bit words.

Description

The instruction executes a jump to a relative address if the condition is true. The condition itself is the result of comparing the value of *Stage_cnt* (stage count register) and the *Threshold* value.

1.5.2.7 HALT – End the Program

31	28	27			0
11					

Figure 1-19. Instruction Type - HALT

Description

The instruction ends the operation of the ULP-FSM and puts it into power-down mode.

Note:

After executing this instruction, the ULP coprocessor wakeup timer gets started.

1.5.2.8 WAKE – Wake up the Chip

31	28	27	26	25			1	0	
9		0						1'b1	

Figure 1-20. Instruction Type - WAKE

Description

This instruction sends an interrupt from the ULP-FSM to the RTC controller.

- If the chip is in Deep-sleep mode, and the ULP wakeup timer is enabled, the above-mentioned interrupt will wake up the chip.
- If the chip is not in Deep-sleep mode, and the ULP interrupt bit `RTC_CNTL_ULP_CP_INT_ENA` is set in register `RTC_CNTL_INT_ENA_REG`, an RTC interrupt will be triggered.

1.5.2.9 WAIT – Wait for a Number of Cycles

31	28	27			16	15			0
4									

Cycles

Figure 1-21. Instruction Type - WAIT

Operand Description - see Figure 1-21

Cycles The number of cycles to wait

Description

The instruction will delay the ULP-FSM for a given number of cycles.

1.5.2.10 TSENS – Take Measurement with Temperature Sensor

Figure 1-22. Instruction Type - TSENS

Operand **Description** - see Figure 1-22

Rdst Destination Register R[0-3], results will be stored in this register.

Wait_Delay Number of cycles used to perform the measurement.

Description

Increasing the measurement cycles *Wait_Delay* helps improve the accuracy and optimize the result. The instruction performs measurement via temperature sensor and stores the result into a general purpose register.

1.5.2.11 ADC – Take Measurement with ADC

Figure 1-23. Instruction Type - ADC

Operand **Description** - see Figure 1-23

Rdst Destination Register R[0-3], results will be stored in this register.

Sar_Mux Enable SAR ADC channel. Channel No. is [*Sar_Mux* - 1]. For more information, see Chapter 4 *On-Chip Sensors and Analog Signal Processing [to be added later]*.

Sel Select ADC. 0: select SAR ADC1; 1: select SAR ADC2, see Table 1-7.

Table 1-7. Input Signals Measured Using the ADC Instruction

Pad/Signal/GPIO	<i>Sar_Mux</i>	ADC Selection (<i>Sel</i>)
GPIO1	1	<i>Sel</i> = 0, select SAR ADC1
GPIO2	2	
GPIO3	3	
GPIO4	4	
GPIO5	5	
GPIO6	6	
GPIO7	7	
GPIO8	8	
GPIO9	9	
GPIO10	10	

Pad/Signal/GPIO	Sar_Mux	ADC Selection Sel
GPIO11	1	Sel = 1, select SAR ADC2
GPIO12	2	
GPIO13	3	
GPIO14	4	
XTAL_32k_P	5	Sel = 1, select SAR ADC2
XTAL_32k_N	6	
GPIO17	7	
GPIO18	8	
GPIO19	9	
GPIO20	10	

1.5.2.12 REG_RD – Read from Peripheral Register

Figure 1-24. Instruction Type - REG_RD

Operand Description - see Figure 1-24

Addr Peripheral register address, in 32-bit words

Low Register start bit number

High Register end bit number

Description

The instruction reads up to 16 bits from a peripheral register into a general-purpose register:

$$R0 = \text{REG}[\text{Addr}][\text{High}:\text{Low}]$$

In case of more than 16 bits being requested, i.e. $\text{High} - \text{Low} + 1 > 16$, then the instruction will return $[\text{Low}+15:\text{Low}]$.

Note:

- This instruction can access registers in RTC_CNTL, RTC_IO, SENS, and RTC_I2C peripherals. Address of the register, as seen from the ULP coprocessor (*addr_ulp*), can be calculated from the address of the same register on the main bus (*addr_bus*), as follows:

$$\text{addr_ulp} = (\text{addr_bus} - \text{DR_REG_RTCCNTL_BASE})/4$$

- The *addr_ulp* is expressed in 32-bit words (not in bytes), and value 0 maps onto the DR_REG_RTCCNTL_BASE (as seen from the main CPU). Thus, 10 bits of address cover a 4096-byte range of peripheral register space, including regions DR_REG_RTCCNTL_BASE (0x6000800), DR_REG_RTCIO_BASE (0x60008400), DR_REG_SENS_BASE (0x60008800), and DR_REG_RTC_I2C_BASE (0x60008C00). For more information about address mapping, see Section 1.8.

1.5.2.13 REG_WR – Write to Peripheral Register

Figure 1-25. Instruction Type - REG_WR

Operand **Description** - see Figure 1-25

Addr Register address, expressed in 32-bit words

Data Value to write, 8 bits

Low Register start bit number

High Register end bit number

Description

This instruction writes up to 8 bits from an immediate data value into a peripheral register.

$$\text{REG}[\text{Addr}][\text{High:Low}] = \text{Data}$$

If more than 8 bits are requested, i.e. $\text{High} - \text{Low} + 1 > 8$, then the instruction will pad with zeros the bits above the eighth bit.

Note:

See notes regarding *addr_ulp* in Section 1.5.2.12.

1.6 ULP-RISC-V

1.6.1 Features

- Support [RV32IMC](#) instruction set
- Thirty-two 32-bit general-purpose registers
- 32-bit multiplier and divider
- Support for interrupts

1.6.2 Multiplier and Divider

ULP-RISC-V has an independent multiplication and division unit. The efficiency of multiplication and division instructions is shown in the following table.

Table 1-8. Instruction Efficiency

Operation	Instruction	Execution Cycle	Instruction Description
Multiply	MUL	34	Multiply two 32-bit integers and return the lower 32-bit of the result
	MULH	66	Multiply two 32-bit signed integers and return the higher 32-bit of the result
	MULHU	66	Multiply two 32-bit unsigned integers and return the higher 32-bit of the result
	MULHSU	66	Multiply a 32-bit signed integer with a unsigned integer and return the higher 32-bit of the result

Operation	Instruction	Execution Cycle	Instruction Description
Divide	DIV	34	Divide a 32-bit integer by a 32-bit integer and return the quotient
	DIVU	34	Divide a 32-bit unsigned integer by a 32-bit unsigned integer and return the quotient
	REM	34	Divide a 32-bit signed integer by a 32-bit signed integer and return the remainder
	REMU	34	Divide a 32-bit unsigned integer by a 32-bit unsigned integer and return the remainder

1.6.3 ULP-RISC-V Interrupts

1.6.3.1 Introduction

The interrupt controller of ULP-RISC-V is implemented by using a customized instruction set, instead of RISC-V Privileged ISA specification, aiming to reduce the size of ULP-RISC-V.

1.6.3.2 Interrupt Controller

ULP-RISC-V has 32 interrupt sources, but only four of them are available in the real design, as shown in the table below, including:

- internal sources: INT 0 ~ INT 2, triggered by internal interrupt events.
- external source: INT 31, triggered by the peripheral interrupts of ESP32-S3.

Type	IRQ	Triggered by
Internal	0	Internal timer interrupt
Internal	1	EBREAK/ECALL or Illegal Instruction
Internal	2	BUS Error (Unaligned Memory Access)
External	31	RTC peripheral interrupts

Table 1-9. ULP-RISC-V Interrupt Sources

Note:

If illegal instruction interrupt or bus error interrupt is disabled, ULP-RISC-V goes to HALT when the two errors occur.

ULP-RISC-V provides four 32-bit interrupt registers, Q0 ~ Q3, to handle interrupt service routine (ISR). Table 1-10 shows the function of each register.

Register	Function
Q0	Store the returned address. If the interrupt instruction is a compressed one, the lowest bit of this register will be set.
Q1	Bitmap. If the corresponding bit of an interrupt is set, this interrupt will trigger its ISR.
Q2	Reserved. An option for ISR to store data.
Q3	Reserved. An option for ISR to store data.

Table 1-10. ULP-RISC-V Interrupt Registers

Note:

- If more than one bits in Q1 are set, all the corresponding interrupts will call the same ISR. For such reason, users need to program ISR to check the interrupt number and execute corresponding program.
- After ULP-RISC-V is reset, all the interrupts are disabled.

1.6.3.3 Interrupt Instructions

All these interrupt instructions are standard R-type instructions, with the same OpCode of custom0 (0001011). Figure 1-26 shows the format of standard R-type instructions. Note the fields funct3 (f3) and rs2 are ignored in these instructions.

Figure 1-26. Standard R-type Instruction Format

Instruction: getq rd,qs

This instruction copies the value of Q_x into a general purpose register rd.

Figure 1-27. Interrupt Instruction - getq rd, qs

Operand Description - See Figure 1-27

- rd* Target general purpose register, holds the value of interrupt register specified by qs.
- qs* Address of interrupt register Q_x.
- f7* Interrupt instruction number.

Instruction: setq qd,rs

This instruction copies the value of general purpose register rs to Q_x.

Figure 1-28. Interrupt Instruction - setq,qd,rs

Operand Description - See Figure 1-28

- qd* Target interrupt register
- rs* Source general purpose register, stores the value to be written to interrupt register.
- f7* Interrupt instruction number.

Instruction: retirq

This instruction copies the value of Q0 to CPU PC, and enables interrupt again.

Figure 1-29. Interrupt Instruction - maskirq

Operand Description - See Figure 1-29

- f7* Interrupt instruction number.

Instruction: maskirq rd,rs

This instruction copies the value of Q1 to the register rd, and copies the value of register rs to Q1.

Figure 1-30. Interrupt Instruction — Maskirq rd rs

Operand Description - See Figure 1-30

- rd* Target general purpose register, stores current value of register Q1.
- rs* Source general purpose register, stores the value to be written to Q1.
- f7* Interrupt instruction number.

1.6.3.4 RTC Peripheral Interrupts

The interrupts from some sensors, software, and RTC I2C can be routed to ULP-RISC-V. To enable the interrupts, please set the register [SENS_SAR_COCPU_INT_ENA_REG](#), see Table 1-11.

Enable bit	Interrupt	Description
0	TOUCH_DONE_INT	Triggered when the touch sensor completes the scan of a channel
1	TOUCH_INACTIVE_INT	Triggered when the touch pad is released
2	TOUCH_ACTIVE_INT	Triggered when the touch pad is touched
3	SARADC1_DONE_INT	Triggered when SAR ADC1 completes the conversion one time
4	SARADC2_DONE_INT	Triggered when SAR ADC2 completes the conversion one time
5	TSENS_DONE_INT	Triggered when the temperature sensor completes the dump of its data
6	RISCV_START_INT	Triggered when ULP-RISC-V powers on and starts working
7	SW_INT	Triggered by software
8	SWD_INT	Triggered by timeout of Super Watchdog (SWD)
9	TOUCH_TIME_OUT_INT	Triggered by touch pad sampling timeout
10	TOUCH_APPROACH_LOOP_DONE_INT	Triggered when touch pad completes an APPROACH sampling
11	TOUCH_SCAN_DONE_INT	Triggered when touch pad completes the scan of the final channel

Table 1-11. ULP-RISC-V Interrupt List

Note:

- Besides the above-mentioned interrupts, ULP-RISC-V can also handle the interrupt from RTC_IO by simply configuring RTC_IO as input mode. Users can configure `RTCIO_GPIO_PINn_INT_TYPE` to select the interrupt trigger modes, but only level trigger modes are available. For more details about RTC_IO configuration, see Chapter 5 *IO MUX and GPIO Matrix (GPIO, IO MUX)*.
- The interrupt from RTC_IO can be cleared by releasing RTC_IO and its source can be read from the register `RTCIO_RTC_GPIO_STATUS_REG`.
- The SW_INT interrupt is generated by configuring the register `RTC_CNTL_COCPU_SW_INT_TRIGGER`.
- For the information about RTC I2C interrupts, please refer to Section 1.7.4.

1.7 RTC I2C Controller

ULP coprocessor reads from or writes to external I2C slave devices via RTC I2C controller.

1.7.1 Connecting RTC I2C Signals

SDA and SCL signals can be mapped onto two out of the four GPIO pins, which are identified in Table RTC_MUX Pad List in Chapter 5 *IO MUX and GPIO Matrix (GPIO, IO MUX)*, using the register `RTCIO_SAR_I2C_IO_REG`.

1.7.2 Configuring RTC I2C

Before ULP coprocessor can communicate using I2C instruction, RTC I2C need to be configured. Configuration is performed by writing certain timing parameters into the RTC I2C registers. This can be done by the program running on the main CPU, or by the ULP coprocessor itself.

Note:

The timing parameters are configured in cycles of RTC_FAST_CLK running at 17.5 MHz.

1. Set the low and high SCL half-periods by configuring `RTC_I2C_SCL_LOW_PERIOD_REG` and `RTC_I2C_SCL_HIGH_PERIOD_REG` in RTC_FAST_CLK cycles (e.g. `RTC_I2C_SCL_LOW_PERIOD_REG = 40`, `RTC_I2C_SCL_HIGH_PERIOD_REG = 40` for 100 kHz frequency).
2. Set the number of cycles between the SDA switch and the falling edge of SCL by using `RTC_I2C_SDA_DUTY_REG` in RTC_FAST_CLK (e.g. `RTC_I2C_SDA_DUTY_REG = 16`).
3. Set the waiting time after the START signal by using `RTC_I2C_SCL_START_PERIOD_REG` (e.g. `RTC_I2C_SCL_START_PERIOD = 30`).
4. Set the waiting time before the END signal by using `RTC_I2C_SCL_STOP_PERIOD_REG` (e.g. `RTC_I2C_SCL_STOP_PERIOD = 44`).
5. Set the transaction timeout by using `RTC_I2C_TIME_OUT_REG` (e.g. `RTC_I2C_TIME_OUT_REG = 200`).
6. Configure the RTC I2C controller into master mode by setting the bit `RTC_I2C_MS_MODE` in `RTC_I2C_CTRL_REG`.
7. Write the address(es) of external slave(s) to `SENS_I2C_SLAVE_ADDRn` (n : 0-7). Up to eight slave addresses can be pre-programmed this way. One of these addresses can then be selected for each transaction as part of the RTC I2C instruction.

Once RTC I2C is configured, the main CPU or the ULP coprocessor can communicate with the external I2C devices.

1.7.3 Using RTC I2C

1.7.3.1 Instruction Format

The format of RTC I2C instruction is consistent with that of I2C0/I2C1, see Section I2C CMD Controller in Chapter 25 *I2C Controller (I2C)*. The only difference is that RTC I2C provides fixed instructions for different operations, as follows:

- Command 0 ~ Command 1: specifically for I2C write operation
- Command 2 ~ Command 6: specifically for I2C read operation

Note: All slave addresses are expressed in 7 bits.

1.7.3.2 I2C_RD - I2C Read Workflow

Preparation for RTC I2C read:

- Configure the instruction list of RTC I2C (see Section CMD_Controller in Chapter 25 I2C Controller (I2C)), including instruction order, instruction code, read data number (byte_num), and other information.
- Configure the slave register address by setting the register SENS_SAR_I2C_CTRL[18:11].
- Start RTC I2C transmission by setting SENS_SAR_I2C_START_FORCE and SENS_SAR_I2C_START.
- When an RTC_I2C_RX_DATA_INT interrupt is received, transfer the read data stored in RTC_I2C_RDATA to SRAM RTC slow memory, or use the data directly.

The I2C_RD instruction performs the following operations (see Figure 1-31):

1. Master generates a START signal.
2. Master sends slave address, with r/w bit set to 0 (“write”). Slave address is obtained from SENS_I2C_SLAVE_ADDR_n.
3. Slave generates ACK.
4. Master sends slave register address.
5. Slave generates ACK.
6. Master generates a repeated START (RSTART) signal.
7. Master sends slave address, with r/w bit set to 1 (“read”).
8. Slave sends one byte of data.
9. Master checks whether the number of transmitted bytes reaches the number set by the current instruction (byte_num). If yes, master jumps out of the read instruction and sends an NACK signal. Otherwise master repeats Step 8 and waits for the slave to send the next byte.
10. Master generates a STOP signal and stops reading.

Figure 1-31. I2C Read Operation

Note:

The RTC I2C peripheral samples the SDA signals on the falling edge of SCL. If the slave changes SDA in less than 0.38 ms, the master may receive incorrect data.

1.7.3.3 I2C_WR - I2C Write Workflow

Preparation for RTC I2C write:

- Configure RTC I2C instruction list, including instruction order, instruction code, and the data to be written in byte (byte_num). See the configuration of I2C0/I2C1 in Section CMD_Controller in Chapter 25 I2C Controller (I2C).

- Configure the slave register address by setting the register `SENS_SAR_I2C_CTRL[18:11]`, and the data to be transmitted in `SENS_SAR_I2C_CTRL[26:19]`.
- Set `SENS_SAR_I2C_START_FORCE` and `SENS_SAR_I2C_START` to start the transmission.
- Update the next data to be transmitted in `SENS_SAR_I2C_CTRL[26:19]`, each time when an `RTC_I2C_TX_DATA_INT` interrupt is received.

The `I2C_WR` instruction performs the following operations, see Figure 1-32.

1. Master generates a START signal.
2. Master sends slave address, with r/w bit set to 0 (“write”). Slave address is obtained from `SENS_I2C_SLAVE_ADDR n` .
3. Slave generates ACK.
4. Master sends slave register address.
5. Slave generates ACK.
6. Master generates a repeated START (RSTART) signal.
7. Master sends slave address, with r/w bit set to 0 (“write”).
8. Master sends one byte of data.
9. Slave generates ACK. Master checks whether the number of transmitted bytes reaches the number set by the current instruction (`byte_num`). If yes, master jumps out of the write instruction and starts the next instruction. Otherwise the master repeats Step 8 and sends the next byte.
10. Master generates a STOP signal and stops the transmission.

Figure 1-32. I2C Write Operation

1.7.3.4 Detecting Error Conditions

Applications can query specific bits in the `RTC_I2C_INT_ST_REG` register to check if the transaction is successful. To enable checking for specific communication events, their corresponding bits should be set in register `RTC_I2C_INT_ENA_REG`. **Note that the bit map is shifted by 1.** If a specific communication event is detected and its corresponding bit in register `RTC_I2C_INT_ST_REG` is set, the event can then be cleared using register `RTC_I2C_INT_CLR_REG`.

1.7.4 RTC I2C Interrupts

- `RTC_I2C_SLAVE_TRAN_COMP_INT`: Triggered when the slave finishes the transaction.
- `RTC_I2C_ARBITRATION_LOST_INT`: Triggered when the master loses control of the bus.
- `RTC_I2C_MASTER_TRAN_COMP_INT`: Triggered when the master completes the transaction.
- `RTC_I2C_TRANS_COMPLETE_INT`: Triggered when a STOP signal is detected.

- RTC_I2C_TIME_OUT_INT: Triggered by time out event.
- RTC_I2C_ACK_ERR_INT: Triggered by ACK error.
- RTC_I2C_RX_DATA_INT: Triggered when data is received.
- RTC_I2C_TX_DATA_INT: Triggered when data is transmitted.
- RTC_I2C_DETECT_START_INT: Triggered when a START signal is detected.

1.8 Address Mapping

Table 1-12 shows the address mapping and available base registers for the peripherals accessible by ULP coprocessors.

Table 1-12. Address Mapping

Peripheral(s)	Base Register	Main Bus Address	ULP-FSM Base	ULP-RISC-V Base
RTC Control	DR_REG_RTCCNTL_BASE	0x60008000	0x8000	0x8000
RTC GPIO	DR_REG_RTC_IO_BASE	0x60008400	0x8400	0xA400
ADC, Touch, TSENS	DR_REG_SENS_BASE	0x60008800	0x8800	0xC800
RTC I2C	DR_REG_RTC_I2C_BASE	0x60008C00	0x8C00	0xEC00

To find more information about registers for these peripherals, please check the following chapters.

Table 1-13. Description of Registers for Peripherals Accessible by ULP Coprocessors

Registers Available for Peripherals	Described in Which Chapter
Registers for RTC Control	Chapter 5 <i>Low-Power Management (RTC_CNTL)</i> [to be added later]
Registers for RTC GPIO	Chapter 5 <i>IO MUX and GPIO Matrix (GPIO, IO MUX)</i>
Registers for ARC, Touch, TSENS	Chapter 4 <i>On-Chip Sensors and Analog Signal Processing</i> [to be added later]
Registers for RTC I2C	Section 1.9 <i>Register Summary</i> in this chapter

1.9 Register Summary

The following registers are used in ULP coprocessor:

- ULP (ALWAYS_ON) registers: not reset due to power down of RTC_PERI domain. See Chapter 5 *Low-Power Management (RTC_CNTL)* [to be added later].
- ULP (RTC_PERI) registers: reset due to power down of RTC_PERI domain. See Chapter 5 *Low-Power Management (RTC_CNTL)* [to be added later].
- RTC I2C registers: I2C related registers, including RTC I2C (RTC_PERI) and RTC I2C (I2C) registers.

1.9.1 ULP (ALWAYS_ON) Register Summary

The addresses in this section are relative to low-power management base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
ULP Timer Registers			
RTC_CNTL_ULP_CP_TIMER_REG	Configure the timer	0x00FC	varies
RTC_CNTL_ULP_CP_TIMER_1_REG	Configure sleep cycle of the timer	0x0134	R/W
ULP-FSM Register			
RTC_CNTL_ULP_CP_CTRL_REG	ULP-FSM configuration register	0x0100	R/W
ULP-RISC-V Register			
RTC_CNTL_COCPU_CTRL_REG	ULP-RISC-V configuration register	0x0104	varies

1.9.2 ULP (RTC_PERI) Register Summary

The addresses in this section are relative to low-power management base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
ULP-RISC-V Registers			
SENS_SAR_COCPU_INT_RAW_REG	Interrupt raw bit of ULP-RISC-V	0x00E8	RO
SENS_SAR_COCPU_INT_ENA_REG	Interrupt enable bit of ULP-RISC-V	0x00EC	R/W
SENS_SAR_COCPU_INT_ST_REG	Interrupt status bit of ULP-RISC-V	0x00F0	RO
SENS_SAR_COCPU_INT_CLR_REG	Interrupt clear bit of ULP-RISC-V	0x00F4	WO

1.9.3 RTC I2C (RTC_PERI) Register Summary

The addresses in this section are relative to low-power management base address + 0x0800 provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
RTC I2C Controller Register			
SENS_SAR_I2C_CTRL_REG	Configure RTC I2C transmission	0x0058	R/W
RTC I2C Slave Address Registers			
SENS_SAR_SLAVE_ADDR1_REG	Configure slave addresses 0-1 of RTC I2C	0x0040	R/W
SENS_SAR_SLAVE_ADDR2_REG	Configure slave addresses 2-3 of RTC I2C	0x0044	R/W
SENS_SAR_SLAVE_ADDR3_REG	Configure slave addresses 4-5 of RTC I2C	0x0048	R/W
SENS_SAR_SLAVE_ADDR4_REG	Configure slave addresses 6-7 of RTC I2C	0x004C	R/W

1.9.4 RTC I2C (I2C) Register Summary

The addresses in this section are relative to low-power management base address + 0x0C00 provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
RTC I2C Signal Setting Registers			
RTC_I2C_SCL_LOW_REG	Configure the low level width of SCL	0x0000	R/W
RTC_I2C_SCL_HIGH_REG	Configure the high level width of SCL	0x0014	R/W
RTC_I2C_SDA_DUTY_REG	Configure the SDA hold time after a negative SCL edge	0x0018	R/W

Name	Description	Address	Access
RTC_I2C_SCL_START_PERIOD_REG	Configure the delay between the SDA and SCL negative edge for a start condition	0x001C	R/W
RTC_I2C_SCL_STOP_PERIOD_REG	Configure the delay between SDA and SCL positive edge for a stop condition	0x0020	R/W
RTC I2C Control Registers			
RTC_I2C_CTRL_REG	Transmission setting	0x0004	R/W
RTC_I2C_STATUS_REG	RTC I2C status	0x0008	RO
RTC_I2C_TO_REG	Configure RTC I2C timeout	0x000C	R/W
RTC_I2C_SLAVE_ADDR_REG	Configure slave address	0x0010	R/W
RTC I2C Interrupt Registers			
RTC_I2C_INT_CLR_REG	Clear RTC I2C interrupt	0x0024	WO
RTC_I2C_INT_RAW_REG	RTC I2C raw interrupt	0x0028	RO
RTC_I2C_INT_ST_REG	RTC I2C interrupt status	0x002C	RO
RTC_I2C_INT_ENA_REG	Enable RTC I2C interrupt	0x0030	R/W
RTC I2C Status Register

1.10 Registers

1.10.1 ULP (ALWAYS_ON) Registers

The addresses in this section are relative to low-power management base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 1.1. RTC_CNTL_ULP_CP_TIMER_REG (0x00FC)

RTC_CNTL_ULP_CP_PC_INIT ULP coprocessor PC initial address. (R/W)

RTC_CNTL_ULP_CP_GPIO_WAKEUP_ENA Enable the option of ULP timer woken up by RTC GPIO. (R/W)

RTC_CNTL_ULP_CP_GPIO_WAKEUP_CLR Disable the option of ULP timer woken up by RTC GPIO. (WO)

RTC_CNTL_ULP_CP_SLP_TIMER_EN ULP coprocessor timer enable bit. 0: Disable hardware timer; 1: Enable hardware timer. (R/W)

Register 1.2. RTC_CNTL_ULP_CP_TIMER_1_REG (0x0134)

RTC_CNTL_ULP_CP_TIMER_SLP_CYCLE Set sleep cycles for ULP coprocessor timer. (R/W)

Register 1.3. RTC_CNTL_ULP_CP_CTRL_REG (0x0100)

RTC_CNTL_ULP_CP_CLK_FO ULP-FSM clock force on. (R/W)

RTC_CNTL_ULP_CP_RESET ULP-FSM clock software reset. (R/W)

RTC_CNTL_ULP_CP_FORCE_START_TOP Write 1 to start ULP-FSM by software. (R/W)

RTC_CNTL_ULP_CP_START_TOP Write 1 to start ULP-FSM. (R/W)

Register 1.4. RTC_CNTL_COCPU_CTRL_REG (0x0104)

(reserved)				RTC_CNTL_COCPU_CLKGATE_EN				RTC_CNTL_COCPU_SW_INT_TRIGGER				RTC_CNTL_COCPU_SHUT_RESET_EN				RTC_CNTL_COCPU_SHUT_2_CLK_DIS				RTC_CNTL_COCPU_SHUT				RTC_CNTL_COCPU_START_2_INTR_EN				RTC_CNTL_COCPU_START_2_RESET_DIS				RTC_CNTL_COCPU_CLK_FO			
31	28	27	26	25	24	23	22	21					14	13	12					7	6					1	0								
0	0	0	0	0	0	0	0	1	0				40		0				16						8		0								

RTC_CNTL_COCPU_CLK_FO ULP-RISC-V clock force on. (R/W)

RTC_CNTL_COCPU_START_2_RESET_DIS Time from ULP-RISC-V startup to pull down reset. (R/W)

RTC_CNTL_COCPU_START_2_INTR_EN Time from ULP-RISC-V startup to send out RISC_V_START_INT interrupt. (R/W)

RTC_CNTL_COCPU_SHUT Shut down ULP-RISC-V. (R/W)

RTC_CNTL_COCPU_SHUT_2_CLK_DIS Time from shut down ULP-RISC-V to disable clock. (R/W)

RTC_CNTL_COCPU_SHUT_RESET_EN This bit is used to reset ULP-RISC-V. (R/W)

RTC_CNTL_COCPU_SEL 0: select ULP-RISC-V; 1: select ULP-FSM. (R/W)

RTC_CNTL_COCPU_DONE_FORCE 0: select ULP-FSM DONE signal; 1: select ULP-RISC-V DONE signal. (R/W)

RTC_CNTL_COCPU_DONE DONE signal. Write 1 to this bit, ULP-RISC-V will go to HALT and the timer starts counting. (R/W)

RTC_CNTL_COCPU_SW_INT_TRIGGER Trigger ULP-RISC-V register interrupt. (WO)

RTC_CNTL_COCPU_CLKGATE_EN Enable ULP-RISC-V clock gate. (WO)

1.10.2 ULP (RTC_PERI) Registers

The addresses in this section are relative to low-power management base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 1.6. SENS_SAR_COCPU_INT_ENA_REG (0x00EC)

(reserved)												SENS_COCPU_TOUCH_SCAN_DONE_INT_ENA SENS_COCPU_TOUCH_APPROACH_LOOP_DONE_INT_ENA SENS_COCPU_TOUCH_INACTIVE_INT_ENA SENS_COCPU_TOUCH_ACTIVE_INT_ENA SENS_COCPU_SARADC2_DONE_INT_ENA SENS_COCPU_SARADC1_DONE_INT_ENA SENS_COCPU_TSENS_DONE_INT_ENA SENS_COCPU_START_INT_ENA SENS_COCPU_SW_INT_ENA SENS_COCPU_SWD_INT_ENA SENS_COCPU_TOUCH_TIMEOUT_INT_ENA												
31											12	11	10	9	8	7	6	5	4	3	2	1	0	Reset
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

- SENS_COCPU_TOUCH_DONE_INT_ENA** [TOUCH_DONE_INT](#) interrupt enable bit. (R/W)
- SENS_COCPU_TOUCH_INACTIVE_INT_ENA** [TOUCH_INACTIVE_INT](#) interrupt enable bit. (R/W)
- SENS_COCPU_TOUCH_ACTIVE_INT_ENA** [TOUCH_ACTIVE_INT](#) interrupt enable bit. (R/W)
- SENS_COCPU_SARADC1_INT_ENA** [SARADC1_DONE_INT](#) interrupt enable bit. (R/W)
- SENS_COCPU_SARADC2_INT_ENA** [SARADC2_DONE_INT](#) interrupt enable bit. (R/W)
- SENS_COCPU_TSENS_INT_ENA** [TSENS_DONE_INT](#) interrupt enable bit. (R/W)
- SENS_COCPU_START_INT_ENA** [RISCV_START_INT](#) interrupt enable bit. (R/W)
- SENS_COCPU_SW_INT_ENA** [SW_INT](#) interrupt enable bit. (R/W)
- SENS_COCPU_SWD_INT_ENA** [SWD_INT](#) interrupt enable bit. (R/W)
- SENS_COCPU_TOUCH_TIMEOUT_INT_ENA** [TOUCH_TIME_OUT](#) interrupt enable bit. (R/W)
- SENS_COCPU_TOUCH_APPROACH_LOOP_DONE_INT_ENA** [TOUCH_APPROACH_LOOP_DONE_INT](#) interrupt enable bit. (R/W)
- SENS_COCPU_TOUCH_SCAN_DONE_INT_ENA** [TOUCH_SCAN_DONE_INT](#) interrupt enable bit. (R/W)

Register 1.7. SENS_SAR_COCPU_INT_ST_REG (0x00F0)

(reserved)																																											
												31	12	11	10	9	8	7	6	5	4	3	2	1	0	Reset																	
												0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

SENS_COCPU_TOUCH_DONE_INT_ST TOUCH_DONE_INT interrupt status bit. (RO)

SENS_COCPU_TOUCH_INACTIVE_INT_ST TOUCH_INACTIVE_INT interrupt status bit. (RO)

SENS_COCPU_TOUCH_ACTIVE_INT_ST TOUCH_ACTIVE_INT interrupt status bit. (RO)

SENS_COCPU_SARADC1_INT_ST SARADC1_DONE_INT interrupt status bit. (RO)

SENS_COCPU_SARADC2_INT_ST SARADC2_DONE_INT interrupt status bit. (RO)

SENS_COCPU_TSSENS_INT_ST TSSENS_DONE_INT interrupt status bit. (RO)

SENS_COCPU_START_INT_ST RISCV_START_INT interrupt status bit. (RO)

SENS_COCPU_SW_INT_ST SW_INT interrupt status bit. (RO)

SENS_COCPU_SWD_INT_ST SWD_INT interrupt status bit. (RO)

SENS_COCPU_TOUCH_TIMEOUT_INT_ST TOUCH_TIME_OUT interrupt status bit. (RO)

SENS_COCPU_TOUCH_APPROACH_LOOP_DONE_INT_ST TOUCH_APPROACH_LOOP_DONE_INT
interrupt status bit. (RO)

SENS_COCPU_TOUCH_SCAN_DONE_INT_ST TOUCH_SCAN_DONE_INT interrupt status bit.
(RO)

Register 1.8. SENS_SAR_COCPU_INT_CLR_REG (0x00F4)

(reserved)												<i>SENS_COCPU_TOUCH_SCAN_DONE_INT_CLR</i> <i>SENS_COCPU_TOUCH_APPROACH_LOOP_DONE_INT_CLR</i> <i>SENS_COCPU_TOUCH_INACTIVE_INT_CLR</i> <i>SENS_COCPU_TOUCH_ACTIVE_INT_CLR</i> <i>SENS_COCPU_SARADC1_DONE_INT_CLR</i> <i>SENS_COCPU_SARADC2_DONE_INT_CLR</i> <i>SENS_COCPU_TSENS_DONE_INT_CLR</i> <i>SENS_COCPU_START_INT_CLR</i> <i>SENS_COCPU_SW_INT_CLR</i> <i>SENS_COCPU_SWD_INT_CLR</i> <i>SENS_COCPU_TOUCH_TIMEOUT_INT_CLR</i>																
31											12	11	10	9	8	7	6	5	4	3	2	1	0	Reset				
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

SENS_COCPU_TOUCH_DONE_INT_CLR **TOUCH_DONE_INT** interrupt clear bit. (WO)

SENS_COCPU_TOUCH_INACTIVE_INT_CLR **TOUCH_INACTIVE_INT** interrupt clear bit. (WO)

SENS_COCPU_TOUCH_ACTIVE_INT_CLR **TOUCH_ACTIVE_INT** interrupt clear bit. (WO)

SENS_COCPU_SARADC1_DONE_INT_CLR **SARADC1_DONE_INT** interrupt clear bit. (WO)

SENS_COCPU_SARADC2_DONE_INT_CLR **SARADC2_DONE_INT** interrupt clear bit. (WO)

SENS_COCPU_TSENS_DONE_INT_CLR **TSENS_DONE_INT** interrupt clear bit. (WO)

SENS_COCPU_START_INT_CLR **RISCV_START_INT** interrupt clear bit. (WO)

SENS_COCPU_SW_INT_CLR **SW_INT** interrupt clear bit. (WO)

SENS_COCPU_SWD_INT_CLR **SWD_INT** interrupt clear bit. (WO)

SENS_COCPU_TOUCH_TIMEOUT_INT_CLR **TOUCH_TIMEOUT_INT** interrupt clear bit. (WO)

SENS_COCPU_TOUCH_APPROACH_LOOP_DONE_INT_CLR **TOUCH_APPROACH_LOOP_DONE_INT** interrupt clear bit. (WO)

SENS_COCPU_TOUCH_SCAN_DONE_INT_CLR **TOUCH_SCAN_DONE_INT** interrupt clear bit. (WO)

1.10.3 RTC I2C (RTC_PERI) Registers

The addresses in this section are relative to low-power management base address + 0x0800 provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 1.9. SENS_SAR_I2C_CTRL_REG (0x0058)

(reserved)					SENS_SAR_I2C_START_FORCE					SENS_SAR_I2C_CTRL				
31	30	29	28	27										
0	0	0	0		0									

Reset

SENS_SAR_I2C_CTRL RTC I2C control data; active only when [SENS_SAR_I2C_START_FORCE](#) = 1. (R/W)

SENS_SAR_I2C_START Start RTC I2C; active only when [SENS_SAR_I2C_START_FORCE](#) = 1. (R/W)

SENS_SAR_I2C_START_FORCE 0: RTC I2C started by FSM; 1: RTC I2C started by software. (R/W)

Register 1.10. SENS_SAR_SLAVE_ADDR1_REG (0x0040)

(reserved)										SENS_I2C_SLAVE_ADDR0										SENS_I2C_SLAVE_ADDR1														
31											22	21											11	10										
0	0	0	0	0	0	0	0	0	0	0	0x0										0x0													

Reset

SENS_I2C_SLAVE_ADDR1 RTC I2C slave address 1. (R/W)

SENS_I2C_SLAVE_ADDR0 RTC I2C slave address 0. (R/W)

Register 1.11. SENS_SAR_SLAVE_ADDR2_REG (0x0044)

(reserved)										SENS_I2C_SLAVE_ADDR2										SENS_I2C_SLAVE_ADDR3														
31											22	21											11	10										
0	0	0	0	0	0	0	0	0	0	0	0x0										0x0													

Reset

SENS_I2C_SLAVE_ADDR3 RTC I2C slave address 3. (R/W)

SENS_I2C_SLAVE_ADDR2 RTC I2C slave address 2. (R/W)

Register 1.12. SENS_SAR_SLAVE_ADDR3_REG (0x0048)

(reserved)										SENS_I2C_SLAVE_ADDR4											SENS_I2C_SLAVE_ADDR5																
31											22	21												11	10												0
0 0 0 0 0 0 0 0 0 0										0x0											0x0											Reset					

SENS_I2C_SLAVE_ADDR5 RTC I2C slave address 5. (R/W)

SENS_I2C_SLAVE_ADDR4 RTC I2C slave address 4. (R/W)

Register 1.13. SENS_SAR_SLAVE_ADDR4_REG (0x004C)

(reserved)										SENS_I2C_SLAVE_ADDR6											SENS_I2C_SLAVE_ADDR7																
31											22	21												11	10												0
0 0 0 0 0 0 0 0 0 0										0x0											0x0											Reset					

SENS_I2C_SLAVE_ADDR7 RTC I2C slave address 7. (R/W)

SENS_I2C_SLAVE_ADDR6 RTC I2C slave address 6. (R/W)

1.10.4 RTC I2C (I2C) Registers

The addresses in this section are relative to low-power management base address + 0x0C00 provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 1.14. RTC_I2C_SCL_LOW_REG (0x0000)

(reserved)										RTC_I2C_SCL_LOW_PERIOD														
31											20	19												0
0 0 0 0 0 0 0 0 0 0										0x100											Reset			

RTC_I2C_SCL_LOW_PERIOD This register is used to configure how many clock cycles SCL remains low. (R/W)

Register 1.15. RTC_I2C_SCL_HIGH_REG (0x0014)

RTC_I2C_SCL_HIGH_PERIOD This register is used to configure how many cycles SCL remains high. (R/W)

Register 1.16. RTC_I2C_SDA_DUTY_REG (0x0018)

RTC_I2C_SDA_DUTY_NUM The number of clock cycles between the SDA switch and the falling edge of SCL. (R/W)

Register 1.17. RTC_I2C_SCL_START_PERIOD_REG (0x001C)

RTC_I2C_SCL_START_PERIOD Number of clock cycles to wait after generating a start condition. (R/W)

Register 1.18. RTC_I2C_SCL_STOP_PERIOD_REG (0x0020)

31	(reserved)	20	19	<i>RTC_I2C_SCL_STOP_PERIOD</i>							0
0 0 0 0 0 0 0 0 0 0 0 0 0 0				8							Reset

RTC_I2C_SCL_STOP_PERIOD Number of clock cycles to wait before generating a stop condition. (R/W)

Register 1.19. RTC_I2C_CTRL_REG (0x0004)

31	30	29	28	(reserved)												6	5	4	3	2	1	0	Reset			
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

RTC_I2C_SDA_FORCE_OUT SDA output mode. 0: open drain; 1: push pull. (R/W)

RTC_I2C_SCL_FORCE_OUT SCL output mode. 0: open drain; 1: push pull. (R/W)

RTC_I2C_MS_MODE Set this bit to configure RTC I2C as a master. (R/W)

RTC_I2C_TRANS_START Set this bit to 1, RTC I2C starts sending data. (R/W)

RTC_I2C_TX_LSB_FIRST This bit is used to control the sending mode. 0: send data from the most significant bit; 1: send data from the least significant bit. (R/W)

RTC_I2C_RX_LSB_FIRST This bit is used to control the storage mode for received data. 0: receive data from the most significant bit; 1: receive data from the least significant bit. (R/W)

RTC_I2C_CTRL_CLK_GATE_EN RTC I2C controller clock gate. (R/W)

RTC_I2C_RESET RTC I2C software reset. (R/W)

Register 1.20. RTC_I2C_STATUS_REG (0x0008)

- RTC_I2C_ACK_REC** The received ACK value. 0: ACK; 1: NACK. (RO)
- RTC_I2C_SLAVE_RW** 0: master writes to slave; 1: master reads from slave. (RO)
- RTC_I2C_ARB_LOST** When the RTC I2C loses control of SCL line, the register changes to 1. (RO)
- RTC_I2C_BUS_BUSY** 0: RTC I2C bus is in idle state; 1: RTC I2C bus is busy transferring data. (RO)
- RTC_I2C_SLAVE_ADDRESSED** When the address sent by the master matches the address of the slave, then this bit will be set. (RO)
- RTC_I2C_BYTE_TRANS** This field changes to 1 when one byte is transferred. (RO)
- RTC_I2C_OP_CNT** Indicate which operation is working. (RO)

Register 1.21. RTC_I2C_TIMEOUT_REG (0x000C)

RTC_I2C_TIMEOUT Timeout threshold. (R/W)

Register 1.22. RTC_I2C_SLAVE_ADDR_REG (0x0010)

RTC_I2C_ADDR_10BIT_EN This field is used to enable the slave 10-bit addressing mode. (R/W)

Register 1.23. RTC_I2C_INT_CLR_REG (0x0024)

RTC_I2C_SLAVE_TRAN_COMP_INT_CLR [RTC_I2C_SLAVE_TRAN_COMP_INT](#) interrupt clear bit. (WO)

RTC_I2C_ARBITRATION_LOST_INT_CLR [RTC_I2C_ARBITRATION_LOST_INT](#) interrupt clear bit. (WO)

RTC_I2C_MASTER_TRAN_COMP_INT_CLR [RTC_I2C_MASTER_TRAN_COMP_INT](#) interrupt clear bit. (WO)

RTC_I2C_TRANS_COMPLETE_INT_CLR [RTC_I2C_TRANS_COMPLETE_INT](#) interrupt clear bit. (WO)

RTC_I2C_TIMEOUT_INT_CLR [RTC_I2C_TIMEOUT_INT](#) interrupt clear bit. (WO)

RTC_I2C_ACK_ERR_INT_CLR [RTC_I2C_ACK_ERR_INT](#) interrupt clear bit. (WO)

RTC_I2C_RX_DATA_INT_CLR [RTC_I2C_RX_DATA_INT](#) interrupt clear bit. (WO)

RTC_I2C_TX_DATA_INT_CLR [RTC_I2C_TX_DATA_INT](#) interrupt clear bit. (WO)

RTC_I2C_DETECT_START_INT_CLR [RTC_I2C_DETECT_START_INT](#) interrupt clear bit. (WO)

Register 1.24. RTC_I2C_INT_RAW_REG (0x0028)

RTC_I2C_SLAVE_TRAN_COMP_INT_RAW [RTC_I2C_SLAVE_TRAN_COMP_INT](#) interrupt raw bit. (RO)

RTC_I2C_ARBITRATION_LOST_INT_RAW [RTC_I2C_ARBITRATION_LOST_INT](#) interrupt raw bit. (RO)

RTC_I2C_MASTER_TRAN_COMP_INT_RAW [RTC_I2C_MASTER_TRAN_COMP_INT](#) interrupt raw bit. (RO)

RTC_I2C_TRANS_COMPLETE_INT_RAW [RTC_I2C_TRANS_COMPLETE_INT](#) interrupt raw bit. (RO)

RTC_I2C_TIMEOUT_INT_RAW [RTC_I2C_TIMEOUT_INT](#) interrupt raw bit. (RO)

RTC_I2C_ACK_ERR_INT_RAW [RTC_I2C_ACK_ERR_INT](#) interrupt raw bit. (RO)

RTC_I2C_RX_DATA_INT_RAW [RTC_I2C_RX_DATA_INT](#) interrupt raw bit. (RO)

RTC_I2C_TX_DATA_INT_RAW [RTC_I2C_TX_DATA_INT](#) interrupt raw bit. (RO)

RTC_I2C_DETECT_START_INT_RAW [RTC_I2C_DETECT_START_INT](#) interrupt raw bit. (RO)

Register 1.25. RTC_I2C_INT_ST_REG (0x002C)

- RTC_I2C_SLAVE_TRAN_COMP_INT_ST [RTC_I2C_SLAVE_TRAN_COMP_INT](#) interrupt status bit. (RO)
- RTC_I2C_ARBITRATION_LOST_INT_ST [RTC_I2C_ARBITRATION_LOST_INT](#) interrupt status bit. (RO)
- RTC_I2C_MASTER_TRAN_COMP_INT_ST [RTC_I2C_MASTER_TRAN_COMP_INT](#) interrupt status bit. (RO)
- RTC_I2C_TRANS_COMPLETE_INT_ST [RTC_I2C_TRANS_COMPLETE_INT](#) interrupt status bit. (RO)
- RTC_I2C_TIMEOUT_INT_ST [RTC_I2C_TIMEOUT_INT](#) interrupt status bit. (RO)
- RTC_I2C_ACK_ERR_INT_ST [RTC_I2C_ACK_ERR_INT](#) interrupt status bit. (RO)
- RTC_I2C_RX_DATA_INT_ST [RTC_I2C_RX_DATA_INT](#) interrupt status bit. (RO)
- RTC_I2C_TX_DATA_INT_ST [RTC_I2C_TX_DATA_INT](#) interrupt status bit. (RO)
- RTC_I2C_DETECT_START_INT_ST [RTC_I2C_DETECT_START_INT](#) interrupt status bit. (RO)

Register 1.26. RTC_I2C_INT_ENA_REG (0x0030)

RTC_I2C_SLAVE_TRAN_COMP_INT_ENA [RTC_I2C_SLAVE_TRAN_COMP_INT](#) interrupt enable bit. (R/W)

RTC_I2C_ARBITRATION_LOST_INT_ENA [RTC_I2C_ARBITRATION_LOST_INT](#) interrupt enable bit. (R/W)

RTC_I2C_MASTER_TRAN_COMP_INT_ENA [RTC_I2C_MASTER_TRAN_COMP_INT](#) interrupt enable bit. (R/W)

RTC_I2C_TRANS_COMPLETE_INT_ENA [RTC_I2C_TRANS_COMPLETE_INT](#) interrupt enable bit. (R/W)

RTC_I2C_TIMEOUT_INT_ENA [RTC_I2C_TIMEOUT_INT](#) interrupt enable bit. (R/W)

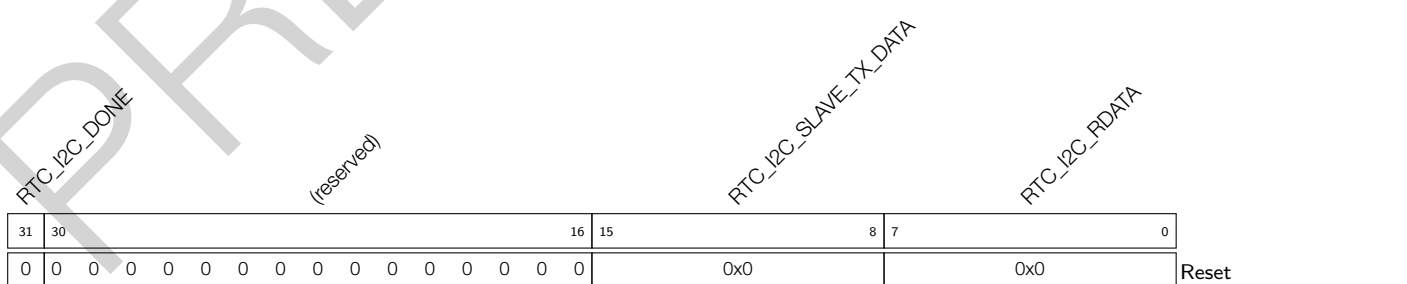

RTC_I2C_ACK_ERR_INT_ENA [RTC_I2C_ACK_ERR_INT](#) interrupt enable bit. (R/W)

RTC_I2C_RX_DATA_INT_ENA [RTC_I2C_RX_DATA_INT](#) interrupt enable bit. (R/W)

RTC_I2C_TX_DATA_INT_ENA [RTC_I2C_TX_DATA_INT](#) interrupt enable bit. (R/W)

RTC_I2C_DETECT_START_INT_ENA [RTC_I2C_DETECT_START_INT](#) interrupt enable bit. (R/W)

Register 1.27. RTC_I2C_DATA_REG (0x0034)

RTC_I2C_RDATA Data received. (RO)

RTC_I2C_SLAVE_TX_DATA The data sent by slave. (R/W)

RTC_I2C_DONE RTC I2C transmission is done. (RO)

Register 1.28. RTC_I2C_CMD0_REG (0x0038)

RTC_I2C_COMMAND0 Content of command 0. For more information, please refer to the register I2C_COMD0_REG in Chapter I2C Controller. (R/W)

RTC_I2C_COMMAND0_DONE When command 0 is done, this bit changes to 1. (RO)

Register 1.29. RTC_I2C_CMD1_REG (0x003C)

RTC_I2C_COMMAND1 Content of command 1. For more information, please refer to the register I2C_COMD1_REG in Chapter I2C Controller. (R/W)

RTC_I2C_COMMAND1_DONE When command 1 is done, this bit changes to 1. (RO)

Register 1.30. RTC_I2C_CMD2_REG (0x0040)

RTC_I2C_COMMAND2 Content of command 2. For more information, please refer to the register I2C_COMD2_REG in Chapter I2C Controller. (R/W)

RTC_I2C_COMMAND2_DONE When command 2 is done, this bit changes to 1. (RO)

Register 1.31. RTC_I2C_CMD3_REG (0x0044)

RTC_I2C_COMMAND3 Content of command 3. For more information, please refer to the register I2C_COMD3_REG in Chapter I2C Controller. (R/W)

RTC_I2C_COMMAND3_DONE When command 3 is done, this bit changes to 1. (RO)

Register 1.32. RTC_I2C_CMD4_REG (0x0048)

RTC_I2C_COMMAND4 Content of command 4. For more information, please refer to the register I2C_COMD4_REG in Chapter I2C Controller. (R/W)

RTC_I2C_COMMAND4_DONE When command 4 is done, this bit changes to 1. (RO)

Register 1.33. RTC_I2C_CMD5_REG (0x004C)

RTC_I2C_COMMAND5 Content of command 5. For more information, please refer to the register I2C_COMD5_REG in Chapter I2C Controller. (R/W)

RTC_I2C_COMMAND5_DONE When command 5 is done, this bit changes to 1. (RO)

Register 1.34. RTC_I2C_CMD6_REG (0x0050)

RTC_I2C_COMMAND6 Content of command 6. For more information, please refer to the register I2C_COMD6_REG in Chapter I2C Controller. (R/W)

RTC_I2C_COMMAND6_DONE When command 6 is done, this bit changes to 1. (RO)

Register 1.35. RTC_I2C_CMD7_REG (0x0054)

RTC_I2C_COMMAND7 Content of command 7. For more information, please refer to the register I2C_COMD7_REG in Chapter I2C Controller. (R/W)

RTC_I2C_COMMAND7_DONE When command 7 is done, this bit changes to 1. (RO)

Register 1.36. RTC_I2C_CMD8_REG (0x0058)

RTC_I2C_COMMAND8 Content of command 8. For more information, please refer to the register I2C_COMD8_REG in Chapter I2C Controller. (R/W)

RTC_I2C_COMMAND8_DONE When command 8 is done, this bit changes to 1. (RO)

2 GDMA Controller (GDMA)

2.1 Overview

General Direct Memory Access (GDMA) is a feature that allows peripheral-to-memory, memory-to-peripheral, and memory-to-memory data transfer at a high speed. The CPU is not involved in the GDMA transfer, and therefore it becomes more efficient with less workload.

The GDMA controller in ESP32-S3 has ten independent channels, i.e. five transmit channels and five receive channels. These ten channels are shared by peripherals with GDMA feature, namely SPI2, SPI3, UHCI0, I2S0, I2S1, LCD/CAM, AES, SHA, ADC, and RMT. You can assign the ten channels to any of these peripherals. Every channel supports access to internal RAM or external RAM.

The GDMA controller uses fixed-priority and round-robin channel arbitration schemes to manage peripherals' needs for bandwidth.

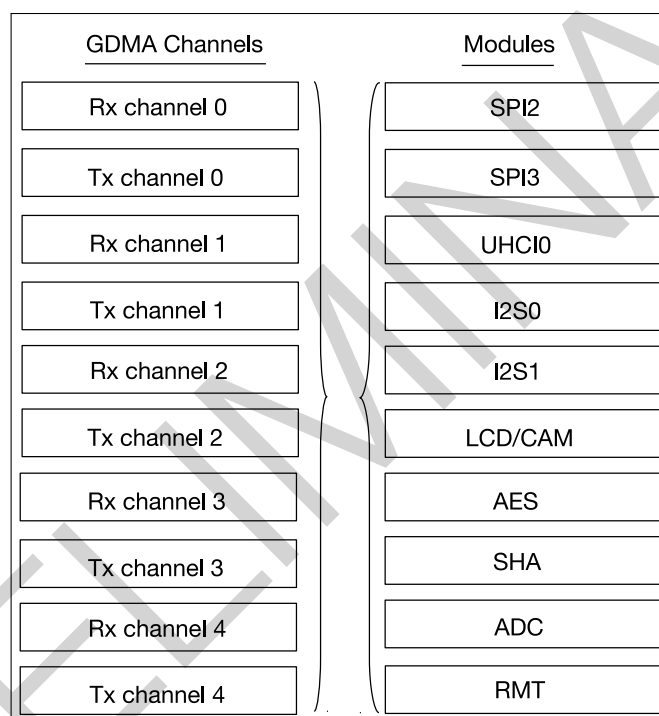

Figure 2-1. Modules with GDMA Feature and GDMA Channels

2.2 Features

The GDMA controller has the following features:

- AHB bus architecture
- Programmable length of data to be transferred in bytes
- Linked list of descriptors
- INCR burst transfer when accessing internal RAM
- Access to an address space of 480 KB at most in internal RAM
- Access to an address space of 32 MB at most in external RAM

- Five transmit channels and five receive channels
- Access to internal and external RAM supported by every channel
- Software-configurable selection of peripheral requesting its service supported by every channel
- Fixed channel priority and round-robin channel arbitration

2.3 Architecture

In ESP32-S3, all modules that need high-speed data transfer support GDMA. The GDMA controller and CPU data bus have access to the same address space in internal and external RAM. Figure 2-2 shows the basic architecture of the GDMA engine.

Figure 2-2. GDMA Engine Architecture

The GDMA controller has ten independent channels, i.e. five transmit channels and five receive channels. Every channel can be connected to different peripherals. In other words, channels are general-purpose, shared by peripherals.

The GDMA engine has two independent AHB bus referred to as AHB_BUS1 and AHB_BUS2 respectively. AHB_BUS1 is used to read data from or write data to internal RAM, whereas AHB_BUS2 is used to read data from or write data to external RAM. For available address range of RAM, please see Chapter 3 *System and Memory*.

Software can use the GDMA engine through linked lists. These linked lists, stored in internal RAM, consist of $outlink_n$ and $inlink_n$, where n indicates the channel number (ranging from 0 to 4). The GDMA controller reads an $outlink_n$ (i.e. a linked list of transmit descriptors) from internal RAM and transmits data in corresponding RAM according to the $outlink_n$, or reads an $inlink_n$ (i.e. a linked list of receive descriptors) and stores received data into specific address space in RAM according to the $inlink_n$.

2.4 Functional Description

2.4.1 Linked List

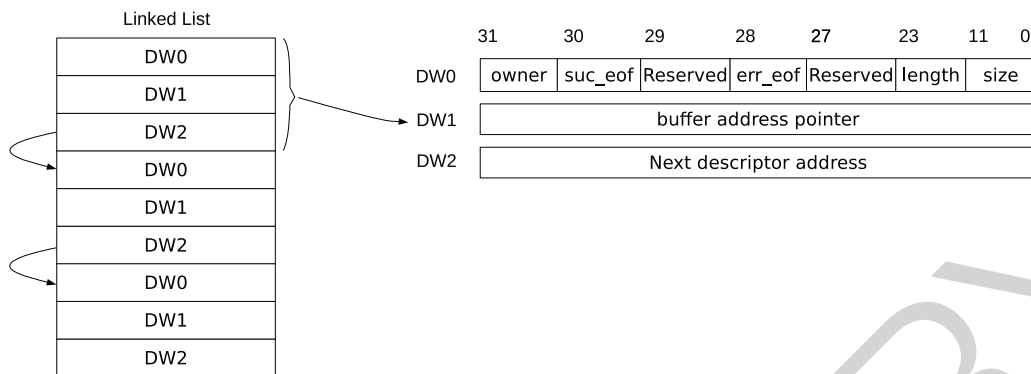

Figure 2-3. Structure of a Linked List

Figure 2-3 shows the structure of a linked list. An outlink and an inlink have the same structure. A linked list is formed by one or more descriptors, and each descriptor consists of three words. Linked lists should be in internal RAM for the GDMA engine to be able to use them. The meaning of each field is as follows:

- Owner (DW0) [31]: Specifies who is allowed to access the buffer that this descriptor points to.
 - 1'b0: CPU can access the buffer;
 - 1'b1: The GDMA controller can access the buffer.
 When the GDMA controller stops using the buffer, this bit in a transmit descriptor is automatically cleared by hardware, and this bit in a receive descriptor is automatically cleared by hardware only if `GDMA_OUT_AUTO_WBACK_CHn` is set to 1. When software loads a linked list, this bit should be set to 1.

Note: GDMA_OUT is the prefix of transmit channel registers, and GDMA_IN is the prefix of receive channel registers.
- suc_eof (DW0) [30]: Specifies whether this descriptor is the last descriptor in the list.
 - 1'b0: This descriptor is not the last one;
 - 1'b1: This descriptor is the last one.
 Software clears suc_eof bit in receive descriptors. When a frame or packet has been received, this bit in the last receive descriptor is set by hardware, and this bit in the last transmit descriptor is set by software.
- Reserved (DW0) [29]: Reserved. Value of this bit does not matter.
- err_eof (DW0) [28]: Specifies whether the received data have errors.

This bit is used only when UHCI0 uses GDMA to receive data. When an error is detected in the received frame or packet, this bit in the receive descriptor is set to 1 by hardware.
- Reserved (DW0) [27:24]: Reserved.
- Length (DW0) [23:12]: Specifies the number of valid bytes in the buffer that this descriptor points to. This field in a transmit descriptor is written by software and indicates how many bytes can be read from the buffer; this field in a receive descriptor is written by hardware automatically and indicates how many valid bytes have been stored into the buffer.
- Size (DW0) [11:0]: Specifies the size of the buffer that this descriptor points to.

- Buffer address pointer (DW1): Address of the buffer.
- Next descriptor address (DW2): Address of the next descriptor. If the current descriptor is the last one (suc_eof = 1), this value is 0. This field can only point to internal RAM.

If the length of data received is smaller than the size of the buffer, the GDMA controller will not use available space of the buffer in the next transaction.

2.4.2 Peripheral-to-Memory and Memory-to-Peripheral Data Transfer

The GDMA controller can transfer data from memory to peripheral (transmit) and from peripheral to memory (receive). A transmit channel transfers data in the specified memory location to a peripheral's transmitter via an outlink n , whereas a receive channel transfers data received by a peripheral to the specified memory location via an inlink n .

Every transmit and receive channel can be connected to any peripheral with GDMA feature. Table 2-1 illustrates how to select the peripheral to be connected via registers. When a channel is connected to a peripheral, the rest channels can not be connected to that peripheral. All transmit and receive channels support access to internal and external RAM. For details, please refer to Section 2.4.8 and Section 2.4.9.

Table 2-1. Selecting Peripherals via Register Configuration

GDMA_PERI_IN_SEL_CH n GDMA_PERI_OUT_SEL_CH n	Peripheral
0	SPI2
1	SPI3
2	UHCI0
3	I2S0
4	I2S1
5	LCD/CAM
6	AES
7	SHA
8	ADC
9	RMT

2.4.3 Memory-to-Memory Data Transfer

The GDMA controller also allows memory-to-memory data transfer. Such data transfer can be enabled by setting `GDMA_MEM_TRANS_EN_CH n` , which connects the output of transmit channel n to the input of receive channel n . Note that a transmit channel is only connected to the receive channel with the same number (n).

As every transmit and receive channel can be used to access internal and external RAM, there are four data transfer modes:

- from internal RAM to internal RAM
- from internal RAM to external RAM
- from external RAM to internal RAM
- from external RAM to external RAM

2.4.4 Channel Buffer

Every transmit and receive channel contains FIFOs at three levels, i.e. L1FIFO, L2FIFO, and L3FIFO. As Figure 2-4 shows, L1FIFO is close to the memory, L3FIFO is close to peripherals, and L2FIFO falls in between L1FIFO and L3FIFO. L1FIFO, L2FIFO and L3FIFO have fixed depth: 24, 128, and 16 bytes, respectively.

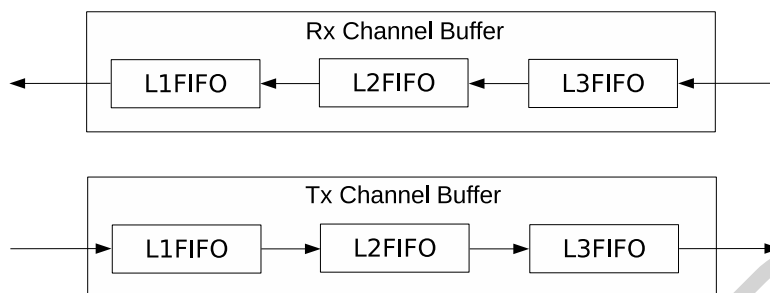

Figure 2-4. Channel Buffer

2.4.5 Enabling GDMA

Software uses the GDMA controller through linked lists. When the GDMA controller receives data, software loads an inlink, configures `GDMA_INLINK_ADDR_CHn` field with address of the first receive descriptor, and sets `GDMA_INLINK_START_CHn` bit to enable GDMA. When the GDMA controller transmits data, software loads an outlink, prepares data to be transmitted, configures `GDMA_OUTLINK_ADDR_CHn` field with address of the first transmit descriptor, and sets `GDMA_OUTLINK_START_CHn` bit to enable GDMA. `GDMA_INLINK_START_CHn` bit and `GDMA_OUTLINK_START_CHn` bit are cleared automatically by hardware.

In some cases, you may want to append more descriptors to a DMA transfer that is already started. Naively, it would seem to be possible to do this by clearing the EOF bit of the final descriptor in the existing list and setting its next descriptor address pointer field (DW2) to the first descriptor of the to-be-added list. However, this strategy fails if the existing DMA transfer is almost or entirely finished. Instead, the GDMA engine has specialized logic to make sure a DMA transfer can be continued or restarted: if it is still ongoing, it will make sure to take the appended descriptors into account; if the transfer has already finished, it will restart with the new descriptors. This is implemented in the Restart function.

When using the Restart function, software needs to rewrite the address of the first descriptor in the new list to DW2 of the last descriptor in the loaded list, and set `GDMA_INLINK_RESTART_CHn` bit or `GDMA_OUTLINK_RESTART_CHn` bit (these two bits are cleared automatically by hardware). As shown in Figure 2-5, by doing so hardware can obtain the address of the first descriptor in the new list when reading the last descriptor in the loaded list, and then read the new list.

Figure 2-5. Relationship among Linked Lists

2.4.6 Linked List Reading Process

Once configured and enabled by software, the GDMA controller starts to read the linked list from internal RAM. The GDMA performs checks on descriptors in the linked list. Only if the descriptors pass the checks, will the corresponding GDMA channel transfer data. If the descriptors fail any of the checks, hardware will trigger descriptor error interrupt (either `GDMA_IN_DSCR_ERR_CH n _INT` or `GDMA_OUT_DSCR_ERR_CH n _INT`), and the channel will halt.

The checks performed on descriptors are:

- Owner bit check when `GDMA_IN_CHECK_OWNER_CH n` or `GDMA_OUT_CHECK_OWNER_CH n` is set to 1. If the owner bit is 0, the buffer is accessed by the CPU. In this case, the owner bit fails the check. The owner bit will not be checked if `GDMA_IN_CHECK_OWNER_CH n` or `GDMA_OUT_CHECK_OWNER_CH n` is 0;
- Buffer address pointer (DW1) check. If the buffer address pointer points to `0x3FC88000 ~ 0x3FCFFFFF` or `0x3C000000 ~ 0x3DFFFFFF` (please refer to Section 2.4.8), it passes the check.

After software detects a descriptor error interrupt, it must reset the corresponding channel, and enable GDMA by setting `GDMA_OUTLINK_START_CH n` or `GDMA_INLINK_START_CH n` bit.

Note: The third word (DW2) in a descriptor can only point to a location in internal RAM, given that the third word points to the next descriptor to use and that all descriptors must be in internal memory.

2.4.7 EOF

The GDMA controller uses EOF (end of frame) flags to indicate the end of data frame or packet transmission.

Before the GDMA controller transmits data, `GDMA_OUT_TOTAL_EOF_CH n _INT_ENA` bit should be set to enable `GDMA_OUT_TOTAL_EOF_CH n _INT` interrupt. If data in the buffer pointed by the last descriptor (with EOF) have been transmitted, a `GDMA_OUT_TOTAL_EOF_CH n _INT` interrupt is generated.

Before the GDMA controller receives data, `GDMA_IN_SUC_EOF_CH n _INT_ENA` bit should be set to enable `GDMA_IN_SUC_EOF_CH n _INT` interrupt. If a data frame or packet has been received successfully, a `GDMA_IN_SUC_EOF_CH n _INT` interrupt is generated. In addition, when GDMA channel is connected to UHCI0, the GDMA controller also supports `GDMA_IN_ERR_CH n _EOF_INT` interrupt. This interrupt is enabled by setting `GDMA_IN_ERR_EOF_CH n _INT_ENA` bit, and it indicates that a data frame or packet has been received with errors.

When detecting a `GDMA_OUT_TOTAL_EOF_CH n _INT` or a `GDMA_IN_SUC_EOF_CH n _INT` interrupt, software can record the value of `GDMA_OUT_EOF_DES_ADDR_CH n` or `GDMA_IN_SUC_EOF_DES_ADDR_CH n` field, i.e. address of the last descriptor. Therefore, software can tell which descriptors have been used and reclaim them.

Note: In this chapter, EOF of transmit descriptors refers to `suc_eof`, while EOF of receive descriptors refers to both `suc_eof` and `err_eof`.

2.4.8 Accessing Internal RAM

Any transmit and receive channels of GDMA can access `0x3FC88000 ~ 0x3FCFFFFF` in internal RAM. To improve data transfer efficiency, GDMA can send data in burst mode, which is disabled by default. This mode is enabled for receive channels by setting `GDMA_IN_DATA_BURST_EN_CH n` , and enabled for transmit channels by setting `GDMA_OUT_DATA_BURST_EN_CH n` .

Table 2-2. Descriptor Field Alignment Requirements for Accessing Internal RAM

Inlink/Outlink	Burst Mode	Size	Length	Buffer Address Pointer
Inlink	0	—	—	—
	1	Word-aligned	—	Word-aligned
Outlink	0	—	—	—
	1	—	—	—

Table 2-2 lists the requirements for descriptor field alignment when GDMA accesses internal RAM.

When burst mode is disabled, size, length, and buffer address pointer in both transmit and receive descriptors do not need to be word-aligned. That is to say, GDMA can read data of specified length (1 ~ 4095 bytes) from any start addresses in the accessible address range, or write received data of the specified length (1 ~ 4095 bytes) to any contiguous addresses in the accessible address range.

When burst mode is enabled, size, length, and buffer address pointer in transmit descriptors are also not necessarily word-aligned. However, size and buffer address pointer in receive descriptors except length should be word-aligned.

2.4.9 Accessing External RAM

Any transmit and receive channels of GDMA can access `0x3C000000 ~ 0x3DFFFFFF` in external RAM. GDMA can send data only in burst mode. The number of data bytes to transfer in one burst is defined as block size. Block size can be 16 bytes, 32 bytes or 64 bytes, configured via `GDMA_IN_EXT_MEM_BK_SIZE_CH n` for transmit channels and `GDMA_OUT_EXT_MEM_BK_SIZE_CH n` for receive channels.

Table 2-3. Descriptor Field Alignment Requirements for Accessing External RAM

Inlink/Outlink	Size	Length	Buffer Address Pointer
Inlink	Block-aligned	—	Block-aligned
Outlink	—	—	—

Table 2-3 lists the requirements for descriptor field alignment when GDMA accesses internal RAM. Size, length, and buffer address pointer in transmit descriptors do not need to be aligned. However, size and buffer address pointer in receive descriptors except length should be aligned with block size. Table 2-4 illustrates the value of

[GDMA_IN_EXT_MEM_BK_SIZE_CH \$n\$](#) or [GDMA_OUT_EXT_MEM_BK_SIZE_CH \$n\$](#) bit when fields in linked list descriptors are 16-byte, 32-byte and 64-byte aligned respectively.

Table 2-4. Relationship Between Configuration Register, Block Size and Alignment

GDMA_IN_EXT_MEM_BK_SIZE_CHn or GDMA_OUT_EXT_MEM_BK_SIZE_CHn	Block Size	Alignment
0	16 bytes	16-byte aligned
1	32 bytes	32-byte aligned
2	64 bytes	64-byte aligned

Note: For receive descriptors, if the data length received are not aligned with block size, GDMA will pad the data received with 0 until they are aligned to initiate burst transfer. You can read the length field in receive descriptors to obtain the length of valid data received.

2.4.10 External RAM Access Permissions

GDMA in ESP32-S3 has a permission control module for access to external RAM. As Figure 2-6 shows, the permission control module divided the 32 MB external RAM into four areas through three configurable boundaries, namely boundary 0, boundary 1, and boundary 2.

- Area 0: 0x3C000000 ~ boundary 0 (include 0x3C000000 but exclude boundary 0)
- Area 1: boundary 0 ~ boundary 1 (include boundary 0 but exclude boundary 1)
- Area 2: boundary 1 ~ boundary 2 (include boundary 1 but exclude boundary 2)
- Area 3: boundary 2 ~ 0x3DFFFFFF (include boundary 0)

Boundary 0, 1, and 2 are configured via [PMS_EDMA_BOUNDARY_0](#), [PMS_EDMA_BOUNDARY_1](#), and [PMS_EDMA_BOUNDARY_2](#), respectively. For details about these fields, please refer to Chapter 13 *Permission Control (PMS)*. The unit of these fields is 4 KB. For example, if [PMS_EDMA_BOUNDARY_0](#) is 0x80, the address of boundary 0 should be $0x3C000000 + 0x80 * 4 \text{ KB} = 3c080000$, in which 0x3C000000 is the starting address of accessible external RAM.

Figure 2-6. Dividing External RAM into Areas

All peripherals with GDMA feature (i.e. SPI2, SPI3, UHCI0, I2S0, I2S1, LCD/CAM, AES, SHA, ADC, and RMT) do not have access permissions for Area 0 and Area 3, but their permissions for Area 1 and Area 2 can be independently managed. The permission control module contains registers to manage such access permissions for Area 1 and Area 2. For example, the [PMS_EDMA_PMS_SPI2_ATTR1](#) field configures SPI2's permissions to

read and write Area 1. Specifically, when bit 0 of this field is 1, SPI2 is granted read permission; when bit 1 of this field is 1, SPI2 is granted write permission. Likewise, the [PMS_EDMA_PMS_SPI2_ATTR2](#) field configures SPI2's permissions to read and write Area 2.

Access violations are logged and can trigger the `GDMA_ETXMEN_REJECT_INT` interrupt. You can check the address where the address violation occurs, the peripheral involved, channel number and read or write attribute via [GDMA_ETXMEM_REJECT_ADDR](#), [GDMA_ETXMEN_REJECT_PERI_NUM](#), [GDMA_ETXMEN_REJECT_CHANNEL_NUM](#), and [GDMA_ETXMEM_REJECT_ATTR](#) respectively.

2.4.11 Seamless Access to Internal and External RAM

In some application scenarios, a data frame or packet contains data from both internal RAM and external RAM. To ensure real-time data processing, GDMA is designed in such a way that some descriptors in the linked list can be used to access internal RAM, while the other descriptors in the same linked list can be used to access external RAM. This design allows seamless access to internal and external RAM.

2.4.12 Arbitration

To ensure timely response to peripherals running at a high speed with low latency (such as SPI, LCD/CAM), the GDMA controller implements a fixed-priority channel arbitration scheme. That is to say, each channel can be assigned a priority from 0 ~ 9. The larger the number, the higher the priority, and the more timely the response. When several channels are assigned the same priority, the GDMA controller adopts a round-robin arbitration scheme.

Please note that the overall throughput of peripherals with GDMA feature cannot exceed the maximum bandwidth of the GDMA, so that requests from low-priority peripherals can be responded to.

2.4.13 Bandwidth

2.4.13.1 Bandwidth to Access Internal RAM

As an AHB master, the GDMA controller accesses memory via the AHB bus. When accessing internal RAM, GDMA competes for the AHB bus with other AHB masters such as Bluetooth, Wi-Fi, and USB OTG. Without regard to these AHB masters, the total bandwidth supported by GDMA to access internal RAM is calculated as:

All channels to access internal RAM in burst mode: $8/5 * fhclk$ MB/s;

All channels to access internal RAM not in burst mode: $4/3 * fhclk$ MB/s;

where `fhclk` is the frequency of AHB clock fixed at 80 MHz. The total bandwidth according to formulas above is listed in Table 2-5:

Table 2-5. Total Bandwidth Supported by GDMA to Access Internal RAM

fpclk	All Channels NOT in Burst Mode	All Channels in Burst Mode
80 MHz	106.6 MB/s	128 MB/s

Please note that since the GDMA controller transfers data via linked list descriptors, the data transfer volume includes the number of bytes these descriptors have. The transfer efficiency corresponding to one descriptor is $length / (length + 12)$, where `length` is the field in the descriptor, and 12 is the number of bytes a descriptor has. Therefore, applications with multiple linked list descriptors should increase length of each descriptor for higher

transfer efficiency, which can be 99.7% at most.

When allocating bandwidth to a peripheral, software can estimate the bandwidth occupied by this peripheral according to:

$$T * (length + 12) / length$$

where T stands for the throughput of this peripheral.

2.5 GDMA Interrupts

- `GDMA_OUT_TOTAL_EOF_CH n _INT`: Triggered when all data corresponding to a linked list (including multiple descriptors) have been sent via transmit channel n .
- `GDMA_IN_DSCR_EMPTY_CH n _INT`: Triggered when the size of the buffer pointed by receive descriptors is smaller than the length of data to be received via receive channel n .
- `GDMA_OUT_DSCR_ERR_CH n _INT`: Triggered when an error is detected in a transmit descriptor on transmit channel n .
- `GDMA_IN_DSCR_ERR_CH n _INT`: Triggered when an error is detected in a receive descriptor on receive channel n .
- `GDMA_OUT_EOF_CH n _INT`: Triggered when EOF in a transmit descriptor is 1 and data corresponding to this descriptor have been sent via transmit channel n . If `GDMA_OUT_EOF_MODE_CH n` is 0, this interrupt will be triggered when the last byte of data corresponding to this descriptor enters GDMA's transmit channel; if `GDMA_OUT_EOF_MODE_CH n` is 1, this interrupt is triggered when the last byte of data is taken from GDMA's transmit channel.
- `GDMA_OUT_DONE_CH n _INT`: Triggered when all data corresponding to a transmit descriptor have been sent via transmit channel n .
- `GDMA_IN_ERR_EOF_CH n _INT`: Triggered when an error is detected in the data frame or packet received via receive channel n . This interrupt is used only for UHCI0 peripheral (UART0 or UART1).
- `GDMA_IN_SUC_EOF_CH n _INT`: Triggered when a data frame or packet has been received via receive channel n .
- `GDMA_IN_DONE_CH n _INT`: Triggered when all data corresponding to a receive descriptor have been received via receive channel n .

2.6 Programming Procedures

2.6.1 Programming Procedures for GDMA's Transmit Channel

To transmit data, GDMA's transmit channel should be configured by software as follows:

1. Set `GDMA_OUT_RST_CH n` first to 1 and then to 0, to reset the state machine of GDMA's transmit channel and FIFO pointer;
2. Load an outlink, and configure `GDMA_OUTLINK_ADDR_CH n` with address of the first transmit descriptor;
3. Configure `GDMA_PERI_OUT_SEL_CH n` with the value corresponding to the peripheral to be connected, as shown in Table 2-1;
4. Set `GDMA_OUTLINK_START_CH n` to enable GDMA's transmit channel for data transfer;

5. Configure and enable the corresponding peripheral (SPI2, SPI3, UHCI0 (UART0, UART1, or UART2), I2S0, I2S1, AES, SHA, and ADC). See details in individual chapters of these peripherals;
6. Wait for `GDMA_OUT_EOF_CH n _INT` interrupt, which indicates the completion of data transfer.

2.6.2 Programming Procedures for GDMA's Receive Channel

To receive data, GDMA's receive channel should be configured by software as follows:

1. Set `GDMA_IN_RST_CH n` first to 1 and then to 0, to reset the state machine of GDMA's receive channel and FIFO pointer;
2. Load an inlink, and configure `GDMA_INLINK_ADDR_CH n` with address of the first receive descriptor;
3. Configure `GDMA_PERI_IN_SEL_CH n` with the value corresponding to the peripheral to be connected, as shown in Table 2-1;
4. Set `GDMA_INLINK_START_CH n` to enable GDMA's receive channel for data transfer;
5. Configure and enable the corresponding peripheral (SPI2, SPI3, UHCI0 (UART0, UART1, or UART2), I2S0, I2S1, AES, SHA, and ADC). See details in individual chapters of these peripherals;
6. Wait for `GDMA_IN_SUC_EOF_CH n _INT` interrupt, which indicates that a data frame or packet has been received.

2.6.3 Programming Procedures for Memory-to-Memory Transfer

To transfer data from one memory location to another, GDMA should be configured by software as follows:

1. Set `GDMA_OUT_RST_CH n` first to 1 and then to 0, to reset the state machine of GDMA's transmit channel and FIFO pointer;
2. Set `GDMA_IN_RST_CH n` first to 1 and then to 0, to reset the state machine of GDMA's receive channel and FIFO pointer;
3. Load an outlink, and configure `GDMA_OUTLINK_ADDR_CH n` with address of the first transmit descriptor;
4. Load an inlink, and configure `GDMA_INLINK_ADDR_CH n` with address of the first receive descriptor;
5. Set `GDMA_MEM_TRANS_EN_CH n` to enable memory-to-memory transfer;
6. Set `GDMA_OUTLINK_START_CH n` to enable GDMA's transmit channel for data transfer;
7. Set `GDMA_INLINK_START_CH n` to enable GDMA's receive channel for data transfer;
8. Wait for `GDMA_IN_SUC_EOF_CH n _INT` interrupt, which indicates that which indicates that a data transaction has been completed.

2.7 Register Summary

The addresses in this section are relative to **GDMA** base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
Configuration Registers			
GDMA_IN_CONF0_CH0_REG	Configuration register 0 of RX channel 0	0x0000	R/W
GDMA_IN_CONF1_CH0_REG	Configuration register 1 of RX channel 0	0x0004	R/W
GDMA_IN_POP_CH0_REG	Pop control register of RX channel 0	0x001C	varies
GDMA_IN_LINK_CH0_REG	Link descriptor configuration and control register of RX channel 0	0x0020	varies
GDMA_OUT_CONF0_CH0_REG	Configuration register 0 of TX channel 0	0x0060	R/W
GDMA_OUT_CONF1_CH0_REG	Configuration register 1 of TX channel 0	0x0064	R/W
GDMA_OUT_PUSH_CH0_REG	Push control register of RX channel 0	0x007C	varies

GDMA_OUT_EOF_BFR_DES_ADDR_CH1_REG	The last outlink descriptor address when EOF occurs of TX channel 1	0x014C	RO
GDMA_OUT_DSCR_CH1_REG	Current inlink descriptor address of TX channel 1	0x0150	RO
GDMA_OUT_DSCR_BF0_CH1_REG	The last inlink descriptor address of TX channel 1	0x0154	RO
GDMA_OUT_DSCR_BF1_CH1_REG	The second-to-last inlink descriptor address of TX channel 1	0x0158	RO
GDMA_INFIFO_STATUS_CH2_REG	Receive FIFO status of RX channel 2	0x0198	RO
GDMA_IN_STATE_CH2_REG	Receive status of RX channel 2	0x01A4	RO
GDMA_IN_SUC_EOF_DES_ADDR_CH2_REG	Inlink descriptor address when EOF occurs of RX channel 2	0x01A8	RO
GDMA_IN_ERR_EOF_DES_ADDR_CH2_REG	Inlink descriptor address when errors occur of RX channel 2	0x01AC	RO
GDMA_IN_DSCR_CH2_REG	Current inlink descriptor address of RX channel 2	0x01B0	RO
GDMA_IN_DSCR_BF0_CH2_REG	The last inlink descriptor address of RX channel 2	0x01B4	RO
GDMA_IN_DSCR_BF1_CH2_REG	The second-to-last inlink descriptor address of RX channel 2	0x01B8	RO
GDMA_OUTFIFO_STATUS_CH2_REG	Transmit FIFO status of TX channel 2	0x01F8	RO
GDMA_OUT_STATE_CH2_REG	Transmit status of TX channel 2	0x0204	RO
GDMA_OUT_EOF_DES_ADDR_CH2_REG	Outlink descriptor address when EOF occurs of TX channel 2	0x0208	RO
GDMA_OUT_EOF_BFR_DES_ADDR_CH2_REG	The last outlink descriptor address when EOF occurs of TX channel 2	0x020C	RO

Name	Description	Address	Access
GDMA_OUT_DSCR_CH2_REG	Current inlink descriptor address of TX channel 2	0x0210	RO
GDMA_OUT_DSCR_BF0_CH2_REG	The last inlink descriptor address of TX channel 2	0x0214	RO
GDMA_OUT_DSCR_BF1_CH2_REG	The second-to-last inlink descriptor address of TX channel 2	0x0218	RO
GDMA_INFIFO_STATUS_CH3_REG	Receive FIFO status of RX channel 3	0x0258	RO
GDMA_IN_STATE_CH3_REG	Receive status of RX channel 3	0x0264	RO
GDMA_IN_SUC_EOF_DES_ADDR_CH3_REG	Inlink descriptor address when EOF occurs of RX channel 3	0x0268	RO
GDMA_IN_ERR_EOF_DES_ADDR_CH3_REG	Inlink descriptor address when errors occur of RX channel 3	0x026C	RO
GDMA_IN_DSCR_CH3_REG	Current inlink descriptor address of RX channel 3	0x0270	RO
GDMA_IN_DSCR_BF0_CH3_REG	The last inlink descriptor address of RX channel 3	0x0274	RO
GDMA_IN_DSCR_BF1_CH3_REG	The second-to-last inlink descriptor address of RX channel 3	0x0278	RO
GDMA_OUTFIFO_STATUS_CH3_REG	Transmit FIFO status of TX channel 3	0x02B8	RO
GDMA_OUT_STATE_CH3_REG	Transmit status of TX channel 3	0x02C4	RO
GDMA_OUT_EOF_DES_ADDR_CH3_REG	Outlink descriptor address when EOF occurs of TX channel 3	0x02C8	RO
GDMA_OUT_EOF_BFR_DES_ADDR_CH3_REG	The last outlink descriptor address when EOF occurs of TX channel 3	0x02CC	RO
GDMA_OUT_DSCR_CH3_REG	Current inlink descriptor address of TX channel 3	0x02D0	RO
GDMA_OUT_DSCR_BF0_CH3_REG	The last inlink descriptor address of TX channel 3	0x02D4	RO
GDMA_OUT_DSCR_BF1_CH3_REG	The second-to-last inlink descriptor address of TX channel 3	0x02D8	RO
GDMA_INFIFO_STATUS_CH4_REG	Receive FIFO status of RX channel 4	0x0318	RO
GDMA_IN_STATE_CH4_REG	Receive status of RX channel 4	0x0324	RO
GDMA_IN_SUC_EOF_DES_ADDR_CH4_REG	Inlink descriptor address when EOF occurs of RX channel 4	0x0328	RO
GDMA_IN_ERR_EOF_DES_ADDR_CH4_REG	Inlink descriptor address when errors occur of RX channel 4	0x032C	RO
GDMA_IN_DSCR_CH4_REG	Current inlink descriptor address of RX channel 4	0x0330	RO
GDMA_IN_DSCR_BF0_CH4_REG	The last inlink descriptor address of RX channel 4	0x0334	RO
GDMA_IN_DSCR_BF1_CH4_REG	The second-to-last inlink descriptor address of RX channel 4	0x0338	RO
GDMA_OUTFIFO_STATUS_CH4_REG	Transmit FIFO status of TX channel 4	0x0378	RO
GDMA_OUT_STATE_CH4_REG	Transmit status of TX channel 4	0x0384	RO

Name	Description	Address	Access
GDMA_OUT_EOF_DES_ADDR_CH4_REG	Outlink descriptor address when EOF occurs of TX channel 4	0x0388	RO
GDMA_OUT_EOF_BFR_DES_ADDR_CH4_REG	The last outlink descriptor address when EOF occurs of TX channel 4	0x038C	RO
GDMA_OUT_DSCR_CH4_REG	Current inlink descriptor address of TX channel 4	0x0390	RO
GDMA_OUT_DSCR_BF0_CH4_REG	The last inlink descriptor address of TX channel 4	0x0394	RO
GDMA_OUT_DSCR_BF1_CH4_REG	The second-to-last inlink descriptor address of TX channel 4	0x0398	RO
Priority Registers			
GDMA_IN_PRI_CH0_REG	Priority register of RX channel 0	0x0044	R/W
GDMA_OUT_PRI_CH0_REG	Priority register of TX channel 0	0x00A4	R/W
GDMA_IN_PRI_CH1_REG	Priority register of RX channel 1	0x0104	R/W
GDMA_OUT_PRI_CH1_REG	Priority register of TX channel 1	0x0164	R/W
GDMA_IN_PRI_CH2_REG	Priority register of RX channel 2	0x01C4	R/W
GDMA_OUT_PRI_CH2_REG	Priority register of TX channel 2	0x0224	R/W
GDMA_IN_PRI_CH3_REG	Priority register of RX channel 3	0x0284	R/W
GDMA_OUT_PRI_CH3_REG	Priority register of TX channel 3	0x02E4	R/W
GDMA_IN_PRI_CH4_REG	Priority register of RX channel 4	0x0344	R/W
GDMA_OUT_PRI_CH4_REG	Priority register of TX channel 4	0x03A4	R/W
Peripheral Selection Registers			
GDMA_IN_PERI_SEL_CH0_REG	Peripheral selection of RX channel 0	0x0048	R/W
GDMA_OUT_PERI_SEL_CH0_REG	Peripheral selection of TX channel 0	0x00A8	R/W
GDMA_IN_PERI_SEL_CH1_REG	Peripheral selection of RX channel 1	0x0108	R/W
GDMA_OUT_PERI_SEL_CH1_REG	Peripheral selection of TX channel 1	0x0168	R/W
GDMA_IN_PERI_SEL_CH2_REG	Peripheral selection of RX channel 2	0x01C8	R/W
GDMA_OUT_PERI_SEL_CH2_REG	Peripheral selection of TX channel 2	0x0228	R/W
GDMA_IN_PERI_SEL_CH3_REG	Peripheral selection of RX channel 3	0x0288	R/W
GDMA_OUT_PERI_SEL_CH3_REG	Peripheral selection of TX channel 3	0x02E8	R/W
GDMA_IN_PERI_SEL_CH4_REG	Peripheral selection of RX channel 4	0x0348	R/W
GDMA_OUT_PERI_SEL_CH4_REG	Peripheral selection of TX channel 4	0x03A8	R/W
Permission Status Registers			
GDMA_EXTMEM_REJECT_ADDR_REG	External RAM address where access violation occurs	0x03F4	RO
GDMA_EXTMEM_REJECT_ST_REG	Status of external RAM where access violation occurs	0x03F8	RO
Version Register			
GDMA_DATE_REG	Version control register	0x040C	R/W

2.8 Registers

The addresses in this section are relative to **GDMA** base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 2.1. GDMA_IN_CONF0_CH n _REG (n : 0-4) (0x0000+192* n)

GDMA_IN_RST_CH n This bit is used to reset GDMA channel 0 RX FSM and RX FIFO pointer. (R/W)

GDMA_IN_LOOP_TEST_CH n Reserved. (R/W)

GDMA_INDSCR_BURST_EN_CH n Set this bit to 1 to enable INCR burst transfer for RX channel 0 reading descriptor when accessing internal RAM. (R/W)

GDMA_IN_DATA_BURST_EN_CH n Set this bit to 1 to enable INCR burst transfer for RX channel 0 receiving data when accessing internal RAM. (R/W)

GDMA_MEM_TRANS_EN_CH n Set this bit 1 to enable automatic transmitting data from memory to memory via GDMA. (R/W)

Register 2.2. GDMA_IN_CONF1_CH n _REG (n : 0-4) (0x0004+192* n)

(reserved)															GDMA_IN_EXT_MEM_BK_SIZE_CH0 GDMA_IN_CHECK_OWNER_CH0			GDMA_DMA_INFIFO_FULL_THRS_CH0			
31														15	14	13	12	11			0
0 0															0	0	0xc			Reset	

GDMA_DMA_INFIFO_FULL_THRS_CH n This register is used to generate the GDMA_INFIFO_FULL_WM_INT interrupt when RX channel 0 received byte number in RX FIFO is up to the value of the register. (R/W)

GDMA_IN_CHECK_OWNER_CH n Set this bit to enable checking the owner attribute of the descriptor. (R/W)

GDMA_IN_EXT_MEM_BK_SIZE_CH n Block size of RX channel 0 when GDMA access external RAM. 0: 16 bytes; 1: 32 bytes; 2: 64 bytes; 3: Reserved. (R/W)

Register 2.3. GDMA_IN_POP_CH n _REG (n : 0-4) (0x001C+192* n)

(reserved)															GDMA_INFIFO_POP_CH0			GDMA_INFIFO_RDATA_CH0		
31														13	12	11			0	
0 0															0	0	0x800			Reset

GDMA_INFIFO_RDATA_CH n This register stores the data popping from GDMA FIFO (intended for debugging). (RO)

GDMA_INFIFO_POP_CH n Set this bit to pop data from GDMA FIFO (intended for debugging). (R/W/SC)

Register 2.4. GDMA_INLINK_CH n _REG (n : 0-4) (0x0020+192* n)

(reserved)							GDMA_INLINK_PARK_CH0 GDMA_INLINK_RESTART_CH0 GDMA_INLINK_STOP_CH0 GDMA_INLINK_AUTO_RET_CH0					GDMA_INLINK_ADDR_CH0										
31						25	24	23	22	21	20	19										0
0 0 0 0 0 0 0							1	0	0	0	1	0x000										Reset

GDMA_INLINK_ADDR_CH n This register stores the 20 least significant bits of the first receive descriptor's address. (R/W)

GDMA_INLINK_AUTO_RET_CH n Set this bit to return to current receive descriptor's address, when there are some errors in current receiving data. (R/W)

GDMA_INLINK_STOP_CH n Set this bit to stop GDMA's receive channel from receiving data. (R/W/SC)

GDMA_INLINK_START_CH n Set this bit to enable GDMA's receive channel for data transfer. (R/W/SC)

GDMA_INLINK_RESTART_CH n Set this bit to mount a new receive descriptor. (R/W/SC)

GDMA_INLINK_PARK_CH n 1: the receive descriptor's FSM is in idle state; 0: the receive descriptor's FSM is working. (RO)

Register 2.5. GDMA_OUT_CONF0_CH n _REG (n : 0-4) (0x0060+192* n)

GDMA_OUT_RST_CH n This bit is used to reset GDMA channel 0 TX FSM and TX FIFO pointer. (R/W)

GDMA_OUT_LOOP_TEST_CH n Reserved. (R/W)

GDMA_OUT_AUTO_WRBACK_CH n Set this bit to enable automatic outlink-writeback when all the data in TX FIFO has been transmitted. (R/W)

GDMA_OUT_EOF_MODE_CH n EOF flag generation mode when transmitting data. 1: EOF flag for TX channel 0 is generated when data need to transmit has been popped from FIFO in GDMA. (R/W)

GDMA_OUTDSCR_BURST_EN_CH n Set this bit to 1 to enable INCR burst transfer for TX channel 0 reading descriptor when accessing internal RAM. (R/W)

GDMA_OUT_DATA_BURST_EN_CH n Set this bit to 1 to enable INCR burst transfer for TX channel 0 transmitting data when accessing internal RAM. (R/W)

Register 2.6. GDMA_OUT_CONF1_CH n _REG (n : 0-4) (0x0064+192* n)

GDMA_OUT_CHECK_OWNER_CH n Set this bit to enable checking the owner attribute of the descriptor. (R/W)

GDMA_OUT_EXT_MEM_BK_SIZE_CH n Block size of TX channel 0 when GDMA access external RAM. 0: 16 bytes; 1: 32 bytes; 2: 64 bytes; 3: Reserved. (R/W)

Register 2.7. GDMA_OUT_PUSH_CH n _REG (n : 0-4) (0x007C+192* n)

(reserved)										GDMA_OUTFIFO_PUSH_CH0			GDMA_OUTFIFO_WDATA_CH0									
31											10	9	8									0
0 0 0 0 0 0 0 0 0 0										0			0x0								Reset	

GDMA_OUTFIFO_WDATA_CH n This register stores the data that need to be pushed into GDMA FIFO. (R/W)

GDMA_OUTFIFO_PUSH_CH n Set this bit to push data into GDMA FIFO. (R/W/SC)

Register 2.8. GDMA_OUT_LINK_CH n _REG (n : 0-4) (0x0080+192* n)

(reserved)										GDMA_OUTLINK_PARK_CH0			GDMA_OUTLINK_RESTART_CH0			GDMA_OUTLINK_START_CH0			GDMA_OUTLINK_STOP_CH0			GDMA_OUTLINK_ADDR_CH0							
31											24	23	22	21	20	19													0
0 0 0 0 0 0 0 0 0 0										1			0 0 0			0x000												Reset	

GDMA_OUTLINK_ADDR_CH n This register stores the 20 least significant bits of the first transmit descriptor's address. (R/W)

GDMA_OUTLINK_STOP_CH n Set this bit to stop GDMA's transmit channel from transferring data. (R/W/SC)

GDMA_OUTLINK_START_CH n Set this bit to enable GDMA's transmit channel for data transfer. (R/W/SC)

GDMA_OUTLINK_RESTART_CH n Set this bit to restart a new outlink from the last address. (R/W/SC)

GDMA_OUTLINK_PARK_CH n 1: the transmit descriptor's FSM is in idle state; 0: the transmit descriptor's FSM is working. (RO)

Register 2.9. GDMA_PD_CONF_REG (0x03C4)

(reserved)															GDMA_DMA_RAM_CLK_FO			GDMA_DMA_RAM_FORCE_PU			GDMA_DMA_RAM_FORCE_PD			(reserved)		
31																7	6	5	4	3				0		
0															0	1	0	0	0	0	0	Reset				

GDMA_DMA_RAM_FORCE_PD Set this bit to force power down GDMA internal memory. (R/W)

GDMA_DMA_RAM_FORCE_PU Set this bit to force power up GDMA internal memory. (R/W)

GDMA_DMA_RAM_CLK_FO 1: Force to open the clock and bypass the gate-clock when accessing the RAM in GDMA; 0: A gate-clock will be used when accessing the RAM in GDMA. (R/W)

Register 2.10. GDMA_MISC_CONF_REG (0x03C8)

(reserved)															GDMA_CLK_EN		GDMA_ARB_PRI_DIS		GDMA_AHBM_RST_EXTER		GDMA_AHBM_RST_INTER		
31																5	4	3	2	1	0	Reset	
0															0	0	0	0	0	0			

GDMA_AHBM_RST_INTER Set this bit, then clear this bit to reset the internal AHB FSM. (R/W)

GDMA_AHBM_RST_EXTER Set this bit, then clear this bit to reset the external AHB FSM. (R/W)

GDMA_ARB_PRI_DIS Set this bit to disable priority arbitration function. (R/W)

GDMA_CLK_EN 1: Force clock on for registers; 0: Support clock only when application writes registers. (R/W)

Register 2.11. GDMA_IN_INT_RAW_CH n _REG (n : 0-4) (0x0008+192* n)

31	6	5	4	3	2	1	0	Reset
0	0	0	0	0	0	0	0	

(reserved)

GDMA_INFIFO_FULL_WM_CH0_INT_RAW
 GDMA_IN_DSCR_EMPTY_CH0_INT_RAW
 GDMA_IN_DSCR_ERR_CH0_INT_RAW
 GDMA_IN_ERR_EOF_CH0_INT_RAW
 GDMA_IN_SUC_EOF_CH0_INT_RAW
 GDMA_IN_DONE_CH0_INT_RAW

GDMA_IN_DONE_CH n _INT_RAW The raw interrupt bit turns to high level when the last data pointed by one receive descriptor has been received for RX channel 0. (R/WTC/SS)

GDMA_IN_SUC_EOF_CH n _INT_RAW The raw interrupt bit turns to high level when the last data pointed by one receive descriptor has been received for RX channel 0. For UHCI0, the raw interrupt bit turns to high level when the last data pointed by one receive descriptor has been received and no data error is detected for RX channel 0. (R/WTC/SS)

GDMA_IN_ERR_EOF_CH n _INT_RAW The raw interrupt bit turns to high level when data error is detected only in the case that the peripheral is UHCI0 for RX channel 0. For other peripherals, this raw interrupt is reserved. (R/WTC/SS)

GDMA_IN_DSCR_ERR_CH n _INT_RAW The raw interrupt bit turns to high level when detecting receive descriptor error, including owner error, the second and third word error of receive descriptor for RX channel 0. (R/WTC/SS)

GDMA_IN_DSCR_EMPTY_CH n _INT_RAW The raw interrupt bit turns to high level when RX FIFO pointed by inlink is full and receiving data is not completed, but there is no more inlink for RX channel 0. (R/WTC/SS)

GDMA_INFIFO_FULL_WM_CH n _INT_RAW The raw interrupt bit turns to high level when received data byte number is up to threshold configured by GDMA_DMA_INFIFO_FULL_THRS_CH0 in RX FIFO of RX channel 0. (R/WTC/SS)

Register 2.12. GDMA_IN_INT_ST_CH n _REG (n : 0-4) (0x000C+192* n)

(reserved)																				GDMA_INFIFO_FULL_WM_CH0_INT_ST GDMA_IN_DSCR_EMPTY_CH0_INT_ST GDMA_IN_DSCR_ERR_EOF_CH0_INT_ST GDMA_IN_SUC_EOF_CH0_INT_ST GDMA_IN_DONE_CH0_INT_ST

GDMA_EXTMEM_REJECT_ATTR Read or write attribute of the rejected access. Bit 0: if this bit is 1, the rejected access is READ. Bit 1: if this bit is 1, the rejected access is WRITE. (RO)

GDMA_EXTMEM_REJECT_CHANNEL_NUM This field indicates the channel used for the rejected access. (RO)

GDMA_EXTMEM_REJECT_PERI_NUM This bit indicates the peripheral whose access was rejected. (RO)

Register 2.43. GDMA_DATE_REG (0x040C)

GDMA_DATE This is the version control register. (R/W)

3 System and Memory

3.1 Overview

The ESP32-S3 is a dual-core system with two Harvard Architecture Xtensa® LX7 CPUs. All internal memory, external memory, and peripherals are located on the CPU buses.

3.2 Features

- **Address Space**
 - 848 KB of internal memory address space accessed from the instruction bus
 - 560 KB of internal memory address space accessed from the data bus
 - 836 KB of peripheral address space
 - 32 MB of external memory virtual address space accessed from the instruction bus
 - 32 MB external memory virtual address space accessed from the data bus
 - 480 KB of internal DMA address space
 - 32 MB of external DMA address space
- **Internal Memory**
 - 384 KB Internal ROM
 - 512 KB Internal SRAM
 - 8 KB RTC FAST Memory
 - 8 KB RTC SLOW Memory
- **External Memory**
 - Supports up to 1 GB external flash
 - Supports up to 1 GB external RAM
- **Peripheral Space**
 - 45 modules/peripherals in total
- **GDMA**
 - 11 GDMA-supported modules/peripherals

Figure 3-1 illustrates the system structure and address mapping.

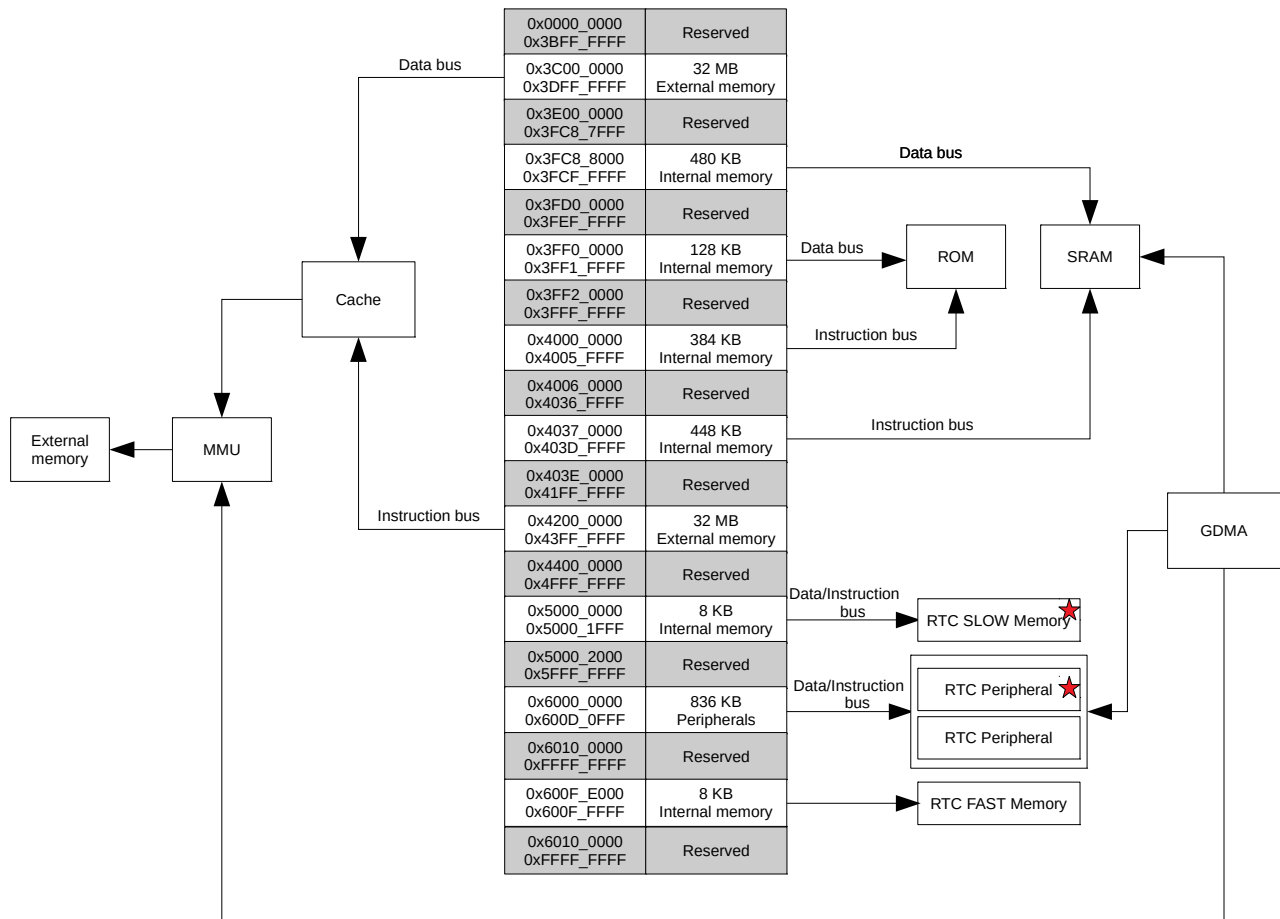

Figure 3-1. System Structure and Address Mapping

Note:

- The address space with gray background is not available to users.
- The memory or peripheral marked with a red pentagram can be accessed by the ULP co-processor.
- The range of addresses available in the address space may be larger than the actual available memory of a particular type.

3.3 Functional Description

3.3.1 Address Mapping

The system contains two Harvard Architecture Xtensa® LX7 CPUs, and both can access the same range of address space.

Addresses below 0x4000_0000 are accessed using the data bus. Addresses in the range of 0x4000_0000 ~ 0x4FFF_FFFF are accessed using the instruction bus. Addresses over and including 0x5000_0000 are shared by both data bus and instruction bus.

Both data bus and instruction bus are little-endian. The CPU can access data via the data bus using single-byte, double-byte, 4-byte and 16-byte alignment. The CPU can also access data via the instruction bus, but only in

4-byte aligned manner; non-aligned data access will cause a CPU exception.

The CPU can:

- directly access the internal memory via both data bus and instruction bus;
- directly access the external memory which is mapped into the address space via cache;
- directly access modules/peripherals via data bus.

Figure 3-1 lists the address ranges on the data bus and instruction bus and their corresponding target memory.

Some internal and external memory can be accessed via both data bus and instruction bus. In such cases, the CPU can access the same memory using multiple addresses.

3.3.2 Internal Memory

The ESP32-S3 consists of the following three types of internal memory:

- Internal ROM (384 KB): The internal ROM is a read-only memory and cannot be programmed. Internal ROM contains the ROM code (software instructions and some software read-only data) of some low level system software.
- Internal SRAM (512 KB): The Internal Static RAM (SRAM) is a volatile memory that can be quickly accessed by the CPU (generally within a single CPU clock cycle).
 - A part of the SRAM can be configured to operate as a cache for external memory access, which cannot be accessed by CPU in such case.
 - Some parts of the SRAM can only be accessed via the CPU's instruction bus.
 - Some parts of the SRAM can only be accessed via the CPU's data bus.
 - Some parts of the SRAM can be accessed via both the CPU's instruction bus and the CPU's data bus.
- RTC Memory (16 KB): The RTC (Real Time Clock) memory implemented as Static RAM (SRAM) and thus is volatile. However, RTC memory has the added feature of being persistent throughout deep sleep (i.e., the RTC memory retains its values throughout deep sleep).
 - RTC FAST Memory (8 KB): RTC FAST memory can only be accessed by the CPU, and cannot be accessed by the ULP co-processor. It is generally used to store instructions and data that needs to persist across a deep sleep.
 - RTC SLOW Memory (8 KB): The RTC SLOW memory can be accessed by both the CPU and the ULP co-processor, and thus is generally used to store instructions and share data between the CPU and the ULP co-processor.

Based on the three different types of internal memory described above, the internal memory of the ESP32-S3 is split into four segments: Internal ROM (384 KB), Internal SRAM (512 KB), RTC FAST Memory (8 KB) and RTC SLOW Memory (8 KB). However, within each segment, there may be different bus access restrictions (e.g., some parts of the segment may only be accessible by the CPU's instruction bus). Therefore, some segments are also further divided down into parts. Table 3-1 describes each part of internal memory and their address ranges on the data bus and/or instruction bus.

Table 3-1. Internal Memory Address Mapping

Bus Type	Boundary Address		Size (KB)	Target
	Low Address	High Address		
Data bus	0x3FF0_0000	0x3FF1_FFFF	128	Internal ROM 1
	0x3FC8_0000	0x3FCE_FFFF	416	Internal SRAM 1
	0x3FCF_0000	0x3FCF_FFFF	64	Internal SRAM 2
Instruction bus	0x4000_0000	0x4003_FFFF	256	Internal ROM 0
	0x4004_0000	0x4005_FFFF	128	Internal ROM 1
	0x4037_0000	0x4037_7FFF	32	Internal SRAM 0
	0x4037_8000	0x403D_FFFF	416	Internal SRAM 1
Data/Instruction bus	0x5000_0000	0x5000_1FFF	8	RTC SLOW Memory
	0x600F_E000	0x600F_FFFF	8	RTC FAST Memory

Note:

All of the internal memories are managed by Permission Control module. An internal memory can only be accessed when it is allowed by Permission Control, then the internal memory can be available to the CPU. For more information about Permission Control, please refer to Chapter 13 *Permission Control (PMS)*.

1. Internal ROM 0

Internal ROM 0 is a 256 KB, read-only memory space, addressed by the CPU only through the instruction bus, as shown in Table 3-1.

2. Internal ROM 1

Internal ROM 1 is a 128 KB, read-only memory space, addressed by the CPU through the instruction bus via 0x4004_0000 ~ 0x4005_FFFF or through the data bus via 0x3FF0_0000 ~ 0x3FF1_FFFF in the same order, as shown in Table 3-1.

This means, for example, address 0x4005_0000 and 0x3FF0_0000 correspond to the same word, 0x4005_0004 and 0x3FF0_0004 correspond to the same word, 0x4005_0008 and 0x3FF0_0008 correspond to the same word, etc (same below).

3. Internal SRAM 0

Internal SRAM 0 is a 32 KB, read-and-write memory space, addressed by the CPU through the instruction bus, as shown in Table 3-1.

A 16 KB or the total 32 KB of this memory space can be configured as instruction cache (ICache) to store instructions or read-only data of the external memory. In this case, the occupied memory space cannot be accessed by the CPU, while the remaining can still be accessed by the CPU.

4. Internal SRAM 1

Internal SRAM 1 is a 416 KB, read-and-write memory space, addressed by the CPU through the data bus or instruction bus in the same order, as shown in Table 3-1.

The total 416 KB memory space comprises multiple 8 KB and 16 KB memory (sub-memory) blocks. A memory block (up to 16 KB) can be used as a Trace Memory, in which case this block can still be accessed by the CPU.

5. Internal SRAM 2

Internal SRAM 2 is a 64 KB, read-and-write memory space, addressed by the CPU through the data bus, as shown in Table 3-1.

A 32 KB or the total 64 KB can be configured as data cache (DCache) to cache data of the external memory. The space used as DCache cannot be accessed by the CPU, while the remaining space can still be accessed by the CPU.

6. RTC FAST Memory

RTC FAST Memory is a 8 KB, read-and-write SRAM, addressed by the CPU through the data/instruction bus via the shared address 0x600F_E000 ~ 0x600F_FFFF, as described in Table 3-1.

7. RTC SLOW Memory

RTC SLOW Memory is a 8 KB, read-and-write SRAM, addressed by the CPU through the data/instruction bus via shared address 0x5000_E000 ~ 0x5001_FFFF, as described in Table 3-1.

RTC SLOW Memory can also be used as a peripheral addressable to the CPU via 0x6002_1000 ~ 0x6002_2FFF.

3.3.3 External Memory

ESP32-S3 supports SPI, Dual SPI, Quad SPI, Octal SPI, QPI, and OPI interfaces that allow connection to external flash and RAM. It also supports hardware encryption and decryption based on XTS_AES algorithm to protect users' programs and data in the external flash and RAM.

3.3.3.1 External Memory Address Mapping

The CPU accesses the external memory via the cache. According to information inside the MMU (Memory Management Unit), the cache maps the CPU's instruction/data bus address into a physical address of the external flash and RAM. Due to this address mapping, ESP32-S3 can address up to 1 GB external flash and 1 GB external RAM.

Using the cache, ESP32-S3 is able to support the following address space mappings at a time:

- Up to 32 MB instruction bus address space can be mapped to the external flash or RAM as individual 64 KB blocks via the ICache. 4-byte aligned reads and fetches are supported.
- Up to 32 MB data bus address space can be mapped to the external RAM as individual 64 KB blocks via the DCache. Single-byte, double-byte, 4-byte, 16-byte aligned reads and writes are supported. This address space can also be mapped to the external flash or RAM for read operations only.

Table 3-2 lists the mapping between the cache and the corresponding address ranges on the data bus and instruction bus.

Table 3-2. External Memory Address Mapping

Bus Type	Boundary Address		Size (MB)	Target
	Low Address	High Address		
Data bus	0x3C00_0000	0x3DFF_FFFF	32	DCache
Instruction bus	0x4200_0000	0x43FF_FFFF	32	ICache

Note:

Only if the CPU obtains permission for accessing the external memory, can it be responded for memory access. For more detailed information about permission control, please refer to Chapter 13 *Permission Control (PMS)*.

3.3.3.2 Cache

As shown in Figure 3-2, ESP32-S3 has a dual-core-shared ICache and DCache structure, which allows prompt response upon simultaneous requests from the instruction bus and data bus. Some internal memory space can be used as cache (see Internal SRAM 0 and Internal SRAM 2 in Section 3.3.2).

When the instruction bus of two cores initiate a request on ICache simultaneously, the arbiter determines which core gets the access to the ICache first; when the data bus of two cores initiate a request on DCache simultaneously, the arbiter determines which gets the access to the DCache first. When a cache miss occurs, the cache controller will initiate a request to the external memory. When ICache and DCache initiate requests on the

external memory simultaneously, the arbiter determines which gets the access to the external memory first. The size of ICache can be configured to 16 KB or 32 KB, while its block size can be configured to 16 B or 32 B. When an ICache is configured to 32 KB, its block cannot be 16 B. The size of DCache can be configured to 32 KB or 64 KB, while its block size can be configured to 16 B, 32 B or 64 B. When a DCache is configured to 64 KB, its block cannot be 16 B.

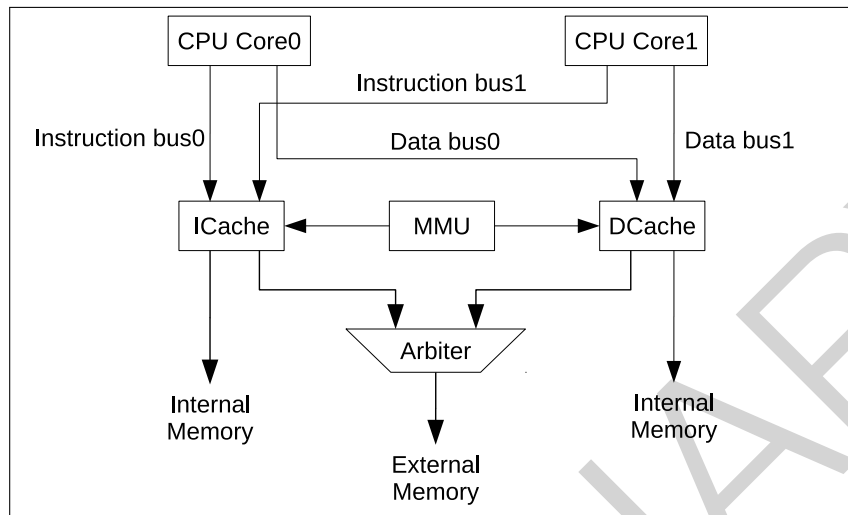

Figure 3-2. Cache Structure

3.3.3.3 Cache Operations

ESP32-S3 caches support the following operations:

1. **Write-Back:** This operation is used to clear the dirty bits in dirty blocks and update the new data to the external memory. After the write-back operation finished, both the external memory and the cache are bearing the new data. The CPU can then read/write the data directly from the cache. Only DCache has this function.

If the data in the cache is newer than the one stored in the external memory, then the new data will be considered as a dirty block. The cache tracks these dirty blocks through their dirty bits. When the dirty bits of a data are cleared, the cache will consider the data as new.

2. **Clean:** This operation is used to clear dirty bits in the dirty block, without updating data to the external memory. After the clean operation finish, there will still be old data stored in the external memory, while the cache keeps the new one (but the cache does not know about this). The CPU can then read/write the data directly from the cache. Only DCache has this function.
3. **Invalidate:** This operation is used to remove valid data in the cache. Even if the data is a dirty block mentioned above, it will not be updated to the external memory. But for the non-dirty data, it will be only stored in the external memory after this operation. The CPU needs to access the external memory in order to read/write this data. As for the dirty blocks, they will be totally lost with only old data in the external memory after this operation. There are two types of invalidate operation: automatic invalidation (Auto-Invalidate) and manual invalidation (Manual-Invalidate). Manual-Invalidate is performed only on data in the specified area in the cache, while Auto-Invalidate is performed on all data in the cache. Both ICache and DCache have this function.
4. **Preload:** This operation is to load instructions and data into the cache in advance. The minimum unit of

preload-operation is one block. There are two types of preload-operation: manual preload (Manual-Preload) and automatic preload (Auto-Preload). Manual-Preload means that the hardware prefetches a piece of continuous data according to the virtual address specified by the software. Auto-Preload means the hardware prefetches a piece of continuous data according to the current address where the cache hits or misses (depending on configuration). Both ICache and DCache have this function.

5. **Lock/Unlock:** The lock operation is used to prevent the data in the cache from being easily replaced. There are two types of lock: prelock and manual lock. When prelock is enabled, the cache locks the data in the specified area when filling the missing data to cache memory, while the data outside the specified area will not be locked. When manual lock is enabled, the cache checks the data that is already in the cache memory and locks the data only if it falls in the specified area, and leaves the data outside the specified area unlocked. When there are missing data, the cache will replace the data in the unlocked way first, so the data in the locked way is always stored in the cache and will not be replaced. But when all ways within the cache are locked, the cache will replace data, as if it was not locked. Unlocking is the reverse of locking, except that it only can be done manually. Both ICache and DCache have this function.

Please note that the writing-back, cleaning and Manual-Invalidate operations will only work on the unlocked data. If you expect to perform such operations on the locked data, please unlock them first.

3.3.4 GDMA Address Space

The GDMA (General Direct Memory Access) peripheral in ESP32-S3 can provide DMA (Direct Memory Access) services including:

- Data transfers between different locations of internal memory;
- Data transfers between internal memory and external memory;
- Data transfers between different locations of external memory.

GDMA uses the same addresses as the CPU's data bus to access Internal SRAM 1 and Internal SRAM 2. Specifically, GDMA uses address range 0x3FC8_8000 ~ 0x3FCE_FFFF to access Internal SRAM 1 and 0x3FCF_0000 ~ 0x3FCF_FFFF to access Internal SRAM 2. Note that GDMA cannot access the internal memory occupied by cache.

In addition, GDMA can access the external memory (only RAM) via the same address as CPU accessing DCache (0x3C00_0000 ~ 0x3DFF_FFFF). When DCache and GDMA access the external memory simultaneously, the software needs to make sure the data is consistent.

Besides, some peripherals/modules of the ESP32-S3 can work together with GDMA. In these cases, GDMA can provide the following powerful services for them:

- Data transfers between modules/peripherals and internal memory;
- Data transfers between modules/peripherals and external memory.

There are 11 peripherals/modules that can work together with GDMA. As shown in Figure 3-3, these 11 vertical lines in turn correspond to these 11 peripherals/modules with GDMA function, the horizontal line represents a certain channel of GDMA (can be any channel), and the intersection of the vertical line and the horizontal line indicates that a peripheral/module has the ability to access the corresponding channel of GDMA. If there are multiple intersections on the same line, it means that these peripherals/modules cannot enable the GDMA function at the same time.

Figure 3-3. Peripherals/modules that can work with GDMA

These peripherals/modules can access any memory available to GDMA. For more information, please refer to Chapter 2 *GDMA Controller (GDMA)*.

Note:

When accessing a memory via GDMA, a corresponding access permission is needed, otherwise this access may fail. For more information about permission control, please refer to Chapter 13 *Permission Control (PMS)*.

3.3.5 Modules/Peripherals

The CPU can access modules/peripherals via 0x6000_0000 ~ 0x600D_0FFF shared by the data/instruction bus.

3.3.5.1 Module/Peripheral Address Mapping

Table 3-3 lists all the modules/peripherals and their respective address ranges. Note that the address space of specific modules/peripherals is defined by "Boundary Address" (including both Low Address and High Address).

Table 3-3. Module/Peripheral Address Mapping

Target	Boundary Address		Size (KB)	Notes

Note:

1. The address space in this module/peripheral is not continuous.
2. The CPU needs to obtain the access permission to a certain module/peripheral when initiating a request to access it, otherwise it may fail. For more information of permission control, please see Chapter 13 *Permission Control (PMS)*.

4 eFuse Controller

4.1 Overview

The ESP32-S3 contains a 4-Kbit eFuse to store parameters. These parameters are burned and read by an eFuse Controller. Once an eFuse bit is programmed to 1, it can never be reverted to 0. The eFuse controller programs individual bits of parameters in eFuse according to users configurations. Some of these parameters can be read by users using the eFuse controller. If read-protection for some data is not enabled, that data is readable from outside the chip. If read-protection is enabled, that data can not be read from outside the chip. In all cases, however, some keys stored in eFuse can still be used internally by hardware cryptography modules such as Digital Signature, HMAC, etc., without exposing this data to the outside world.

4.2 Features

- 4-Kbit in total, with 1792 bits available for users
- One-time programmable storage
- Configurable write protection
- Configurable read protection
- Various hardware encoding schemes protect against data corruption

4.3 Functional Description

4.3.1 Structure

The eFuse data is organized in 11 blocks (BLOCK0 ~ BLOCK10). BLOCK0 has 640 bits in total. BLOCK1 has 288 bits and each block of BLOCK2 ~ 10 has 352 bits.

BLOCK0, which holds most parameters, has 25 bits that are readable but useless to users (the details are showed in Section 4.3.2), and 29 further bits are reserved for future use.

Table 4-1 lists all the parameters in BLOCK0 and their offsets, bit widths, as well as information on whether they can be used by hardware, which bits are write-protected, and corresponding descriptions.

The `EFUSE_WR_DIS` parameter is used to disable the writing of other parameters, while `EFUSE_RD_DIS` is used to disable users from reading BLOCK4 ~ BLOCK10. For more information on these two parameters, please see Section 4.3.1.1 and Section 4.3.1.2.

Table 4-1. Parameters in eFuse BLOCK0

Parameters	Bit Width	Accessible by Hardware	Programming-Protection by EFUSE_WR_DIS Bit Number	Description
EFUSE_WR_DIS	32	Y	N/A	Disable writing of individual eFuses.
EFUSE_RD_DIS	7	Y	0	Disable users from reading eFuse blocks BLOCK4 ~ 10.
EFUSE_DIS_ICACHE	1	Y	2	Disable ICache.
EFUSE_DIS_DCACHE	1	Y	2	Disable DCache.
EFUSE_DIS_DOWNLOAD_ICACHE	1	Y	2	Disable ICache in Download mode.
EFUSE_DIS_DOWNLOAD_DCACHE	1	Y	2	Disable DCache in Download mode.
EFUSE_DIS_FORCE_DOWNLOAD	1	Y	2	Disable chip from force-entering Download mode.
EFUSE_DIS_USB_OTG	1	Y	2	Disable USB OTG.
EFUSE_DIS_TWAI	1	Y	2	Disable TWAI Controller.
EFUSE_DIS_APP_CPU	1	Y	2	Disable APP CPU.
EFUSE_SOFT_DIS_JTAG	3	Y	31	Disable JTAG by programming odd number of bits. If JTAG is disabled by this way, users can re-enable JTAG via HMAC peripheral.
EFUSE_DIS_PAD_JTAG	1	Y	2	Hardware Disable JTAG permanently.
EFUSE_DIS_DOWNLOAD_MANUAL_ENCRYPT	1	Y	2	Disable flash encryption in Download boot mode.
EFUSE_USB_EXCHG_PINS	1	Y	30	Swap USB D+/D- pins.
EFUSE_EXT_PHY_ENABLE	1	N	30	Enable external USB PHY.
EFUSE_VDD_SPI_XPD	1	Y	3	Power up the VDD_SPI regulator if EFUSE_VDD_SPI_FORCE is 1.
EFUSE_VDD_SPI_TIEH	1	Y	3	Select voltage for VDD_SPI if VDD_SPI_FORCE is 1. 0: connect VDD_SPI to 1.8 V LDO; 1: connect VDD_SPI to VDD_RTC_IO.
EFUSE_VDD_SPI_FORCE	1	Y	3	Set to use EFUSE_VDD_SPI_XPD and EFUSE_VDD_SPI_TIEH to configure VDD_SPI LDO.
EFUSE_WDT_DELAY_SEL	2	Y	3	Select RTC WDT timeout threshold.

Table 4-1 – cont'd from previous page

Parameters	Bit Width	Accessible by Hardware	Programming-Protection by EFUSE_WR_DIS Bit Number	Description
EFUSE_SPI_BOOT_CRYPT_CNT	3	Y	4	Enable SPI boot encryption and decryption. This feature is enabled when an odd number of bits is set in this parameter, otherwise it is disabled.
EFUSE_SECURE_BOOT_KEY_REVOKE0	1	N	5	Revoke the first secure boot key when enabled.
EFUSE_SECURE_BOOT_KEY_REVOKE1	1	N	6	Revoke the second secure boot key when enabled.
EFUSE_SECURE_BOOT_KEY_REVOKE2	1	N	7	Revoke the third secure boot key when enabled.
EFUSE_KEY_PURPOSE_0	4	Y	8	Key0 purpose, see Table 4-2.
EFUSE_KEY_PURPOSE_1	4	Y	9	Key1 purpose, see Table 4-2.
EFUSE_KEY_PURPOSE_2	4	Y	10	Key2 purpose, see Table 4-2.
EFUSE_KEY_PURPOSE_3	4	Y	11	Key3 purpose, see Table 4-2.
EFUSE_KEY_PURPOSE_4	4	Y	12	Key4 purpose, see Table 4-2.
EFUSE_KEY_PURPOSE_5	4	Y	13	Key5 purpose, see Table 4-2.
EFUSE_SECURE_BOOT_EN	1	N	15	Enable secure boot.
EFUSE_SECURE_BOOT_AGGRESSIVE_REVOKE	1	N	16	Enable aggressive Secure boot key revocation mode.
EFUSE_DIS_USB_JTAG	1	Y	2	Set to disable the function of usb_serial_jtag that switch usb to jtag.
EFUSE_DIS_USB_SERIAL_JTAG	1	Y	2	Set to disable usb_serial_jtag module.
EFUSE_STRAP_JTAG_SEL	1	Y	2	Enable selection between usb_to_jtag or pad_to_jtag through GPIO3. 0: pad_to_jtag; 1: usb_to_jtag.
EFUSE_USB_PHY_SEL	1	Y	2	Select internal/external PHY for USB OTG and usb_serial_jtag. 0: internal PHY for usb_serial_jtag, external PHY for USB OTG; 1: internal PHY for USB OTG, external PHY for usb_serial_jtag.
EFUSE_FLASH_TPUW	4	N	18	Configure flash startup delay after SoC being powered up (the unit is ms/2). When the value is 15, delay will be 7.5 ms.
EFUSE_DIS_DOWNLOAD_MODE	1	N	18	Disable all download boot modes.
EFUSE_DIS_LEGACY_SPI_BOOT	1	N	18	Disable Legacy SPI boot mode.

Cont'd on next page

Table 4-1 – cont'd from previous page

Parameters	Bit Width	Accessible by Hardware	Programming-Protection by EFUSE_WR_DIS Bit Number	Description
EFUSE_UART_PRINT_CHANNEL	1	N	18	Select UART channel for printing boot information. 0: UART0; 1: UART1.
EFUSE_FLASH_ECC_MODE	1	N	18	Set ECC mode for SPI flash. 0: 16-to-18-byte mode; 1: 16-to-17-byte mode.
EFUSE_DIS_USB_DOWNLOAD_MODE	1	N	18	Disable the USB OTG download feature in UART download boot mode.
EFUSE_ENABLE_SECURITY_DOWNLOAD	1	N	18	Enable UART secure download mode (read/write flash only).
EFUSE_UART_PRINT_CONTROL	2	N	18	Set UART boot message output mode. 2'b00: Force print; 2'b01: Low-level print, controlled by GPIO46; 2'b10: High-level print, controlled by GPIO46; 2'b11: Print force disabled.
EFUSE_PIN_POWER_SELECTION	1	N	18	Select power for GPIO33 ~ GPIO37. 0: VDD3P3_CPU; 1: VDD_SPI.
EFUSE_FLASH_TYPE	1	N	18	Flash type. 0: 4 data lines; 1: 8 data lines.
EFUSE_FLASH_PAGE_SIZE	2	N	18	Set the page size of flash.
EFUSE_FLASH_ECC_EN	1	N	18	Enable ECC function in Flash boot mode.
EFUSE_FORCE_SEND_RESUME	1	N	18	Force ROM code to send an SPI flash resume command during SPI boot.
EFUSE_SECURE_VERSION	16	N	18	Secure version (used by ESP-IDF anti-rollback feature).
EFUSE_ERR_RST_ENABLE	1	N	19	1: Use BLOCK0 to check error record registers; 0: disable error register check.

Table 4-2 lists all key purpose and their values. Setting the eFuse parameter EFUSE_KEY_PURPOSE_*n* declares the purpose of KEY_{*n*} (*n*: 0 ~ 5).

Table 4-2. Secure Key Purpose Values

Key Purpose Values	Purposes
0	User purposes
1	Reserved
2	XTS_AES_256_KEY_1 (flash/SRAM encryption and decryption)
3	XTS_AES_256_KEY_2 (flash/SRAM encryption and decryption)
4	XTS_AES_128_KEY (flash/SRAM encryption and decryption)
5	HMAC Downstream mode
6	JTAG in HMAC Downstream mode
7	Digital Signature peripheral in HMAC Downstream mode
8	HMAC Upstream mode
9	SECURE_BOOT_DIGEST0 (secure boot key digest)
10	SECURE_BOOT_DIGEST1 (secure boot key digest)
11	SECURE_BOOT_DIGEST2 (secure boot key digest)

Table 4-3 provides the details of parameters in BLOCK1 ~ BLOCK10.

BLOCK	Parameters	Bit Width	Accessible by Hardware	Write Protection by EFUSE_WR_DIS Bit Number	Read Protection by EFUSE_RD_DIS Bit Number	Description
BLOCK10	EFUSE_SYS_DATA_PART2	256	N	29	6	System data

Among these blocks, BLOCK4 ~ 9 store KEY0 ~ 5, respectively. Up to six 256-bit keys can be written into eFuse. Whenever a key is written, its purpose value should also be written (see table 4-2). For example, when a key for the JTAG function in HMAC Downstream mode is written to KEY3 (i.e., BLOCK7), its key purpose value 6 should also be written to EFUSE_KEY_PURPOSE_3.

BLOCK1 ~ BLOCK10 use the RS coding scheme, so there are some restrictions on writing to these parameters. For more detailed information, please refer to Section 4.3.1.3 and 4.3.2.

4.3.1.1 EFUSE_WR_DIS

Parameter EFUSE_WR_DIS determines whether individual eFuse parameters are write-protected. After EFUSE_WR_DIS has been programmed, execute an eFuse read operation to let the new values take effect (see Section 4.3.3).

Column “Write Protection by EFUSE_WR_DIS Bit Number” in Table 4-1 and Table 4-3 list the specific bits in EFUSE_WR_DIS that disable writing.

When the write protection bit of a parameter is set to 0, it means that this parameter is not write-protected and can be programmed.

Setting the write protection bit of a parameter to 1 enables write-protection for it and none of its bits can be modified afterwards. Non-programmed bits always remain 0 while programmed bits always remain 1.

4.3.1.2 EFUSE_RD_DIS

Only the eFuse blocks BLOCK4 ~ BLOCK10 can be individually read protected to prevent any access from outside the chip, as shown in column “Read Protection by EFUSE_RD_DIS Bit Number” of Table 4-3. After EFUSE_RD_DIS has been programmed, execute an eFuse read operation to let the new values take effect (see Section 4.3.3).

If a bit in EFUSE_RD_DIS is 0, then the eFuse block can be read by users; if a bit in EFUSE_RD_DIS is 1, then the parameter controlled by this bit is user read protected.

Other parameters that are not in BLOCK4 ~ BLOCK10 can always be read by users.

When BLOCK4 ~ BLOCK10 are set to be read-protected, the data in these blocks are not readable by users, but they can still be used internally by hardware cryptography modules, if the EFUSE_KEY_PURPOSE_*n* bit is set accordingly.

4.3.1.3 Data Storage

According to the different types of eFuse bits, eFuse controller use two hardware encoding schemes to protect eFuse bits from corruption.

All BLOCK0 parameters except for EFUSE_WR_DIS are stored with four backups, meaning each bit is stored four times. This scheme is transparent to the user. This encoding scheme is invisible for users.

BLOCK1 ~ BLOCK10 store key data and some parameters and use RS (44, 32) coding scheme that supports up to 6 bytes of automatic error correction. The primitive polynomial of RS (44, 32) is

$$p(x) = x^8 + x^4 + x^3 + x^2 + 1.$$

The shift register circuit shown in Figure 4-1 and 4-2 processes 32 data bytes using RS (44, 32). This coding scheme encodes 32 bytes of data into 44 bytes:

Figure 4-1. Shift Register Circuit (output of first 32 bytes)

Figure 4-2. Shift Register Circuit (output of last 12 bytes)

- Bytes [0:31] are the data bytes itself
- Bytes [32:43] are the encoded parity bytes stored in 8-bit flip-flops DFF1, DFF2, ..., DFF12 (gf_mul_n, where n is an integer, is the result of multiplying a byte of data ...)

After that, the hardware burns into eFuse the 44-byte codeword consisting of the data bytes followed by the parity bytes.

When the eFuse block is read back, the eFuse controller automatically decodes the codeword and applies error correction if needed.

Because the RS check codes are generated on the entire 256-bit eFuse block, each block can only be written once.

4.3.2 Programming of Parameters

The eFuse controller can only program eFuse parameters of one block at a time. BLOCK0 ~ BLOCK10 share the same address range to store the parameters to be programmed. Configure parameter `EFUSE_BLK_NUM` to indicate which block should be programmed.

Before programming, make sure the eFuse programming voltage VDDQ is configured correctly as described in Section 4.3.4.

Programming BLOCK0

When `EFUSE_BLK_NUM` is set to 0, BLOCK0 will be programmed. Register `EFUSE_PGM_DATA0_REG` stores `EFUSE_WR_DIS`. Registers `EFUSE_PGM_DATA1_REG ~ EFUSE_PGM_DATA5_REG` store the information of parameters to be programmed. Note that 25 bits are readable but useless to users and must always be set to 0 in the programming registers. The specific bits are:

- `EFUSE_PGM_DATA1_REG[27:31]`
- `EFUSE_PGM_DATA1_REG[21:24]`
- `EFUSE_PGM_DATA2_REG[7:15]`
- `EFUSE_PGM_DATA2_REG[0:3]`
- `EFUSE_PGM_DATA3_REG[26:27]`
- `EFUSE_PGM_DATA4_REG[30]`

Data in registers `EFUSE_PGM_DATA6_REG ~ EFUSE_PGM_DATA7_REG` and `EFUSE_PGM_CHECK_VALUE0_REG ~ EFUSE_PGM_CHECK_VALUE2_REG` are ignored when programming BLOCK0.

Programming BLOCK1

When `EFUSE_BLK_NUM` is set to 1, registers `EFUSE_PGM_DATA0_REG ~ EFUSE_PGM_DATA5_REG` store the BLOCK1 parameters to be programmed. Registers `EFUSE_PGM_CHECK_VALUE0_REG ~ EFUSE_PGM_DATA2_REG` store the corresponding RS check codes. Data in registers `EFUSE_PGM_DATA6_REG ~ EFUSE_PGM_DATA7_REG` is ignored when programming BLOCK1, and the RS check codes will be calculated with these bits all treated as 0.

Programming BLOCK2 ~ 10

When `EFUSE_BLK_NUM` is set to 2 ~ 10, registers `EFUSE_PGM_DATA0_REG ~ EFUSE_PGM_DATA7_REG` store the parameters to be programmed to this block. Registers `EFUSE_PGM_CHECK_VALUE0_REG ~ EFUSE_PGM_CHECK_VALUE2_REG` store the corresponding RS check codes.

Programming process

The process of programming parameters is as follows:

1. Write the block number to `EFUSE_BLK_NUM` to determine the block to be programmed.
2. Write parameters to be programmed to registers `EFUSE_PGM_DATA0_REG ~ EFUSE_PGM_DATA7_REG` and the corresponding checksum values to `EFUSE_PGM_CHECK_VALUE0_REG ~ EFUSE_PGM_CHECK_VALUE2_REG`.
3. Configure the field `EFUSE_OP_CODE` of register `EFUSE_CONF_REG` to 0x5A5A.
4. Configure the field `EFUSE_PGM_CMD` of register `EFUSE_CMD_REG` to 1.
5. Poll register `EFUSE_CMD_REG` until it is 0x0, or wait for a PGM_DONE interrupt. For more information on how to identify a PGM_DONE interrupt, please see the end of Section 4.3.3.
6. In order to avoid programming content leakage, please clear the parameters in `EFUSE_PGM_DATA0_REG ~ EFUSE_PGM_DATA7_REG` and `EFUSE_PGM_CHECK_VALUE0_REG ~ EFUSE_PGM_CHECK_VALUE2_REG`.
7. Trigger an eFuse read operation (see Section 4.3.3) to update eFuse registers with the new values.

8. Check error record registers. If the values read in error record registers are not 0, the programming process should be performed again following above steps 1 ~ 7. Please check the following error record registers for different eFuse blocks:

- BLOCK0: [EFUSE_RD_REPEAT_ERR0_REG](#) ~ [EFUSE_RD_REPEAT_ERR4_REG](#)
- BLOCK1: [EFUSE_RD_RS_ERR0_REG](#)[2:0], [EFUSE_RD_RS_ERR0_REG](#)[7]
- BLOCK2: [EFUSE_RD_RS_ERR0_REG](#)[6:4], [EFUSE_RD_RS_ERR0_REG](#)[11]
- BLOCK3: [EFUSE_RD_RS_ERR0_REG](#)[10:8], [EFUSE_RD_RS_ERR0_REG](#)[15]
- BLOCK4: [EFUSE_RD_RS_ERR0_REG](#)[14:12], [EFUSE_RD_RS_ERR0_REG](#)[19]
- BLOCK5: [EFUSE_RD_RS_ERR0_REG](#)[18:16], [EFUSE_RD_RS_ERR0_REG](#)[23]
- BLOCK6: [EFUSE_RD_RS_ERR0_REG](#)[22:20], [EFUSE_RD_RS_ERR0_REG](#)[27]
- BLOCK7: [EFUSE_RD_RS_ERR0_REG](#)[26:24], [EFUSE_RD_RS_ERR0_REG](#)[31]
- BLOCK8: [EFUSE_RD_RS_ERR0_REG](#)[30:28], [EFUSE_RD_RS_ERR1_REG](#)[3]
- BLOCK9: [EFUSE_RD_RS_ERR1_REG](#)[2:0], [EFUSE_RD_RS_ERR1_REG](#)[2:0][7]
- BLOCK10: [EFUSE_RD_RS_ERR1_REG](#)[2:0][6:4]

Limitations

In BLOCK0, each bit can be programmed separately. However, we recommend to minimize programming cycles and program all the bits of a parameter in one programming action. In addition, after all parameters controlled by a certain bit of [EFUSE_WR_DIS](#) are programmed, that bit should be immediately programmed. The programming of parameters controlled by a certain bit of [EFUSE_WR_DIS](#), and the programming of the bit itself can even be completed at the same time. Repeated programming of already programmed bits is strictly forbidden, otherwise, programming errors will occur.

BLOCK1 cannot be programmed by users as it has been programmed at manufacturing.

BLOCK2 ~ 10 can only be programmed once. Repeated programming is not allowed.

4.3.3 User Read of Parameters

Users cannot read eFuse bits directly. The eFuse Controller hardware reads all eFuse bits and stores the results to their corresponding registers in its memory space. Then, users can read eFuse bits by reading the registers that start with [EFUSE_RD_](#). Details are provided in Table 4-4.

Table 4-4. Registers Information

BLOCK	Read Registers	Registers When Programming This Block
0	EFUSE_RD_WR_DIS_REG	EFUSE_PGM_DATA0_REG
0	EFUSE_RD_REPEAT_DATA0 ~ 4_REG	EFUSE_PGM_DATA1 ~ 5_REG
1	EFUSE_RD_MAC_SPI_SYS_0 ~ 5_REG	EFUSE_PGM_DATA0 ~ 5_REG
2	EFUSE_RD_SYS_PART1_0 ~ 7_REG	EFUSE_PGM_DATA0 ~ 7_REG
3	EFUSE_RD_USR_DATA0 ~ 7_REG	EFUSE_PGM_DATA0 ~ 7_REG
4 ~ 9	EFUSE_RD_KEY_n_DATA0 ~ 7_REG (<i>n</i> : 0 ~ 5)	EFUSE_PGM_DATA0 ~ 7_REG
10	EFUSE_RD_SYS_PART2_0 ~ 7_REG	EFUSE_PGM_DATA0 ~ 7_REG

Updating eFuse read registers

The eFuse Controller reads internal eFuses to update corresponding registers. This read operation happens on system reset and can also be triggered manually by users as needed (e.g., if new eFuse values have been programmed). The process of triggering a read operation by users is as follows:

1. Configure the field `EFUSE_OP_CODE` in register `EFUSE_CONF_REG` to 0x5AA5.
2. Configure the field `EFUSE_READ_CMD` in register `EFUSE_CMD_REG` to 1.
3. Poll register `EFUSE_CMD_REG` until it is 0x0, or wait for a `READ_DONE` interrupt. Information on how to identify a `READ_DONE` interrupt is provided below in this section.
4. users reads the values of each parameter from memory.

The eFuse read registers will hold all values until the next read operation.

Error detection

Error record registers allow users to detect if there are any inconsistencies in the stored backup eFuse parameters.

Registers `EFUSE_RD_REPEAT_ERR0 ~ 3_REG` indicate if there are any errors of programmed parameters (except for `EFUSE_WR_DIS`) in `BLOCK0` (value 1 indicates an error is detected, and the bit becomes invalid; value 0 indicates no error).

Registers `EFUSE_RD_RS_ERR0 ~ 1_REG` store the number of corrected bytes as well as the result of RS decoding during eFuse reading `BLOCK1 ~ BLOCK10`.

The values of above registers will be updated every time after the eFuse read registers have been updated.

Identifying the completion of a program/read operation

The methods to identify the completion of a program/read operation are described below. Please note that bit 1 corresponds to a program operation, and bit 0 corresponds to a read operation.

- Method one:
 1. Poll bit 1/0 in register `EFUSE_INT_RAW_REG` until it becomes 1, which represents the completion of a program/read operation.
- Method two:
 1. Set bit 1/0 in register `EFUSE_INT_ENA_REG` to 1 to enable the eFuse Controller to post a `PGM_DONE` or `READ_DONE` interrupt.
 2. Configure the Interrupt Matrix to enable the CPU to respond to eFuse interrupt signals, see Chapter 8 *Interrupt Matrix (INTERRUPT)*.
 3. Wait for the `PGM/READ_DONE` interrupt.
 4. Set bit 1/0 in register `EFUSE_INT_CLR_REG` to 1 to clear the `PGM/READ_DONE` interrupt.

Note

When eFuse controller updating its registers, it will use `EFUSE_PGM_DATAn_REG` (n=0 1 ..,7) again to store data. So please do not write important data into these registers before this updating process initiated.

During the chip boot process, eFuse controller will update eFuse data into registers which can be accessed by users automatically. You can get programmed eFuse data by reading corresponding registers. Thus, it is no need to update eFuse read registers in such case.

4.3.4 eFuse VDDQ Timing

The eFuse Controller operates with 20 MHz, one cycle is 50 ns, and its programming voltage VDDQ should be configured as follows:

- **EFUSE_DAC_NUM** (store the rising period of VDDQ): The default value of VDDQ is 2.5 V and the voltage increases by 0.01 V in each clock cycle. Thus, the default value of this parameter is 255;
- **EFUSE_DAC_CLK_DIV** (the clock divisor of VDDQ): The clock period to program VDDQ should be larger than 1 μ s;
- **EFUSE_PWR_ON_NUM** (the power-up time for VDDQ): The programming voltage should be stabilized after this time, which means the value of this parameter should be configured to exceed the value of **EFUSE_DAC_CLK_DIV** multiply by **EFUSE_DAC_NUM**;
- **EFUSE_PWR_OFF_NUM** (the power-out time for VDDQ): The value of this parameter should be larger than 10 μ s.

Table 4-5. Configuration of Default VDDQ Timing Parameters

EFUSE_DAC_NUM	EFUSE_DAC_CLK_DIV	EFUSE_PWR_ON_NUM	EFUSE_PWR_OFF_NUM
0xFF	0x28	0x3000	0x190

4.3.5 The Use of Parameters by Hardware Modules

Some hardware modules are directly connected to the eFuse peripheral in order to use the parameters listed in Table 4-1 and Table 4-3, specifically those marked with “Y” in columns “Accessible by Hardware”. Users cannot intervene in this process.

4.3.6 Interrupts

- **PGM_DONE** interrupt: Triggered when eFuse programming has finished. Set **EFUSE_PGM_DONE_INT_ENA** to enable this interrupt;
- **READ_DONE** interrupt: Triggered when eFuse reading has finished. Set **EFUSE_READ_DONE_INT_ENA** to enable this interrupt.

4.4 Register Summary

The addresses in this section are relative to eFuse Controller base address provided in Table 3-3 in Chapter 3 *System and Memory*.

07

Name	Description	Address	Access
PGM Data Register			
EFUSE_PGM_DATA0_REG	Register 0 that stores data to be programmed	0x0000	R/W
EFUSE_PGM_DATA1_REG	Register 1 that stores data to be programmed	0x0004	R/W
EFUSE_PGM_DATA2_REG	Register 2 that stores data to be programmed	0x0008	R/W
EFUSE_PGM_DATA3_REG	Register 3 that stores data to be programmed	0x000C	R/W
EFUSE_PGM_DATA4_REG	Register 4 that stores data to be programmed	0x0010	R/W
EFUSE_PGM_DATA5_REG	Register 5 that stores data to be programmed	0x0014	R/W
EFUSE_PGM_DATA6_REG	Register 6 that stores data to be programmed	0x0018	R/W
EFUSE_PGM_DATA7_REG	Register 7 that stores data to be programmed	0x001C	R/W
EFUSE_PGM_CHECK_VALUE0_REG	Register 0 that stores the RS code to be programmed	0x0020	R/W
EFUSE_PGM_CHECK_VALUE1_REG	Register 1 that stores the RS code to be programmed	0x0024	R/W
EFUSE_PGM_CHECK_VALUE2_REG	Register 2 that stores the RS code to be programmed	0x0028	R/W

EFUSE_DATE_REG	Version control register	0x01FC	R/W

4.5 Registers

The addresses in this section are relative to eFuse Controller base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 4.1. EFUSE_PGM_DATA0_REG (0x0000)

EFUSE_PGM_DATA_0 The content of the 0th 32-bit data to be programmed. (R/W)

Register 4.2. EFUSE_PGM_DATA1_REG (0x0004)

EFUSE_PGM_DATA_1 The content of the first 32-bit data to be programmed. (R/W)

Register 4.3. EFUSE_PGM_DATA2_REG (0x0008)

EFUSE_PGM_DATA_2 The content of the second 32-bit data to be programmed. (R/W)

Register 4.4. EFUSE_PGM_DATA3_REG (0x000C)

EFUSE_PGM_DATA_3 The content of the 3rd 32-bit data to be programmed. (R/W)

Register 4.5. EFUSE_PGM_DATA4_REG (0x0010)

EFUSE_PGM_DATA_4 The content of the 4th 32-bit data to be programmed. (R/W)

Register 4.6. EFUSE_PGM_DATA5_REG (0x0014)

EFUSE_PGM_DATA_5 The content of the 5th 32-bit data to be programmed. (R/W)

Register 4.7. EFUSE_PGM_DATA6_REG (0x0018)

EFUSE_PGM_DATA_6 The content of the 6th 32-bit data to be programmed. (R/W)

Register 4.8. EFUSE_PGM_DATA7_REG (0x001C)

EFUSE_PGM_DATA_7 The content of the 7th 32-bit data to be programmed. (R/W)

Register 4.9. EFUSE_PGM_CHECK_VALUE0_REG (0x0020)

EFUSE_PGM_RS_DATA_0 The content of the 0th 32-bit RS code to be programmed. (R/W)

Register 4.10. EFUSE_PGM_CHECK_VALUE1_REG (0x0024)

EFUSE_PGM_RS_DATA_1 The content of the first 32-bit RS code to be programmed. (R/W)

Register 4.11. EFUSE_PGM_CHECK_VALUE2_REG (0x0028)

EFUSE_PGM_RS_DATA_2 The content of the second 32-bit RS code to be programmed. (R/W)

Register 4.12. EFUSE_RD_WR_DIS_REG (0x002C)

EFUSE_WR_DIS Disable programming of individual eFuses. (RO)

Register 4.13. EFUSE_RD_REPEAT_DATA0_REG (0x0030)

31	27	26	25	24	21	20	19	18	16	15	14	13	12	11	10	9	8	7	6	0	
0	0	0	0	0	0	0	0	0	0x0	0	0	0	0	0	0	0	0	0	0	0x0	Reset

EFUSE_RD_DIS This bit be set to disable users reading from BLOCK4 ~ 10. (RO)

EFUSE_RPT4_RESERVED3 Reserved (used four backups method). (RO)

EFUSE_DIS_ICACHE This bit be set to disable lcache. (RO)

EFUSE_DIS_DCACHE This bit be set to disable Dcache. (RO)

EFUSE_DIS_DOWNLOAD_ICACHE This bit be set to disable lcache in download mode (boot_mode[3:0] is 0, 1, 2, 3, 6, 7). (RO)

EFUSE_DIS_DOWNLOAD_DCACHE This bit be set to disable Dcache in download mode (boot_mode[3:0] is 0, 1, 2, 3, 6, 7). (RO)

EFUSE_DIS_FORCE_DOWNLOAD This bit be set to disable the function that forces chip into download mode. (RO)

EFUSE_DIS_USB_OTG This bit be set to disable USB OTG function. (RO)

EFUSE_DIS_TWAI This bit be set to disable TWAI function. (RO)

EFUSE_DIS_APP_CPU This bit be set to disable app cpu. (RO)

EFUSE_SOFT_DIS_JTAG These bits be set (odd number of bits set to 1 means disable) to disable JTAG with soft-disable method so that users can re-enable JTAG by HMAC module again. (RO)

EFUSE_DIS_PAD_JTAG This bit be set to disable JTAG permanently. (RO)

EFUSE_DIS_DOWNLOAD_MANUAL_ENCRYPT This bit be set to disable flash encryption when in download boot modes. (RO)

EFUSE_USB_EXCHG_PINS This bit be set to swap USB D+ and D- pins. (RO)

Note: The eFuse has a design flaw and does **not** move the pullup (needed to detect USB speed), resulting in the PC thinking the chip is a low-speed device, which stops communication. For detailed information, please refer to Chapter 29 [USB Serial/JTAG Controller \(USB_SERIAL_JTAG\)](#).

EFUSE_EXT_PHY_ENABLE This bit be set to enable external PHY. (RO)

Register 4.14. EFUSE_RD_REPEAT_DATA1_REG (0x0034)

EFUSE_KEY_PURPOSE_1		EFUSE_KEY_PURPOSE_0		EFUSE_SECURE_BOOT_KEY_REVOKE2		EFUSE_SECURE_BOOT_KEY_REVOKE1		EFUSE_SECURE_BOOT_KEY_REVOKE0		EFUSE_SPI_BOOT_CRYPT_CNT		EFUSE_WDT_DELAY_SEL		(reserved)		EFUSE_VDD_SPI_FORCE		EFUSE_VDD_SPI_TIEH		EFUSE_VDD_SPI_XPD		(reserved)	
31	28	27	24	23	22	21	20	18	17	16	15					7	6	5	4	3			0
0x0		0x0		0	0	0	0x0		0x0		0	0	0	0	0	0	0	0	0	0	0	0	0

Reset

EFUSE_VDD_SPI_XPD This bit be set to means SPI regulator power up. (RO)

EFUSE_VDD_SPI_TIEH SPI regulator output is short connected to VDD3P3_RTC_IO. (RO)

EFUSE_VDD_SPI_FORCE This bit be set to force using the parameters in eFuse to configure VDD_SPI. (RO)

EFUSE_WDT_DELAY_SEL Selects RTC watchdog timeout threshold, in unit of slow clock cycle. 00: 40000, 01: 80000, 10: 160000, 11:320000. (RO)

EFUSE_SPI_BOOT_CRYPT_CNT This bit be set to enable SPI boot encrypt/decrypt. Odd number of 1: enable. even number of 1: disable. (RO)

EFUSE_SECURE_BOOT_KEY_REVOKE0 This bit be set to revoke first secure boot key. (RO)

EFUSE_SECURE_BOOT_KEY_REVOKE1 This bit be set to revoke second secure boot key. (RO)

EFUSE_SECURE_BOOT_KEY_REVOKE2 This bit be set to revoke third secure boot key. (RO)

EFUSE_KEY_PURPOSE_0 Purpose of Key0. (RO)

EFUSE_KEY_PURPOSE_1 Purpose of Key1. (RO)

Register 4.15. EFUSE_RD_REPEAT_DATA2_REG (0x0038)

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	4	3	0
0x0	0x0	0	0	0	0	0	0	0	0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0

Reset

EFUSE_KEY_PURPOSE_2 Purpose of Key2. (RO)

EFUSE_KEY_PURPOSE_3 Purpose of Key3. (RO)

EFUSE_KEY_PURPOSE_4 Purpose of Key4. (RO)

EFUSE_KEY_PURPOSE_5 Purpose of Key5. (RO)

EFUSE_RPT4_RESERVED0 Reserved (used four backups method). (RO)

EFUSE_SECURE_BOOT_EN This bit be set to enable secure boot. (RO)

EFUSE_SECURE_BOOT_AGGRESSIVE_REVOKE This bit be set to enable aggressive revoke of secure boot keys. (RO)

EFUSE_DIS_USB_JTAG This bit be set to disable USB OTG function that can be switched to JTAG interface. (RO)

EFUSE_DIS_USB_SERIAL_JTAG This bit be set to disable usb_serial_jtag function. (RO)

EFUSE_STRAP_JTAG_SEL This bit be set to enable selection between usb_to_jtag and pad_to_jtag through strapping GPIO3 when both reg_dis_usb_jtag and reg_dis_pad_jtag are equal to 0. (RO)

EFUSE_USB_PHY_SEL This bit is used to switch internal PHY and external PHY for USB OTG and USB Serial/JTAG. 0: internal PHY is assigned to USB Serial/JTAG while external PHY is assigned to USB OTG. 1: internal PHY is assigned to USB OTG while external PHY is assigned to USB Serial/JTAG. (RO)

EFUSE_FLASH_TPUW Configures flash waiting time after power-up, in unit of ms. If the value is less than 15, the waiting time is the configurable value. Otherwise, the waiting time is twice the configurable value. (RO)

Register 4.16. EFUSE_RD_REPEAT_DATA3_REG (0x003C)

31	30	29	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
0	0		0x00	0	0	0x0	0	0	0x0	0	0	0	0	0	0	0	0	Reset

EFUSE_DIS_DOWNLOAD_MODE This bit be set to disable download mode (boot_mode[3:0] = 0, 1, 2, 3, 6, 7). (RO)

EFUSE_DIS_LEGACY_SPI_BOOT This bit be set to disable Legacy SPI boot mode (boot_mode[3:0] = 4). (RO)

EFUSE_UART_PRINT_CHANNEL This bit be set to select the default UART print channel. 0: UART0. 1: UART1. (RO)

EFUSE_FLASH_ECC_MODE This bit be set to enable ECC mode in ROM, 0: Enable Flash ECC 16-to-18 byte mode in ROM. 1: Use 16-to-17 byte mode in ROM. (RO)

EFUSE_DIS_USB_DOWNLOAD_MODE This bit be set to disable UART download mode through USB. (RO)

EFUSE_ENABLE_SECURITY_DOWNLOAD This bit be set to enable secure UART download mode. (RO)

EFUSE_UART_PRINT_CONTROL This bit be set for the default UART boot message output mode. 00: Enabled. 01: Enabled when GPIO46 is low at reset. 10: Enabled when GPIO46 is high at reset. 11: disabled. (RO)

EFUSE_PIN_POWER_SELECTION GPIO33 ~ GPIO37 power supply selection while ROM code is executed. 0: VDD3P3_CPU. 1: VDD_SPI. (RO)

EFUSE_FLASH_TYPE Set the maximum data lines of SPI flash. 0: four lines. 1: eight lines. (RO)

EFUSE_FLASH_PAGE_SIZE Set Flash page size, 0: 256 Byte; 1: 512 Byte; 2: 1 KB; 3: 2 KB. (RO)

EFUSE_FLASH_ECC_EN This bit be set to enable ECC for flash boot. (RO)

EFUSE_FORCE_SEND_RESUME This bit be set to force ROM code to send a resume command during SPI boot. (RO)

EFUSE_SECURE_VERSION Secure version (used by ESP-IDF anti-rollback feature). (RO)

EFUSE_ERR_RST_ENABLE 1: use BLOCK0 to check error record registers; 0: disable such check. (RO)

Register 4.17. EFUSE_RD_REPEAT_DATA4_REG (0x0040)

(reserved)								EFUSE_RPT4_RESERVED2																									
31								24																	23								0
0 0 0 0 0 0 0 0								0x0000																									
Reset																																	

EFUSE_RPT4_RESERVED2 Reserved (used for four backups method). (RO)

Register 4.18. EFUSE_RD_MAC_SPI_SYS_0_REG (0x0044)

EFUSE_MAC_0																															
31																															0
0x000000																															
Reset																															

EFUSE_MAC_0 Stores the low 32 bits of MAC address. (RO)

Register 4.19. EFUSE_RD_MAC_SPI_SYS_1_REG (0x0048)

EFUSE_SPI_PAD_CONF_0																EFUSE_MAC_1																
31															16	15																0
0x00																0x00																
Reset																																

EFUSE_MAC_1 Stores the high 16 bits of MAC address. (RO)

EFUSE_SPI_PAD_CONF_0 Stores the first part of SPI_PAD_CONF. (RO)

Register 4.20. EFUSE_RD_MAC_SPI_SYS_2_REG (0x004C)

EFUSE_SPI_PAD_CONF_1 Stores the second part of SPI_PAD_CONF. (RO)

Register 4.21. EFUSE_RD_MAC_SPI_SYS_3_REG (0x0050)

EFUSE_SPI_PAD_CONF_2 Stores the second part of SPI_PAD_CONF. (RO)

EFUSE_WAFER_VERSION Stores wafer version information. (RO)

EFUSE_PKG_VERSION Stores package version information. (RO)

EFUSE_SYS_DATA_PART0_0 Stores the bits 0~7 of the first part of system data. (RO)

Register 4.22. EFUSE_RD_MAC_SPI_SYS_4_REG (0x0054)

EFUSE_SYS_DATA_PART0_1 Stores the bits 8~39 of the first part of system data. (RO)

Register 4.23. EFUSE_RD_MAC_SPI_SYS_5_REG (0x0058)

EFUSE_SYS_DATA_PART0_2 Stores the bits 40~71 of the first part of system data. (RO)

Register 4.24. EFUSE_RD_SYS_PART1_DATA0_REG (0x005C)

EFUSE_OPTIONAL_UNIQUE_ID_0 Stores the bits 0~31 of the optional unique id information. (RO)

Register 4.25. EFUSE_RD_SYS_PART1_DATA1_REG (0x0060)

EFUSE_OPTIONAL_UNIQUE_ID_1 Stores the bits 32~63 of the optional unique id information. (RO)

Register 4.26. EFUSE_RD_SYS_PART1_DATA2_REG (0x0064)

EFUSE_OPTIONAL_UNIQUE_ID_2 Stores the bits 64~95 of the optional unique id information. (RO)

Register 4.27. EFUSE_RD_SYS_PART1_DATA3_REG (0x0068)

EFUSE_OPTIONAL_UNIQUE_ID_3 Stores the bits 96~127 of the optional unique id information. (RO)

Register 4.28. EFUSE_RD_SYS_PART1_DATA4_REG (0x006C)

EFUSE_SYS_DATA_PART1_0 Stores the first 32 bits of the second part of system data. (RO)

Register 4.29. EFUSE_RD_SYS_PART1_DATA5_REG (0x0070)

EFUSE_SYS_DATA_PART1_1 Stores the second 32 bits of the second part of system data. (RO)

Register 4.30. EFUSE_RD_SYS_PART1_DATA6_REG (0x0074)

EFUSE_SYS_DATA_PART1_2 Stores the third 32 bits of the second part of system data. (RO)

Register 4.31. EFUSE_RD_SYS_PART1_DATA7_REG (0x0078)

EFUSE_SYS_DATA_PART1_3 Stores the fourth 32 bits of the second part of system data. (RO)

Register 4.32. EFUSE_RD_USR_DATA0_REG (0x007C)

EFUSE_USR_DATA0 Stores the bits [0:31] of BLOCK3 (user). (RO)

Register 4.33. EFUSE_RD_USR_DATA1_REG (0x0080)

EFUSE_USR_DATA1 Stores the bits [32:63] of BLOCK3 (user). (RO)

Register 4.34. EFUSE_RD_USR_DATA2_REG (0x0084)

EFUSE_USR_DATA2 Stores the bits [64:95] of BLOCK3 (user). (RO)

Register 4.35. EFUSE_RD_USR_DATA3_REG (0x0088)

EFUSE_USR_DATA3 Stores the bits [96:127] of BLOCK3 (user). (RO)

Register 4.36. EFUSE_RD_USR_DATA4_REG (0x008C)

EFUSE_USR_DATA4 Stores the bits [128:159] of BLOCK3 (user). (RO)

Register 4.37. EFUSE_RD_USR_DATA5_REG (0x0090)

EFUSE_USR_DATA5 Stores the bits [160:191] of BLOCK3 (user). (RO)

Register 4.38. EFUSE_RD_USR_DATA6_REG (0x0094)

EFUSE_USR_DATA6 Stores the bits [192:223] of BLOCK3 (user). (RO)

Register 4.39. EFUSE_RD_USR_DATA7_REG (0x0098)

EFUSE_USR_DATA7 Stores the bits [224:255] of BLOCK3 (user). (RO)

Register 4.40. EFUSE_RD_KEY0_DATA0_REG (0x009C)

EFUSE_KEY0_DATA0 Stores the first 32 bits of KEY0. (RO)

Register 4.41. EFUSE_RD_KEY0_DATA1_REG (0x00A0)

EFUSE_KEY0_DATA1 Stores the second 32 bits of KEY0. (RO)

Register 4.42. EFUSE_RD_KEY0_DATA2_REG (0x00A4)

EFUSE_KEY0_DATA2 Stores the third 32 bits of KEY0. (RO)

Register 4.43. EFUSE_RD_KEY0_DATA3_REG (0x00A8)

EFUSE_KEY0_DATA3 Stores the fourth 32 bits of KEY0. (RO)

Register 4.44. EFUSE_RD_KEY0_DATA4_REG (0x00AC)

EFUSE_KEY0_DATA4 Stores the fifth 32 bits of KEY0. (RO)

Register 4.45. EFUSE_RD_KEY0_DATA5_REG (0x00B0)

EFUSE_KEY0_DATA5 Stores the sixth 32 bits of KEY0. (RO)

Register 4.46. EFUSE_RD_KEY0_DATA6_REG (0x00B4)

EFUSE_KEY0_DATA6 Stores the seventh 32 bits of KEY0. (RO)

Register 4.47. EFUSE_RD_KEY0_DATA7_REG (0x00B8)

EFUSE_KEY0_DATA7 Stores the eighth 32 bits of KEY0. (RO)

Register 4.48. EFUSE_RD_KEY1_DATA0_REG (0x00BC)

EFUSE_KEY1_DATA0 Stores the first 32 bits of KEY1. (RO)

Register 4.49. EFUSE_RD_KEY1_DATA1_REG (0x00C0)

EFUSE_KEY1_DATA1 Stores the second 32 bits of KEY1. (RO)

Register 4.50. EFUSE_RD_KEY1_DATA2_REG (0x00C4)

EFUSE_KEY1_DATA2 Stores the third 32 bits of KEY1. (RO)

Register 4.51. EFUSE_RD_KEY1_DATA3_REG (0x00C8)

EFUSE_KEY1_DATA3 Stores the fourth 32 bits of KEY1. (RO)

Register 4.52. EFUSE_RD_KEY1_DATA4_REG (0x00CC)

EFUSE_KEY1_DATA4 Stores the fifth 32 bits of KEY1. (RO)

Register 4.53. EFUSE_RD_KEY1_DATA5_REG (0x00D0)

EFUSE_KEY1_DATA5 Stores the sixth 32 bits of KEY1. (RO)

Register 4.54. EFUSE_RD_KEY1_DATA6_REG (0x00D4)

EFUSE_KEY1_DATA6 Stores the seventh 32 bits of KEY1. (RO)

Register 4.55. EFUSE_RD_KEY1_DATA7_REG (0x00D8)

EFUSE_KEY1_DATA7 Stores the eighth 32 bits of KEY1. (RO)

Register 4.56. EFUSE_RD_KEY2_DATA0_REG (0x00DC)

EFUSE_KEY2_DATA0 Stores the first 32 bits of KEY2. (RO)

Register 4.57. EFUSE_RD_KEY2_DATA1_REG (0x00E0)

EFUSE_KEY2_DATA1 Stores the second 32 bits of KEY2. (RO)

Register 4.58. EFUSE_RD_KEY2_DATA2_REG (0x00E4)

EFUSE_KEY2_DATA2 Stores the third 32 bits of KEY2. (RO)

Register 4.59. EFUSE_RD_KEY2_DATA3_REG (0x00E8)

EFUSE_KEY2_DATA3 Stores the fourth 32 bits of KEY2. (RO)

Register 4.60. EFUSE_RD_KEY2_DATA4_REG (0x00EC)

EFUSE_KEY2_DATA4 Stores the fifth 32 bits of KEY2. (RO)

Register 4.61. EFUSE_RD_KEY2_DATA5_REG (0x00F0)

EFUSE_KEY2_DATA5 Stores the sixth 32 bits of KEY2. (RO)

Register 4.62. EFUSE_RD_KEY2_DATA6_REG (0x00F4)

EFUSE_KEY2_DATA6 Stores the seventh 32 bits of KEY2. (RO)

Register 4.63. EFUSE_RD_KEY2_DATA7_REG (0x00F8)

EFUSE_KEY2_DATA7 Stores the eighth 32 bits of KEY2. (RO)

Register 4.64. EFUSE_RD_KEY3_DATA0_REG (0x00FC)

EFUSE_KEY3_DATA0 Stores the first 32 bits of KEY3. (RO)

Register 4.65. EFUSE_RD_KEY3_DATA1_REG (0x0100)

EFUSE_KEY3_DATA1 Stores the second 32 bits of KEY3. (RO)

Register 4.66. EFUSE_RD_KEY3_DATA2_REG (0x0104)

EFUSE_KEY3_DATA2 Stores the third 32 bits of KEY3. (RO)

Register 4.67. EFUSE_RD_KEY3_DATA3_REG (0x0108)

EFUSE_KEY3_DATA3 Stores the fourth 32 bits of KEY3. (RO)

Register 4.68. EFUSE_RD_KEY3_DATA4_REG (0x010C)

EFUSE_KEY3_DATA4 Stores the fifth 32 bits of KEY3. (RO)

Register 4.69. EFUSE_RD_KEY3_DATA5_REG (0x0110)

EFUSE_KEY3_DATA5 Stores the sixth 32 bits of KEY3. (RO)

Register 4.70. EFUSE_RD_KEY3_DATA6_REG (0x0114)

EFUSE_KEY3_DATA6 Stores the seventh 32 bits of KEY3. (RO)

Register 4.71. EFUSE_RD_KEY3_DATA7_REG (0x0118)

EFUSE_KEY3_DATA7 Stores the eighth 32 bits of KEY3. (RO)

Register 4.72. EFUSE_RD_KEY4_DATA0_REG (0x011C)

EFUSE_KEY4_DATA0 Stores the first 32 bits of KEY4. (RO)

Register 4.73. EFUSE_RD_KEY4_DATA1_REG (0x0120)

EFUSE_KEY4_DATA1 Stores the second 32 bits of KEY4. (RO)

Register 4.74. EFUSE_RD_KEY4_DATA2_REG (0x0124)

EFUSE_KEY4_DATA2 Stores the third 32 bits of KEY4. (RO)

Register 4.75. EFUSE_RD_KEY4_DATA3_REG (0x0128)

EFUSE_KEY4_DATA3 Stores the fourth 32 bits of KEY4. (RO)

Register 4.76. EFUSE_RD_KEY4_DATA4_REG (0x012C)

EFUSE_KEY4_DATA4 Stores the fifth 32 bits of KEY4. (RO)

Register 4.77. EFUSE_RD_KEY4_DATA5_REG (0x0130)

EFUSE_KEY4_DATA5 Stores the sixth 32 bits of KEY4. (RO)

Register 4.78. EFUSE_RD_KEY4_DATA6_REG (0x0134)

EFUSE_KEY4_DATA6 Stores the seventh 32 bits of KEY4. (RO)

Register 4.79. EFUSE_RD_KEY4_DATA7_REG (0x0138)

EFUSE_KEY4_DATA7 Stores the eighth 32 bits of KEY4. (RO)

Register 4.80. EFUSE_RD_KEY5_DATA0_REG (0x013C)

EFUSE_KEY5_DATA0 Stores the first 32 bits of KEY5. (RO)

Register 4.81. EFUSE_RD_KEY5_DATA1_REG (0x0140)

EFUSE_KEY5_DATA1 Stores the second 32 bits of KEY5. (RO)

Register 4.82. EFUSE_RD_KEY5_DATA2_REG (0x0144)

EFUSE_KEY5_DATA2 Stores the third 32 bits of KEY5. (RO)

Register 4.83. EFUSE_RD_KEY5_DATA3_REG (0x0148)

EFUSE_KEY5_DATA3 Stores the fourth 32 bits of KEY5. (RO)

Register 4.84. EFUSE_RD_KEY5_DATA4_REG (0x014C)

EFUSE_KEY5_DATA4 Stores the fifth 32 bits of KEY5. (RO)

Register 4.85. EFUSE_RD_KEY5_DATA5_REG (0x0150)

EFUSE_KEY5_DATA5 Stores the sixth 32 bits of KEY5. (RO)

Register 4.86. EFUSE_RD_KEY5_DATA6_REG (0x0154)

EFUSE_KEY5_DATA6 Stores the seventh 32 bits of KEY5. (RO)

Register 4.87. EFUSE_RD_KEY5_DATA7_REG (0x0158)

EFUSE_KEY5_DATA7 Stores the eighth 32 bits of KEY5. (RO)

Register 4.88. EFUSE_RD_SYS_PART2_DATA0_REG (0x015C)

EFUSE_SYS_DATA_PART2_0 Stores the first 32 bits of the third part of system data. (RO)

Register 4.89. EFUSE_RD_SYS_PART2_DATA1_REG (0x0160)

EFUSE_SYS_DATA_PART2_1 Stores the second 32 bits of the third part of system data. (RO)

Register 4.90. EFUSE_RD_SYS_PART2_DATA2_REG (0x0164)

EFUSE_SYS_DATA_PART2_2 Stores the third 32 bits of the third part of system data. (RO)

Register 4.91. EFUSE_RD_SYS_PART2_DATA3_REG (0x0168)

EFUSE_SYS_DATA_PART2_3 Stores the fourth 32 bits of the third part of system data. (RO)

Register 4.92. EFUSE_RD_SYS_PART2_DATA4_REG (0x016C)

EFUSE_SYS_DATA_PART2_4 Stores the fifth 32 bits of the third part of system data. (RO)

Register 4.93. EFUSE_RD_SYS_PART2_DATA5_REG (0x0170)

EFUSE_SYS_DATA_PART2_5 Stores the sixth 32 bits of the third part of system data. (RO)

Register 4.94. EFUSE_RD_SYS_PART2_DATA6_REG (0x0174)

EFUSE_SYS_DATA_PART2_6 Stores the seventh 32 bits of the third part of system data. (RO)

Register 4.95. EFUSE_RD_SYS_PART2_DATA7_REG (0x0178)

EFUSE_SYS_DATA_PART2_7 Stores the eighth 32 bits of the third part of system data. (RO)

Register 4.96. EFUSE_RD_REPEAT_ERR0_REG (0x017C)

(reserved)				EFUSE_EXT_PHY_ENABLE_ERR EFUSE_USB_EXCHG_PINS_ERR				(reserved)				EFUSE_DIS_DOWNLOAD_MANUAL_ENCRYPT_ERR EFUSE_DIS_PAD_JTAG_ERR				EFUSE_SOFT_DIS_JTAG_ERR				EFUSE_DIS_APP_CPU_ERR EFUSE_DIS_TWAI_ERR EFUSE_DIS_USB_ERR EFUSE_DIS_FORCE_OTG_ERR EFUSE_DIS_DOWNLOAD_DOWNLOAD_ERR EFUSE_DIS_DOWNLOAD_DCACHE_ERR EFUSE_DIS_ICACHE_ERR EFUSE_DIS_RTC_RAM_BOOT_ERR				EFUSE_RD_DIS_ERR

5 IO MUX and GPIO Matrix (GPIO, IO MUX)

5.1 Overview

The ESP32-S3 chip features 45 physical GPIO pins. Each pin can be used as a general-purpose I/O, or be connected to an internal peripheral signal. Through GPIO matrix, IO MUX, and RTC IO MUX, peripheral input signals can be from any GPIO pin, and peripheral output signals can be routed to any GPIO pin. Together these modules provide highly configurable I/O.

Note that the 45 GPIO pins are numbered from 0 ~ 21 and 26 ~ 48. All these pins can be configured either as input or output.

5.2 Features

GPIO Matrix Features

- A full-switching matrix between the peripheral input/output signals and the GPIO pins.
- 175 digital peripheral input signals can be sourced from the input of any GPIO pins.
- The output of any GPIO pins can be from any of the 184 digital peripheral output signals.
- Supports signal synchronization for peripheral inputs based on APB clock bus.
- Provides input signal filter.
- Supports sigma delta modulated output.
- Supports GPIO simple input and output.

IO MUX Features

- Provides one configuration register `IO_MUX_GPIO n _REG` for each GPIO pin. The pin can be configured to
 - perform GPIO function routed by GPIO matrix;
 - or perform direct connection bypassing GPIO matrix.
- Supports some high-speed digital signals (SPI, JTAG, UART) bypassing GPIO matrix for better high-frequency digital performance. In this case, IO MUX is used to connect these pins directly to peripherals.

RTC IO MUX Features

- Controls low power feature of 22 RTC GPIO pins.
- Controls analog functions of 22 RTC GPIO pins.
- Redirects 22 RTC input/output signals to RTC system.

5.3 Architectural Overview

Figure 5-1 shows in details how IO MUX, RTC IO MUX, and GPIO matrix route signals from pins to peripherals, and from peripherals to pins.

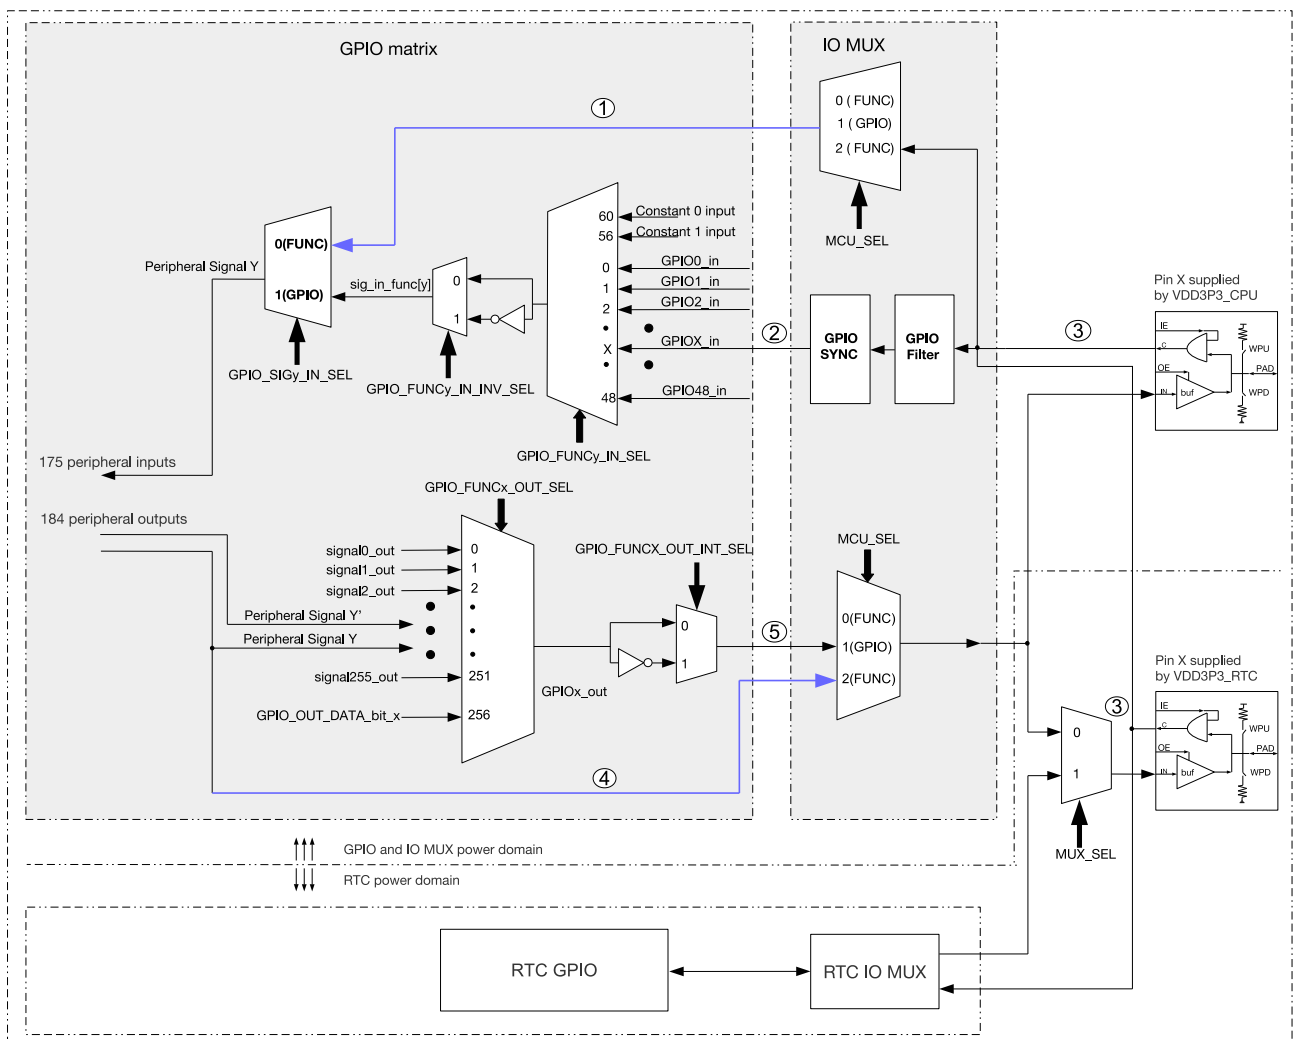

Figure 5-1. Architecture of IO MUX, RTC IO MUX, and GPIO Matrix

1. Only part of peripheral input signals (marked “yes” in column “Direct input through IO MUX” in Table 5-2) can bypass GPIO matrix. The other input signals can only be routed to peripherals via GPIO matrix.
2. There are only 45 inputs from GPIO SYNC to GPIO matrix, since ESP32-S3 provides 45 GPIO pins in total.
3. The pins supplied by VDD3P3_CPU or by VDD3P3_RTC are controlled by the signals: IE, OE, WPU, and WPD.
4. Only part of peripheral outputs (marked “yes” in column “Direct output through IO MUX” in Table 5-2) can be routed to pins bypassing GPIO matrix.
5. There are only 45 outputs (GPIO pin X: 0 ~ 21, 26 ~ 48) from GPIO matrix to IO MUX.

Figure 5-2 shows the internal structure of a pad, which is an electrical interface between the chip logic and the GPIO pin. The structure is applicable to all 45 GPIO pins and can be controlled using IE, OE, WPU, and WPD signals.

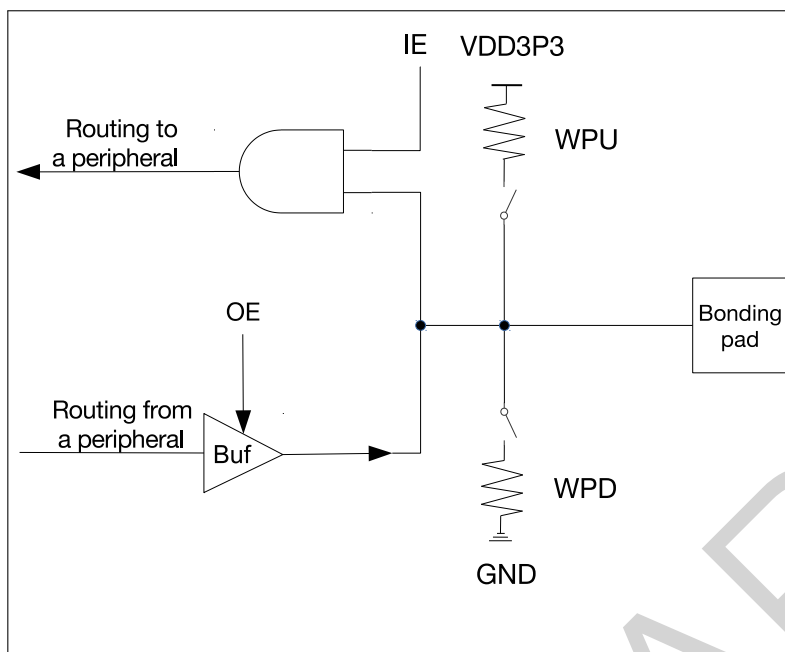

Figure 5-2. Internal Structure of a Pad

Note:

- IE: input enable
- OE: output enable
- WPU: internal weak pull-up
- WPD: internal weak pull-down
- Bonding pad: a terminal point of the chip logic used to make a physical connection from the chip die to GPIO pin in the chip package.

5.4 Peripheral Input via GPIO Matrix

5.4.1 Overview

To receive a peripheral input signal via GPIO matrix, the matrix is configured to source the peripheral input signal from one of the 45 GPIOs (0 ~ 21, 26 ~ 48), see Table 5-2. Meanwhile, register corresponding to the peripheral signal should be set to receive input signal via GPIO matrix.

5.4.2 Signal Synchronization

When signals are directed from pins using the GPIO matrix, the signals will be synchronized to the APB bus clock by the GPIO SYNC hardware, then go to GPIO matrix. This synchronization applies to all GPIO matrix signals but does not apply when using the IO MUX, see Figure 5-1.

Figure 5-3. GPIO Input Synchronized on APB Clock Rising Edge or on Falling Edge

Figure 5-3 shows the functionality of GPIO SYNC. In the figure, negative sync and positive sync mean GPIO input is synchronized on APB clock falling edge and on APB clock rising edge, respectively.

5.4.3 Functional Description

To read GPIO pin X^1 into peripheral signal Y , follow the steps below:

1. Configure register `GPIO_FUNC y _IN_SEL_CFG_REG` corresponding to peripheral signal Y in GPIO matrix:
 - Set `GPIO_SIG y _IN_SEL` to enable peripheral signal input via GPIO matrix.
 - Set `GPIO_FUNC y _IN_SEL` to the desired GPIO pin, i.e. X here.

Note that some peripheral signals have no valid `GPIO_SIG y _IN_SEL` bit, namely, these peripherals can only receive input signals via GPIO matrix.

2. Optionally enable the filter for pin input signals by setting the register `IO_MUX_FILTER_EN`. Only the signals with a valid width of more than two APB clock cycles can be sampled, see Figure 5-4.

Figure 5-4. Filter Timing of GPIO Input Signals

3. Synchronize GPIO input. To do so, please set `GPIO_PIN x _REG` corresponding to GPIO pin X as follows:
 - Set `GPIO_PIN x _SYNC1_BYPASS` to enable input signal synchronized on rising edge or on falling edge in the first clock, see Figure 5-3.

- Set `GPIO_PIN x _SYNC2_BYPASS` to enable input signal synchronized on rising edge or on falling edge in the second clock, see Figure 5-3.
4. Configure IO MUX register to enable pin input. For this end, please set `IO_MUX_X_REG` corresponding to GPIO pin x as follows:
 - Set `IO_MUX_FUN_IE` to enable input².
 - Set or clear `IO_MUX_FUN_WPU` and `IO_MUX_FUN_WPD`, as desired, to enable or disable pull-up and pull-down resistors.

For example, to connect RMT channel 0 input signal³ (`rmt_sig_in0`, signal index 81) to GPIO40, please follow the steps below. Note that GPIO40 is also named as MTDO pin.

1. Set `GPIO_SIG81_IN_SEL` in register `GPIO_FUNC81_IN_SEL_CFG_REG` to enable peripheral signal input via GPIO matrix.
2. Set `GPIO_FUNC81_IN_SEL` in register `GPIO_FUNC81_IN_SEL_CFG_REG` to 40, i.e. select GPIO40.
3. Set `IO_MUX_FUN_IE` in register `IO_MUX_GPIO40_REG` to enable pin input.

Note:

1. One pin input can be connected to multiple peripheral input signals.
2. The input signal can be inverted by configuring `GPIO_FUNC y _IN_INV_SEL`.
3. It is possible to have a peripheral read a constantly low or constantly high input value without connecting this input to a pin. This can be done by selecting a special `GPIO_FUNC y _IN_SEL` input, instead of a GPIO number:
 - When `GPIO_FUNC y _IN_SEL` is set to 0x3C, input signal is always 0.
 - When `GPIO_FUNC y _IN_SEL` is set to 0x38, input signal is always 1.

5.4.4 Simple GPIO Input

`GPIO_IN_REG`/`GPIO_IN1_REG` holds the input values of each GPIO pin. The input value of any GPIO pin can be read at any time without configuring GPIO matrix for a particular peripheral signal. However, it is necessary to enable pin input by setting `IO_MUX_FUN_IE` in register `IO_MUX_x_REG` corresponding to pin X , as described in Section 5.4.2.

5.5 Peripheral Output via GPIO Matrix

5.5.1 Overview

To output a signal from a peripheral via GPIO matrix, the matrix is configured to route peripheral output signals (only signals with a name assigned in the column "Output signal" in Table 5-2) to one of the 45 GPIOs (0 ~ 21, 26 ~ 48).

The output signal is routed from the peripheral into GPIO matrix and then into IO MUX. IO MUX must be configured to set the chosen pin to GPIO function. This enables the output GPIO signal to be connected to the pin.

Note:

There is a range of peripheral output signals (208 ~ 212 in Table 5-2) which are not connected to any peripheral, but to the

input signals (208 ~ 212) directly. These can be used to input a signal from one GPIO pin and output directly to another GPIO pin.

5.5.2 Functional Description

Some of the 256 output signals (signals with a name assigned in the column "Output signal" in Table 5-2) can be set to go through GPIO matrix into IO MUX and then to a pin. Figure 5-1 illustrates the configuration.

To output peripheral signal Y to a particular GPIO pin $X^1, 2$, follow these steps:

1. Configure `GPIO_FUNC x _OUT_SEL_CFG_REG` and `GPIO_ENABLE_REG $[x]$` corresponding to GPIO pin X in GPIO matrix. Recommended operation: use corresponding `W1TS` (write 1 to set) and `W1TC` (write 1 to clear) registers to set or clear `GPIO_ENABLE_REG`.
 - Set the `GPIO_FUNC x _OUT_SEL` field in register `GPIO_FUNC x _OUT_SEL_CFG_REG` to the index of the desired peripheral output signal Y .
 - If the signal should always be enabled as an output, set the bit `GPIO_FUNC x _OEN_SEL` in register `GPIO_FUNC x _OUT_SEL_CFG_REG` and the bit in register `GPIO_ENABLE/ENABLE1_W1TS_REG`, corresponding to GPIO pin X . To have the output enable signal decided by internal logic (for example, the `SPIQ_oe` in column "Output enable signal when `GPIO_FUNC n _OEN_SEL = 0`" in Table 5-2), clear the bit `GPIO_FUNC x _OEN_SEL` instead.
 - Set the corresponding bit in register `GPIO_ENABLE/ENABLE1_W1TC_REG` to disable the output from the GPIO pin.
2. For an open drain output, set the bit `GPIO_PIN x _PAD_DRIVER` in register `GPIO_PIN x _REG` corresponding to GPIO pin X .
3. Configure IO MUX register to enable output via GPIO matrix. Set the `IO_MUX_ x _REG` corresponding to GPIO pin X as follows:
 - Set the field `IO_MUX_MCU_SEL` to desired IO MUX function corresponding to GPIO pin X . This is Function 1 (GPIO function), numeric value 1, for all pins.
 - Set the field `IO_MUX_FUN_DRV` to the desired value for output strength (0 ~ 3). The higher the driver strength, the more current can be sourced/sunk from the pin.
 - 0: ~5 mA
 - 1: ~10 mA
 - 2: ~20 mA (default value)
 - 3: ~40 mA
 - If using open drain mode, set/clear `IO_MUX_FUN_WPU` and `IO_MUX_FUN_WPD` to enable/disable the internal pull-up/pull-down resistors.

Note:

1. The output signal from a single peripheral can be sent to multiple pins simultaneously.
2. The output signal can be inverted by setting `GPIO_FUNC x _OUT_INV_SEL`.

5.5.3 Simple GPIO Output

GPIO matrix can also be used for simple GPIO output. This can be done as below:

- Set GPIO matrix `GPIO_FUNC n _OUT_SEL` with a special peripheral index 256 (0x100);
- Set the corresponding bit in `GPIO_OUT_REG[31:0]` or `GPIO_OUT1_REG[21:0]` to the desired GPIO output value.

Note:

- `GPIO_OUT_REG[21:0]` and `GPIO_OUT_REG[31:26]` correspond to GPIO0 ~ 21 and GPIO26 ~ 31, respectively. `GPIO_OUT_REG[25:22]` are invalid.
- `GPIO_OUT1_REG[16:0]` correspond to GPIO32 ~ 48, and `GPIO_OUT1_REG[21:17]` are invalid.
- Recommended operation: use corresponding W1TS and W1TC registers, such as `GPIO_OUT_W1TS/GPIO_OUT_W1TC` to set or clear the registers `GPIO_OUT_REG/GPIO_OUT1_REG`.

5.5.4 Sigma Delta Modulated Output

5.5.4.1 Functional Description

Eight out of the 256 peripheral outputs (index: 93 ~ 100 in Table 5-2) support 1-bit second-order sigma delta modulation. By default output is enabled for these eight channels. This Sigma Delta modulator can also output PDM (pulse density modulation) signal with configurable duty cycle. The transfer function is:

$$H(z) = X(z)z^{-1} + E(z)(1-z^{-1})^2$$

$E(z)$ is quantization error and $X(z)$ is the input.

This modulator supports scaling down of APB_CLK by divider 1 ~ 256:

- Set `GPIO_FUNCTION_CLK_EN` to enable the modulator clock.
- Configure `GPIO_SD n _PRESCALE` (n is 0 ~ 7 for eight channels).

After scaling, the clock cycle is equal to one pulse output cycle from the modulator.

`GPIO_SD n _IN` is a signed number with a range of [-128, 127] and is used to control the duty cycle¹ of PDM output signal.

- `GPIO_SD n _IN` = -128, the duty cycle of the output signal is 0%.
- `GPIO_SD n _IN` = 0, the duty cycle of the output signal is near 50%.
- `GPIO_SD n _IN` = 127, the duty cycle of the output signal is close to 100%.

The formula for calculating PDM signal duty cycle is shown as below:

$$Duty_Cycle = \frac{GPIO_SDn_IN + 128}{256}$$

Note:

For PDM signals, duty cycle refers to the percentage of high level cycles to the whole statistical period (several pulse

cycles, for example 256 pulse cycles).

5.5.4.2 SDM Configuration

The configuration of SDM is shown below:

- Route one of SDM outputs to a pin via GPIO matrix, see Section 5.5.2.
- Enable the modulator clock by setting `GPIO_FUNCTION_CLK_EN`.
- Configure the divider value by setting `GPIO_SD n _PRESCALE`.
- Configure the duty cycle of SDM output signal by setting `GPIO_SD n _IN`.

5.6 Direct Input and Output via IO MUX

5.6.1 Overview

Some high-speed signals (SPI and JTAG) can bypass GPIO matrix for better high-frequency digital performance. In this case, IO MUX is used to connect these pins directly to the peripherals.

This option is less flexible than routing signals via GPIO matrix, as the IO MUX register for each GPIO pin can only select from a limited number of functions, but high-frequency digital performance can be improved.

5.6.2 Functional Description

Two registers must be configured in order to bypass GPIO matrix for peripheral input signals:

1. `IO_MUX_MCU_SEL` for the GPIO pin must be set to the required pin function. For the list of pin functions, please refer to Section 5.12.
2. Clear `GPIO_SIG n _IN_SEL` to route the input directly to the peripheral.

To bypass GPIO matrix for peripheral output signals, `IO_MUX_MCU_SEL` for the GPIO pin must be set to the required pin function. For the list of pin functions, please refer to Section 5.12.

Note:

Not all signals can be connected to peripheral via IO MUX. Some input/output signals can only be connected to peripheral via GPIO matrix.

5.7 RTC IO MUX for Low Power and Analog Input/Output

5.7.1 Overview

ESP32-S3 provides 22 GPIO pins with low power capabilities (RTC) and analog functions, which are handled by the RTC subsystem of ESP32-S3. IO MUX and GPIO matrix are not used for these functions, rather, RTC IO MUX is used to redirect 22 RTC input/output signals to the RTC subsystem.

When configured as RTC GPIOs, the output pins can still retain the output level value when the chip is in Deep-sleep mode, and the input pins can wake up the chip from Deep-sleep.

5.7.2 Low Power Capabilities

The pins with RTC functions are controlled by `RTC_IO_TOUCH/RTC_PAD n _MUX_SEL` bit in register `RTC_IO_TOUCH/RTC_PAD n _REG`. By default all bits in these registers are set to 0, routing all input/output signals via IO MUX.

If `RTC_IO_TOUCH/RTC_PAD n _MUX_SEL` is set to 1, then input/output signals to and from that pin is routed to the RTC subsystem. In this mode, `RTC_IO_TOUCH/RTC_PAD n _REG` is used to control RTC low power pins. Note that `RTC_IO_TOUCH/RTC_PAD n _REG` applies the RTC GPIO pin numbering, not the GPIO pin numbering. See Table 5-4 for RTC functions of RTC IO MUX pins.

5.7.3 Analog Functions

When the pin is used for analog purpose, make sure this pin is left floating by configuring the register `RTC_IO_TOUCH/RTC_PAD n _REG`. By such way, external analog signal is connected to internal analog signal via GPIO pin. The configuration is as follows:

- Set `RTC_IO_TOUCH/RTC_PAD n _MUX_SEL`, to select RTC IO MUX to route input and output signals.
- Clear `RTC_IO_TOUCH/RTC_PAD n _FUN_IE`, `RTC_IO_TOUCH/RTC_PAD n _FUN_RUE`, and `RTC_IO_TOUCH/RTC_PAD n _FUN_RDE`, to set this pin floating.
- Configure `RTC_IO_TOUCH/RTC_PAD n _FUN_SEL` to 0, to enable analog function 0.
- Write 1 to `RTC_GPIO_ENABLE_W1TC`, to clear output enable.

See Table 5-5 for analog functions of RTC IO MUX pins.

5.8 Pin Functions in Light-sleep

Pins may provide different functions when ESP32-S3 is in Light-sleep mode. If `IO_MUX_SLP_SEL` in register `IO_MUX n _REG` for a GPIO pin is set to 1, a different set of bits will be used to control the pin when the chip is in Light-sleep mode.

Table 5-1. Bits Used to Control IO MUX Functions in Light-sleep Mode

IO MUX Functions	Normal Execution OR <code>IO_MUX_SLP_SEL = 0</code>	Light-sleep Mode AND <code>IO_MUX_SLP_SEL = 1</code>
Output Drive Strength	<code>IO_MUX_FUN_DRV</code>	<code>IO_MUX_FUN_DRV</code>
Pull-up Resistor	<code>IO_MUX_FUN_WPU</code>	<code>IO_MUX_MCU_WPU</code>
Pull-down Resistor	<code>IO_MUX_FUN_WPD</code>	<code>IO_MUX_MCU_WPD</code>
Output Enable	<code>OEN_SEL</code> from GPIO matrix *	<code>IO_MUX_MCU_OE</code>

Note:

If `IO_MUX_SLP_SEL` is set to 0, pin functions remain the same in both normal execution and Light-sleep mode. Please refer to Section 5.5.2 for how to enable output in normal execution.

5.9 Pin Hold Feature

Each GPIO pin (including the RTC pins) has an individual hold function controlled by an RTC register. When the pin is set to hold, the state is latched at that moment and will not change no matter how the internal signals change or how the IO MUX/GPIO configuration is modified. Users can use the hold function for the pins to retain the pin state through a core reset and system reset triggered by watchdog time-out or Deep-sleep events.

Note:

- For digital pins, to maintain pin input/output status in Deep-sleep mode, users can set `RTC_CNTL_DG_PAD_FORCE_UNHOLD` to 0 before powering down. For RTC pins, the input and output values are controlled by the corresponding bits of register `RTC_CNTL_PAD_HOLD_REG`, and users can set it to 1 to hold the value or set it to 0 to unhold the value.
- To disable the hold function after the chip is woken up, users can set `RTC_CNTL_DG_PAD_FORCE_UNHOLD` to 1. To maintain the hold function of the pin, users can set the corresponding bit in register `RTC_CNTL_PAD_HOLD_REG` to 1.

5.10 Power Supply and Management of GPIO Pins

5.10.1 Power Supply of GPIO Pins

For more information on the power supply for GPIO pins, please refer to Pin Definition in [ESP32-S3 Datasheet](#).

5.10.2 Power Supply Management

Each ESP32-S3 pin is connected to one of the three different power domains.

- `VDD3P3_RTC`: the input power supply for both RTC and CPU
- `VDD3P3_CPU`: the input power supply for CPU
- `VDD_SPI`: configurable input/output power supply

`VDD_SPI` can be configured to use an internal LDO. The LDO input and output both are 1.8 V. If the LDO is not enabled, `VDD_SPI` is connected directly to the same power supply as `VDD3P3_RTC`.

The `VDD_SPI` configuration is determined by the value of strapping pin GPIO45, or can be overridden by eFuse and/or register settings. See [ESP32-S3 Datasheet](#) sections Power Scheme and Strapping Pins for more details.

Note that GPIO33 ~ GPIO37 can be powered either by `VDD_SPI` or `VDD3P3_CPU`.

5.11 Peripheral Signals via GPIO Matrix

Table 5-2 shows the peripheral input/output signals via GPIO matrix.

Please pay attention to the configuration of the bit `GPIO_FUNC n _OEN_SEL`:

- `GPIO_FUNC n _OEN_SEL` = 1: the output enable is controlled by the corresponding bit n of `GPIO_ENABLE_REG`:
 - `GPIO_ENABLE_REG` = 0: output is disabled;

- `GPIO_ENABLE_REG = 1`: output is enabled;
- `GPIO_FUNC n _OEN_SEL = 0`: use the output enable signal from peripheral, for example `SPIQ_oe` in the column “Output enable signal when `GPIO_FUNC n _OEN_SEL = 0`” of Table 5-2. Note that the signals such as `SPIQ_oe` can be 1 (1'd1) or 0 (1'd0), depending on the configuration of corresponding peripherals. If it's 1'd1 in the “Output enable signal when `GPIO_FUNC n _OEN_SEL = 0`”, it indicates that once the register `GPIO_FUNC n _OEN_SEL` is cleared, the output signal is always enabled by default.

Note:

Signals are numbered consecutively, but not all signals are valid.

- Only the signals with a name assigned in the column “Input signal” in Table 5-2 are valid input signals.
- Only the signals with a name assigned in the column “Output signal” in Table 5-2 are valid output signals.

Table 5-2. Peripheral Signals via GPIO Matrix

Signal No.	Input Signal	Default value	Direct Input via IO MUX	Output Signal	Output enable signal when GPIO_FUNC _n _OEN_SEL = 0	Direct Output via IO MUX

5.12 IO MUX Function List

Table 5-3 shows the IO MUX functions of each GPIO pin.

Table 5-3. IO MUX Pin Functions

GPIO	Pin Name	Function 0	Function 1	Function 2	Function 3	Function 4	DRV	RST	Notes
0	GPIO0	GPIO0	GPIO0	-	-	-	2	3	R
1	GPIO1	GPIO1	GPIO1	-	-	-	2	1	R
2	GPIO2	GPIO2	GPIO2	-	-	-	2	1	R
3	GPIO3	GPIO3	GPIO3	-	-	-	2	1	R
4	GPIO4	GPIO4	GPIO4	-	-	-	2	0	R
5	GPIO5	GPIO5	GPIO5	-	-	-	2	0	R
6	GPIO6	GPIO6	GPIO6	-	-	-	2	0	R
7	GPIO7	GPIO7	GPIO7	-	-	-	2	0	R
8	GPIO8	GPIO8	GPIO8	-	SUBSPICS1	-	2	0	R
9	GPIO9	GPIO9	GPIO9	-	SUBSPIHD	FSPIDHD	2	1	R
10	GPIO10	GPIO10	GPIO10	FSPIIO4	SUBSPICS0	FSPICS0	2	1	R
11	GPIO11	GPIO11	GPIO11	FSPIIO5	SUBSPID	FSPID	2	1	R
12	GPIO12	GPIO12	GPIO12	FSPIIO6	SUBSPICLK	FSPICLK	2	1	R
13	GPIO13	GPIO13	GPIO13	FSPIIO7	SUBSPIQ	FSPIQ	2	1	R
14	GPIO14	GPIO14	GPIO14	FSPIDQS	SUBSPIWP	FSPWP	2	1	R
15	XTAL_32K_P	GPIO15	GPIO15	U0RTS	-	-	2	0	R
16	XTAL_32K_N	GPIO16	GPIO16	U0CTS	-	-	2	0	R
17	GPIO17	GPIO17	GPIO17	U1TXD	-	-	2	1	R
18	GPIO18	GPIO18	GPIO18	U1RXD	CLK_OUT3	-	2	1	R
19	GPIO19	GPIO19	GPIO19	U1RTS	CLK_OUT2	-	3	0	R
20	GPIO20	GPIO20	GPIO20	U1CTS	CLK_OUT1	-	3	0	R
21	GPIO21	GPIO21	GPIO21	-	-	-	2	0	R
26	SPICS1	SPICS1	GPIO26	-	-	-	2	3	-
27	SPIHD	SPIHD	GPIO27	-	-	-	2	3	-
28	SPIWP	SPIWP	GPIO28	-	-	-	2	3	-
29	SPICS0	SPICS0	GPIO29	-	-	-	2	3	-
30	SPICLK	SPICLK	GPIO30	-	-	-	2	3	-
31	SPIQ	SPIQ	GPIO31	-	-	-	2	3	-
32	SPID	SPID	GPIO32	-	-	-	2	3	-
33	GPIO33	GPIO33	GPIO33	FSPIDHD	SUBSPIHD	SPIIO4	2	1	-
34	GPIO34	GPIO34	GPIO34	FSPICS0	SUBSPICS0	SPIIO5	2	1	-
35	GPIO35	GPIO35	GPIO35	FSPID	SUBSPID	SPIIO6	2	1	-
36	GPIO36	GPIO36	GPIO36	FSPICLK	SUBSPICLK	SPIIO7	2	1	-
37	GPIO37	GPIO37	GPIO37	FSPIQ	SUBSPIQ	SPIDQS	2	1	-
38	GPIO38	GPIO38	GPIO38	FSPWP	SUBSPIWP	-	2	1	-
39	MTCK	MTCK	GPIO39	CLK_OUT3	SUBSPICS1	-	2	1*	-
40	MTDO	MTDO	GPIO40	CLK_OUT2	-	-	2	1	-
41	MTDI	MTDI	GPIO41	CLK_OUT1	-	-	2	1	-
42	MTMS	MTMS	GPIO42	-	-	-	2	1	-

GPIO	Pin Name	Function 0	Function 1	Function 2	Function 3	Function 4	DRV	RST	Notes
43	U0TXD	U0TXD	GPIO43	CLK_OUT1	-	-	2	4	-
44	U0RXD	U0RXD	GPIO44	CLK_OUT2	-	-	2	3	-
45	GPIO45	GPIO45	GPIO45	-	-	-	2	2	-
46	GPIO46	GPIO46	GPIO46	-	-	-	2	2	-
47	SPICLK_P	SPICLK_DIFF	GPIO47	SUBSPICLK_P_DIFF	-	-	2	1	-
48	SPICLK_N	SPICLK_DIFF	GPIO48	SUBSPICLK_N_DIFF	-	-	2	1	-

Drive Strength

“DRV” column shows the drive strength of each pin after reset:

- **0** - Drive current = ~5 mA
- **1** - Drive current = ~10 mA
- **2** - Drive current = ~20 mA
- **3** - Drive current = ~40 mA

Reset Configurations

“RST” column shows the default configuration of each pin after reset:

- **0** - IE = 0 (input disabled)
- **1** - IE = 1 (input enabled)
- **2** - IE = 1, WPD = 1 (input enabled, pull-down resistor enabled)
- **3** - IE = 1, WPU = 1 (input enabled, pull-up resistor enabled)
- **4** - OE = 1, WPU = 1 (output enabled, pull-up resistor enabled)
- **1*** - If EFUSE_DIS_JTAG = 1, the pin MTCK is left floating after reset, i.e. IE = 1. If EFUSE_DIS_JTAG = 0, the pin MTCK is connected to internal pull-up resistor, i.e. IE = 1, WPU = 1.

Note:

- **R** - Pin has RTC/analog functions via RTC IO MUX.

Please refer to Appendix A – ESP32-S3 Pin Lists in [ESP32-S3 Datasheet](#) for more details.

5.13 RTC IO MUX Pin List

Table 5-4 shows the RTC pins, their corresponding GPIO pins and RTC functions.

Table 5-4. RTC Functions of RTC IO MUX Pins

RTC GPIO Num	GPIO Num	Pin Name	RTC Function			
			0	1	2	3
0	0	GPIO0	RTC_GPIO0	-	-	sar_i2c_scl_0 ^a
1	1	GPIO1	RTC_GPIO1	-	-	sar_i2c_sda_0 ^a
2	2	GPIO2	RTC_GPIO2	-	-	sar_i2c_scl_1 ^a
3	3	GPIO3	RTC_GPIO3	-	-	sar_i2c_sda_1 ^a

20	20	GPIO20	USB_D+	ADC2_CH9
21	21	GPIO21	-	-

5.14 Register Summary

5.14.1 GPIO Matrix Register Summary

The addresses in this section are relative to the GPIO base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
GPIO Configuration Registers			
GPIO_BT_SELECT_REG	GPIO bit select register	0x0000	R/W
GPIO_OUT_REG	GPIO0 ~ 31 output register	0x0004	R/W
GPIO_OUT_W1TS_REG	GPIO0 ~ 31 output bit set register	0x0008	WO
GPIO_OUT_W1TC_REG	GPIO0 ~ 31 output bit clear register	0x000C	WO
GPIO_OUT1_REG	GPIO32 ~ 48 output register	0x0010	R/W
GPIO_OUT1_W1TS_REG	GPIO32 ~ 48 output bit set register	0x0014	WO
GPIO_OUT1_W1TC_REG	GPIO32 ~ 48 output bit clear register	0x0018	WO
GPIO_SDIO_SELECT_REG	GPIO SDIO selection register	0x001C	R/W
GPIO_ENABLE_REG	GPIO0 ~ 31 output enable register	0x0020	R/W
GPIO_ENABLE_W1TS_REG	GPIO0 ~ 31 output enable bit set register	0x0024	WO
GPIO_ENABLE_W1TC_REG	GPIO0 ~ 31 output enable bit clear register	0x0028	WO
GPIO_ENABLE1_REG	GPIO32 ~ 48 output enable register	0x002C	R/W
GPIO_ENABLE1_W1TS_REG	GPIO32 ~ 48 output enable bit set register	0x0030	WO
GPIO_ENABLE1_W1TC_REG	GPIO32 ~ 48 output enable bit clear register	0x0034	WO
GPIO_STRAP_REG	Strapping pin value register	0x0038	RO
GPIO_IN_REG	GPIO0 ~ 31 input register	0x003C	RO
GPIO_IN1_REG	GPIO32 ~ 48 input register	0x0040	RO
GPIO_PIN0_REG	Configuration for GPIO pin 0	0x0074	R/W
GPIO_PIN1_REG	Configuration for GPIO pin 1	0x0078	R/W
GPIO_PIN2_REG	Configuration for GPIO pin 2	0x007C	R/W
...
GPIO_PIN46_REG	Configuration for GPIO pin 46	0x012C	R/W
GPIO_PIN47_REG	Configuration for GPIO pin 47	0x0130	R/W
GPIO_PIN48_REG	Configuration for GPIO pin 48	0x0134	R/W
GPIO_FUNC0_IN_SEL_CFG_REG	Peripheral function 0 input selection register	0x0154	R/W
GPIO_FUNC1_IN_SEL_CFG_REG	Peripheral function 1 input selection register	0x0158	R/W

Name	Description	Address	Access
GPIO_FUNC2_IN_SEL_CFG_REG	Peripheral function 2 input selection register	0x015C	R/W
...
GPIO_FUNC253_IN_SEL_CFG_REG	Peripheral function 253 input selection register	0x0548	R/W
GPIO_FUNC254_IN_SEL_CFG_REG	Peripheral function 254 input selection register	0x054C	R/W
GPIO_FUNC255_IN_SEL_CFG_REG	Peripheral function 255 input selection register	0x0550	R/W
GPIO_FUNC0_OUT_SEL_CFG_REG	Peripheral output selection for GPIO0	0x0554	R/W
GPIO_FUNC1_OUT_SEL_CFG_REG	Peripheral output selection for GPIO1	0x0558	R/W
GPIO_FUNC2_OUT_SEL_CFG_REG	Peripheral output selection for GPIO2	0x055C	R/W
...
GPIO_FUNC47_OUT_SEL_CFG_REG	Peripheral output selection for GPIO47	0x0610	R/W
GPIO_FUNC48_OUT_SEL_CFG_REG	Peripheral output selection for GPIO47	0x0614	R/W
GPIO_CLOCK_GATE_REG	GPIO clock gating register	0x062C	R/W
Interrupt Status Registers			
GPIO_STATUS_REG	GPIO0 ~ 31 interrupt status register	0x0044	R/W
GPIO_STATUS1_REG	GPIO32 ~ 48 interrupt status register	0x0050	R/W
GPIO_CPU_INT_REG	GPIO0 ~ 31 CPU interrupt status register	0x005C	RO
GPIO_CPU_NMI_INT_REG	GPIO0 ~ 31 CPU non-maskable interrupt status register	0x0060	RO
GPIO_CPU_INT1_REG	GPIO32 ~ 48 CPU interrupt status register	0x0068	RO
GPIO_CPU_NMI_INT1_REG	GPIO32 ~ 48 CPU non-maskable interrupt status register	0x006C	RO
Interrupt Configuration Registers			
GPIO_STATUS_W1TS_REG	GPIO0 ~ 31 interrupt status bit set register	0x0048	WO
GPIO_STATUS_W1TC_REG	GPIO0 ~ 31 interrupt status bit clear register	0x004C	WO
GPIO_STATUS1_W1TS_REG	GPIO32 ~ 48 interrupt status bit set register	0x0054	WO
GPIO_STATUS1_W1TC_REG	GPIO32 ~ 48 interrupt status bit clear register	0x0058	WO
GPIO Interrupt Source Registers			
GPIO_STATUS_NEXT_REG	GPIO0 ~ 31 interrupt source register	0x014C	RO
GPIO_STATUS_NEXT1_REG	GPIO32 ~ 48 interrupt source register	0x0150	RO
Version Register			
GPIO_DATE_REG	Version control register	0x06FC	R/W

5.14.2 IO MUX Register Summary

The addresses in this section are relative to the IO MUX base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
IO_MUX_PIN_CTRL_REG	Clock output configuration register	0x0000	R/W
IO_MUX_GPIO0_REG	Configuration register for pin GPIO0	0x0004	R/W
IO_MUX_GPIO1_REG	Configuration register for pin GPIO1	0x0008	R/W
IO_MUX_GPIO2_REG	Configuration register for pin GPIO2	0x000C	R/W
IO_MUX_GPIO3_REG	Configuration register for pin GPIO3	0x0010	R/W
IO_MUX_GPIO4_REG	Configuration register for pin GPIO4	0x0014	R/W

Name	Description	Address	Access
IO_MUX_GPIO5_REG	Configuration register for pin GPIO5	0x0018	R/W
IO_MUX_GPIO6_REG	Configuration register for pin GPIO6	0x001C	R/W
IO_MUX_GPIO7_REG	Configuration register for pin GPIO7	0x0020	R/W
IO_MUX_GPIO8_REG	Configuration register for pin GPIO8	0x0024	R/W
IO_MUX_GPIO9_REG	Configuration register for pin GPIO9	0x0028	R/W
IO_MUX_GPIO10_REG	Configuration register for pin GPIO10	0x002C	R/W
IO_MUX_GPIO11_REG	Configuration register for pin GPIO11	0x0030	R/W
IO_MUX_GPIO12_REG	Configuration register for pin GPIO12	0x0034	R/W
IO_MUX_GPIO13_REG	Configuration register for pin GPIO13	0x0038	R/W
IO_MUX_GPIO14_REG	Configuration register for pin GPIO14	0x003C	R/W
IO_MUX_GPIO15_REG	Configuration register for pad XTAL_32K_P	0x0040	R/W
IO_MUX_GPIO16_REG	Configuration register for pad XTAL_32K_N	0x0044	R/W
IO_MUX_GPIO17_REG	Configuration register for pad DAC_1	0x0048	R/W
IO_MUX_GPIO18_REG	Configuration register for pad DAC_2	0x004C	R/W
IO_MUX_GPIO19_REG	Configuration register for pin GPIO19	0x0050	R/W
IO_MUX_GPIO20_REG	Configuration register for pin GPIO20	0x0054	R/W
IO_MUX_GPIO21_REG	Configuration register for pin GPIO21	0x0058	R/W
IO_MUX_GPIO26_REG	Configuration register for pad SPICS1	0x006C	R/W
IO_MUX_GPIO27_REG	Configuration register for pad SPIHD	0x0070	R/W
IO_MUX_GPIO28_REG	Configuration register for pad SPIWP	0x0074	R/W
IO_MUX_GPIO29_REG	Configuration register for pad SPICS0	0x0078	R/W
IO_MUX_GPIO30_REG	Configuration register for pad SPICLK	0x007C	R/W
IO_MUX_GPIO31_REG	Configuration register for pad SPIQ	0x0080	R/W
IO_MUX_GPIO32_REG	Configuration register for pad SPID	0x0084	R/W
IO_MUX_GPIO33_REG	Configuration register for pin GPIO33	0x0088	R/W
IO_MUX_GPIO34_REG	Configuration register for pin GPIO34	0x008C	R/W

5.14.3 SDM Output Register Summary

The addresses in this section are relative to (GPIO base address provided in Table 3-3 in Chapter 3 *System and Memory* + 0x0F00).

Name	Description	Address	Access
Configuration Registers			
GPIO_SIGMADELTA0_REG	Duty Cycle Configure Register of SDM0	0x0000	R/W
GPIO_SIGMADELTA1_REG	Duty Cycle Configure Register of SDM1	0x0004	R/W
GPIO_SIGMADELTA2_REG	Duty Cycle Configure Register of SDM2	0x0008	R/W
GPIO_SIGMADELTA3_REG	Duty Cycle Configure Register of SDM3	0x000C	R/W
GPIO_SIGMADELTA4_REG	Duty Cycle Configure Register of SDM4	0x0010	R/W
GPIO_SIGMADELTA5_REG	Duty Cycle Configure Register of SDM5	0x0014	R/W
GPIO_SIGMADELTA6_REG	Duty Cycle Configure Register of SDM6	0x0018	R/W
GPIO_SIGMADELTA7_REG	Duty Cycle Configure Register of SDM7	0x001C	R/W
GPIO_SIGMADELTA_CG_REG	Clock Gating Configure Register	0x0020	R/W
GPIO_SIGMADELTA_MISC_REG	MISC Register	0x0024	R/W
GPIO_SIGMADELTA_VERSION_REG	Version Control Register	0x0028	R/W

5.14.4 RTC IO MUX Register Summary

The addresses in this section are relative to (Low-Power Management base address provided in Table 3-3 in Chapter 3 *System and Memory* + 0x0400).

Name	Description	Address	Access
GPIO configuration/data registers			
RTC_GPIO_OUT_REG	RTC GPIO output register	0x0000	R/W
RTC_GPIO_OUT_W1TS_REG	RTC GPIO output bit set register	0x0004	WO
RTC_GPIO_OUT_W1TC_REG	RTC GPIO output bit clear register	0x0008	WO
RTC_GPIO_ENABLE_REG	RTC GPIO output enable register	0x000C	R/W
RTC_GPIO_ENABLE_W1TS_REG	RTC GPIO output enable bit set register	0x0010	WO
RTC_GPIO_ENABLE_W1TC_REG	RTC GPIO output enable bit clear register	0x0014	WO
RTC_GPIO_STATUS_REG	RTC GPIO interrupt status register	0x0018	R/W
RTC_GPIO_STATUS_W1TS_REG	RTC GPIO interrupt status bit set register	0x001C	WO
RTC_GPIO_STATUS_W1TC_REG	RTC GPIO interrupt status bit clear register	0x0020	WO
RTC_GPIO_IN_REG	RTC GPIO input register	0x0024	RO
RTC_GPIO_PIN0_REG	RTC configuration for pin 0	0x0028	R/W
RTC_GPIO_PIN1_REG	RTC configuration for pin 1	0x002C	R/W
RTC_GPIO_PIN2_REG	RTC configuration for pin 2	0x0030	R/W
RTC_GPIO_PIN3_REG	RTC configuration for pin 3	0x0034	R/W
RTC_GPIO_PIN4_REG	RTC configuration for pin 4	0x0038	R/W
RTC_GPIO_PIN5_REG	RTC configuration for pin 5	0x003C	R/W
RTC_GPIO_PIN6_REG	RTC configuration for pin 6	0x0040	R/W
RTC_GPIO_PIN7_REG	RTC configuration for pin 7	0x0044	R/W
RTC_GPIO_PIN8_REG	RTC configuration for pin 8	0x0048	R/W
RTC_GPIO_PIN9_REG	RTC configuration for pin 9	0x004C	R/W

Name	Description	Address	Access
RTC_GPIO_PIN10_REG	RTC configuration for pin 10	0x0050	R/W
RTC_GPIO_PIN11_REG	RTC configuration for pin 11	0x0054	R/W
RTC_GPIO_PIN12_REG	RTC configuration for pin 12	0x0058	R/W
RTC_GPIO_PIN13_REG	RTC configuration for pin 13	0x005C	R/W
RTC_GPIO_PIN14_REG	RTC configuration for pin 14	0x0060	R/W
RTC_GPIO_PIN15_REG	RTC configuration for pin 15	0x0064	R/W
RTC_GPIO_PIN16_REG	RTC configuration for pin 16	0x0068	R/W
RTC_GPIO_PIN17_REG	RTC configuration for pin 17	0x006C	R/W
RTC_GPIO_PIN18_REG	RTC configuration for pin 18	0x0070	R/W
RTC_GPIO_PIN19_REG	RTC configuration for pin 19	0x0074	R/W
RTC_GPIO_PIN20_REG	RTC configuration for pin 20	0x0078	R/W
RTC_GPIO_PIN21_REG	RTC configuration for pin 21	0x007C	R/W
GPIO RTC function configuration registers			
RTC_IO_TOUCH_PAD0_REG	Touch pin 0 configuration register	0x0084	R/W
RTC_IO_TOUCH_PAD1_REG	Touch pin 1 configuration register	0x0088	R/W
RTC_IO_TOUCH_PAD2_REG	Touch pin 2 configuration register	0x008C	R/W
RTC_IO_TOUCH_PAD3_REG	Touch pin 3 configuration register	0x0090	R/W
RTC_IO_TOUCH_PAD4_REG	Touch pin 4 configuration register	0x0094	R/W
RTC_IO_TOUCH_PAD5_REG	Touch pin 5 configuration register	0x0098	R/W
RTC_IO_TOUCH_PAD6_REG	Touch pin 6 configuration register	0x009C	R/W
RTC_IO_TOUCH_PAD7_REG	Touch pin 7 configuration register	0x00A0	R/W
RTC_IO_TOUCH_PAD8_REG	Touch pin 8 configuration register	0x00A4	R/W
RTC_IO_TOUCH_PAD9_REG	Touch pin 9 configuration register	0x00A8	R/W
RTC_IO_TOUCH_PAD10_REG	Touch pin 10 configuration register	0x00AC	R/W
RTC_IO_TOUCH_PAD11_REG	Touch pin 11 configuration register	0x00B0	R/W
RTC_IO_TOUCH_PAD12_REG	Touch pin 12 configuration register	0x00B4	R/W
RTC_IO_TOUCH_PAD13_REG	Touch pin 13 configuration register	0x00B8	R/W
RTC_IO_TOUCH_PAD14_REG	Touch pin 14 configuration register	0x00BC	R/W
RTC_IO_XTAL_32P_PAD_REG	32 kHz crystal P-pin configuration register	0x00C0	R/W
RTC_IO_XTAL_32N_PAD_REG	32 kHz crystal N-pin configuration register	0x00C4	R/W
RTC_IO_RTC_PAD17_REG	RTC pin 17 configuration register	0x00C8	R/W
RTC_IO_RTC_PAD18_REG	RTC pin 18 configuration register	0x00CC	R/W
RTC_IO_RTC_PAD19_REG	RTC pin 19 configuration register	0x00D0	R/W
RTC_IO_RTC_PAD20_REG	RTC pin 20 configuration register	0x00D4	R/W
RTC_IO_RTC_PAD21_REG	RTC pin 21 configuration register	0x00D8	R/W
RTC_IO_XTL_EXT_CTR_REG	Crystal power down enable GPIO source	0x00E0	R/W
RTC_IO_SAR_I2C_IO_REG	RTC I2C pin selection	0x00E4	R/W
Version Register			
RTC_IO_DATE_REG	Version control register	0x01FC	R/W

5.15 Registers

5.15.1 GPIO Matrix Registers

The addresses in this section are relative to the GPIO base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 5.1. GPIO_BT_SELECT_REG (0x0000)

GPIO_BT_SEL Reserved (R/W)

Register 5.2. GPIO_OUT_REG (0x0004)

GPIO_OUT_DATA_ORIG GPIO0 ~ 21 and GPIO26 ~ 31 output values in simple GPIO output mode. The values of bit0 ~ bit21 correspond to the output values of GPIO0 ~ 21, and bit26 ~ bit31 to GPIO26 ~ 31. Bit22 ~ bit25 are invalid. (R/W)

Register 5.3. GPIO_OUT_W1TS_REG (0x0008)

GPIO_OUT_W1TS GPIO0 ~ 31 output set register. If the value 1 is written to a bit here, the corresponding bit in **GPIO_OUT_REG** will be set to 1. Recommended operation: use this register to set **GPIO_OUT_REG**. (WO)

Register 5.4. GPIO_OUT_W1TC_REG (0x000C)

GPIO_OUT_W1TC GPIO0 ~ 31 output clear register. If the value 1 is written to a bit here, the corresponding bit in **GPIO_OUT_REG** will be cleared. Recommended operation: use this register to clear **GPIO_OUT_REG**. (WO)

Register 5.5. GPIO_OUT1_REG (0x0010)

GPIO_OUT1_DATA_ORIG GPIO32 ~ 48 output value in simple GPIO output mode. The values of bit0 ~ bit16 correspond to GPIO32 ~ GPIO48. Bit17 ~ bit21 are invalid. (R/W)

Register 5.6. GPIO_OUT1_W1TS_REG (0x0014)

GPIO_OUT1_W1TS GPIO32 ~ 48 output value set register. If the value 1 is written to a bit here, the corresponding bit in **GPIO_OUT1_REG** will be set to 1. Recommended operation: use this register to set **GPIO_OUT1_REG**. (WO)

Register 5.7. GPIO_OUT1_W1TC_REG (0x0018)

GPIO_OUT1_W1TC GPIO32 ~ 48 output value clear register. If the value 1 is written to a bit here, the corresponding bit in **GPIO_OUT1_REG** will be cleared. Recommended operation: use this register to clear **GPIO_OUT1_REG**. (WO)

Register 5.8. GPIO_SDIO_SELECT_REG (0x001C)

GPIO_SDIO_SEL Reserved (R/W)

Register 5.9. GPIO_ENABLE_REG (0x0020)

GPIO_ENABLE_DATA GPIO0~31 output enable register. (R/W)

Register 5.10. GPIO_ENABLE_W1TS_REG (0x0024)

GPIO_ENABLE_W1TS GPIO0 ~ 31 output enable set register. If the value 1 is written to a bit here, the corresponding bit in [GPIO_ENABLE_REG](#) will be set to 1. Recommended operation: use this register to set [GPIO_ENABLE_REG](#). (WO)

Register 5.11. GPIO_ENABLE_W1TC_REG (0x0028)

GPIO_ENABLE_W1TC GPIO0 ~ 31 output enable clear register. If the value 1 is written to a bit here, the corresponding bit in [GPIO_ENABLE_REG](#) will be cleared. Recommended operation: use this register to clear [GPIO_ENABLE_REG](#). (WO)

Register 5.12. GPIO_ENABLE1_REG (0x002C)

GPIO_ENABLE1_DATA GPIO32 ~ 48 output enable register. (R/W)

Register 5.13. GPIO_ENABLE1_W1TS_REG (0x0030)

(reserved)										GPIO_ENABLE1_W1TS													
31											22	21											0
0 0 0 0 0 0 0 0 0 0										0x0000										Reset			

GPIO_ENABLE1_W1TS GPIO32 ~ 48 output enable set register. If the value 1 is written to a bit here, the corresponding bit in [GPIO_ENABLE1_REG](#) will be set to 1. Recommended operation: use this register to set [GPIO_ENABLE1_REG](#). (WO)

Register 5.14. GPIO_ENABLE1_W1TC_REG (0x0034)

(reserved)										GPIO_ENABLE1_W1TC													
31											22	21											0
0 0 0 0 0 0 0 0 0 0										0x0000										Reset			

GPIO_ENABLE1_W1TC GPIO32 ~ 48 output enable clear register. If the value 1 is written to a bit here, the corresponding bit in [GPIO_ENABLE1_REG](#) will be cleared. Recommended operation: use this register to clear [GPIO_ENABLE1_REG](#). (WO)

Register 5.15. GPIO_STRAP_REG (0x0038)

(reserved)										GPIO_STRAPPING													
31											16	15											0
0 0 0 0 0 0 0 0 0 0										0										Reset			

GPIO_STRAPPING GPIO strapping values: bit5 ~ bit2 correspond to stripping pins GPIO3, GPIO45, GPIO0, and GPIO46 respectively. (RO)

Register 5.16. GPIO_IN_REG (0x003C)

GPIO_IN_DATA_NEXT GPIO0 ~ 31 input value. Each bit represents a pin input value, 1 for high level and 0 for low level. (RO)

Register 5.17. GPIO_IN1_REG (0x0040)

GPIO_IN_DATA1_NEXT GPIO32 ~ 48 input value. Each bit represents a pin input value. (RO)

Register 5.20. GPIO_FUNC x _OUT_SEL_CFG_REG (x : 0-48) (0x0554+0x4*x)

(reserved)												GPIO_FUNC x _OEN_INV_SEL			GPIO_FUNC x _OEN_SEL			GPIO_FUNC x _OUT_INV_SEL			GPIO_FUNC x _OUT_SEL			
31											12	11	10	9	8							0		
0												0			0			0			0x100			Reset

GPIO_FUNC x _OUT_SEL Selection control for GPIO output X . If a value Y ($0 \leq Y < 256$) is written to this field, the peripheral output signal Y will be connected to GPIO output X . If a value 256 is written to this field, bit X of [GPIO_OUT_REG/GPIO_OUT1_REG](#) and [GPIO_ENABLE_REG/GPIO_ENABLE1_REG](#) will be selected as the output value and output enable. (R/W)

GPIO_FUNC x _OUT_INV_SEL 0: Do not invert the output value; 1: Invert the output value. (R/W)

GPIO_FUNC x _OEN_SEL 0: Use output enable signal from peripheral; 1: Force the output enable signal to be sourced from [GPIO_ENABLE_REG\[x\]](#). (R/W)

GPIO_FUNC n _OEN_INV_SEL 0: Do not invert the output enable signal; 1: Invert the output enable signal. (R/W)

Register 5.21. GPIO_CLOCK_GATE_REG (0x062C)

(reserved)																													GPIO_CLK_EN		
31																												1	0		
0																													1		Reset

GPIO_CLK_EN Clock gating enable bit. If set to 1, the clock is free running. (R/W)

Register 5.22. GPIO_STATUS_REG (0x0044)

GPIO_STATUS_INTERRUPT																																
31																															0	
0x000000																																Reset

GPIO_STATUS_INTERRUPT GPIO0 ~ 31 interrupt status register. (R/W)

Register 5.23. GPIO_STATUS1_REG (0x0050)

GPIO_STATUS1_INTERRUPT GPIO32 ~ 48 interrupt status register. (R/W)

Register 5.24. GPIO_CPU_INT_REG (0x005C)

GPIO_CPU_INT GPIO0 ~ 31 CPU interrupt status. This interrupt status is corresponding to the bit in [GPIO_STATUS_REG](#) when assert (high) enable signal (bit13 of [GPIO_PIN \$n\$ _REG](#)). (RO)

Register 5.25. GPIO_CPU_NMI_INT_REG (0x0060)

GPIO_CPU_NMI_INT GPIO0 ~ 31 CPU non-maskable interrupt status. This interrupt status is corresponding to the bit in [GPIO_STATUS_REG](#) when assert (high) enable signal (bit 14 of [GPIO_PIN \$n\$ _REG](#)). (RO)

Register 5.26. GPIO_CPU_INT1_REG (0x0068)

31	(reserved)	22	21	GPIO_CPU1_INT	0
0 0 0 0 0 0 0 0 0 0 0				0x0000	
					Reset

GPIO_CPU1_INT GPIO32 ~ 48 CPU interrupt status. This interrupt status is corresponding to the bit in [GPIO_STATUS1_REG](#) when assert (high) enable signal (bit 13 of [GPIO_PIN \$n\$ _REG](#)). (RO)

Register 5.27. GPIO_CPU_NMI_INT1_REG (0x006C)

31	(reserved)	22	21	GPIO_CPU_NMI1_INT	0
0 0 0 0 0 0 0 0 0 0 0				0x0000	
					Reset

GPIO_CPU_NMI1_INT GPIO32 ~ 48 CPU non-maskable interrupt status. This interrupt status is corresponding to bit in [GPIO_STATUS1_REG](#) when assert (high) enable signal (bit 14 of [GPIO_PIN \$n\$ _REG](#)). (RO)

Register 5.28. GPIO_STATUS_W1TS_REG (0x0048)

31	GPIO_STATUS_W1TS	0
0x000000		Reset

GPIO_STATUS_W1TS GPIO0 ~ 31 interrupt status set register. If the value 1 is written to a bit here, the corresponding bit in [GPIO_STATUS_INTERRUPT](#) will be set to 1. Recommended operation: use this register to set [GPIO_STATUS_INTERRUPT](#). (WO)

Register 5.29. GPIO_STATUS_W1TC_REG (0x004C)

GPIO_STATUS_W1TC GPIO0 ~ 31 interrupt status clear register. If the value 1 is written to a bit here, the corresponding bit in [GPIO_STATUS_INTERRUPT](#) will be cleared. Recommended operation: use this register to clear [GPIO_STATUS_INTERRUPT](#). (WO)

Register 5.30. GPIO_STATUS1_W1TS_REG (0x0054)

GPIO_STATUS1_W1TS GPIO32 ~ 48 interrupt status set register. If the value 1 is written to a bit here, the corresponding bit in [GPIO_STATUS1_REG](#) will be set to 1. Recommended operation: use this register to set [GPIO_STATUS1_REG](#). (WO)

Register 5.31. GPIO_STATUS1_W1TC_REG (0x0058)

GPIO_STATUS1_W1TC GPIO32 ~ 48 interrupt status clear register. If the value 1 is written to a bit here, the corresponding bit in [GPIO_STATUS1_REG](#) will be cleared. Recommended operation: use this register to clear [GPIO_STATUS1_REG](#). (WO)

Register 5.32. GPIO_STATUS_NEXT_REG (0x014C)

GPIO_STATUS_INTERRUPT_NEXT Interrupt source signal of GPIO0 ~ 31, could be rising edge interrupt, falling edge interrupt, level sensitive interrupt and any edge interrupt. (RO)

Register 5.33. GPIO_STATUS_NEXT1_REG (0x0150)

GPIO_STATUS1_INTERRUPT_NEXT Interrupt source signal of GPIO32 ~ 48. (RO)

Register 5.34. GPIO_DATE_REG (0x06FC)

GPIO_DATE Version control register (R/W)

5.15.2 IO MUX Registers

The addresses in this section are relative to the IO MUX base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 5.35. IO_MUX_PIN_CTRL_REG (0x0000)

(reserved)																IO_MUX_PAD_POWER_CTRL		IO_MUX_SWITCH_PRT_NUM		IO_MUX_PIN_CTRL_CLK3		IO_MUX_PIN_CTRL_CLK2		IO_MUX_PIN_CTRL_CLK1		
31															16	15	14	12	11	8	7	4	3	0		
0x0																0x0	0x2	0x0		0x0		0x0		0x0		Reset

IO_MUX_PIN_CTRL_CLK_x If you want to output clock for I2S0 to: (R/W)

CLK_OUT1 then set IO_MUX_PIN_CTRL_CLK1 = 0x0

CLK_OUT2 then set IO_MUX_PIN_CTRL_CLK2 = 0x0;

CLK_OUT3 then set IO_MUX_PIN_CTRL_CLK3 = 0x0.

If you want to output clock for I2S1 to: (R/W)

CLK_OUT1 then set IO_MUX_PIN_CTRL_CLK1 = 0xF

CLK_OUT2 then set IO_MUX_PIN_CTRL_CLK2 = 0xF;

CLK_OUT3 then set IO_MUX_PIN_CTRL_CLK3 = 0xF.

Note:

Only the above mentioned combinations of clock source and clock output pins are possible.

The CLK_OUT1 ~ 3 can be found in [IO_MUX Pin Function List](#).

IO_MUX_SWITCH_PRT_NUM GPIO pin power switch delay, delay unit is one APB clock. (R/W)

IO_MUX_PAD_POWER_CTRL Select power voltage for GPIO33 ~ 37. 1: select VDD_SPI 1.8 V; 0: select VDD3P3_CPU 3.3 V. (R/W)

Register 5.36. IO_MUX_n_REG (n: GPIO0-GPIO21, GPIO26-GPIO48) (0x0010+4*n)

(reserved)																IO_MUX_FILTER_EN		IO_MUX_MCU_SEL		IO_MUX_FUN_DRV		IO_MUX_FUN_IE		IO_MUX_FUN_WPU		IO_MUX_FUN_WPD		(reserved)		IO_MUX_MCU_IE		IO_MUX_MCU_WPU		IO_MUX_MCU_WPD		IO_MUX_SLP_SEL		IO_MUX_MCU_OE	
31																16	15	14	12	11	10	9	8	7	6	5	4	3	2	1	0								
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0x0	0x0	0x2	0	0	0	00	0	0	0	0	0	0	0	Reset						

IO_MUX_MCU_OE Output enable of the pin in sleep mode. 1: Output enabled; 0: Output disabled. (R/W)

IO_MUX_SLP_SEL Sleep mode selection of this pin. Set to 1 to put the pin in sleep mode. (R/W)

IO_MUX_MCU_WPD Pull-down enable of the pin during sleep mode. 1: Internal pull-down enabled; 0: Internal pull-down disabled. (R/W)

IO_MUX_MCU_WPU Pull-up enable of the pin during sleep mode. 1: Internal pull-up enabled; 0: Internal pull-up disabled.

IO_MUX_MCU_IE Input enable of the pin during sleep mode. 1: Input enabled; 0: Input disabled. (R/W)

IO_MUX_FUN_WPD Pull-down enable of the pin. 1: Pull-down enabled; 0: Pull-down disabled. (R/W)

IO_MUX_FUN_WPU Pull-up enable of the pin. 1: Internal pull-up enabled; 0: Internal pull-up disabled. (R/W)

IO_MUX_FUN_IE Input enable of the pin. 1: Input enabled; 0: Input disabled. (R/W)

IO_MUX_FUN_DRV Select the drive strength of the pin. 0: ~5 mA; 1: ~10 mA; 2: ~20 mA; 3: ~40 mA. (R/W)

IO_MUX_MCU_SEL Select IO MUX function for this signal. 0: Select Function 0; 1: Select Function 1, etc. (R/W)

IO_MUX_FILTER_EN Enable filter for pin input signals. 1: Filter enabled; 2: Filter disabled. (R/W)

5.15.3 SDM Output Registers

The addresses in this section are relative to (GPIO base address provided in Table 3-3 in Chapter 3 *System and Memory* + 0x0F00).

Register 5.37. GPIO_SIGMADELTA_n_REG (*n*: 0-7) (0x0000+4n*)**

(reserved)																GPIO_SD _n _PRESCALE								GPIO_SD _n _IN										
31																16	15								8	7								0
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0																0xf								0x0								Reset		

GPIO_SD_n_IN This field is used to configure the duty cycle of sigma delta modulation output. (R/W)

GPIO_SD_n_PRESCALE This field is used to set a divider value to divide APB clock. (R/W)

Register 5.38. GPIO_SIGMADELTA_CG_REG (0x0020)

(reserved)																																
31																															0	
0 0																																Reset

GPIO_SD_CLK_EN Clock enable bit of configuration registers for sigma delta modulation. (R/W)

Register 5.39. GPIO_SIGMADELTA_MISC_REG (0x0024)

(reserved)																																
31	30	29																														0
0 0		0 0																													Reset	

GPIO_FUNCTION_CLK_EN Clock enable bit of sigma delta modulation. (R/W)

GPIO_SPI_SWAP Reserved. (R/W)

Register 5.40. GPIO_SD_SIGMADELTA_VERSION_REG (0x0028)

(reserved)				GPIO_SD_DATE																0
31	28	27																	0	
0	0	0	0	0x1802260																0

GPIO_SD_DATE Version control register. (R/W)

5.15.4 RTC IO MUX Registers

The addresses in this section are relative to (Low-Power Management base address provided in Table 3-3 in Chapter 3 *System and Memory* + 0x0400).

Register 5.41. RTC_GPIO_OUT_REG (0x0000)

RTC_GPIO_OUT_DATA										(reserved)												
31										10	9											0
0										0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0											0	

RTC_GPIO_OUT_DATA GPIO0 ~ 21 output register. Bit10 corresponds to GPIO0, bit11 corresponds to GPIO1, etc. (R/W)

Register 5.42. RTC_GPIO_OUT_W1TS_REG (0x0004)

RTC_GPIO_OUT_DATA_W1TS										(reserved)												
31										10	9											0
0										0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0											0	

RTC_GPIO_OUT_DATA_W1TS GPIO0 ~ 21 output set register. If the value 1 is written to a bit here, the corresponding bit in RTC_GPIO_OUT_REG will be set to 1. Recommended operation: use this register to set RTC_GPIO_OUT_REG. (WO)

Register 5.43. RTC_GPIO_OUT_W1TC_REG (0x0008)

<i>RTC_GPIO_OUT_DATA_W1TC</i>										<i>(reserved)</i>													
31											10	9											0
0										0 0 0 0 0 0 0 0 0 0 0 0										Reset			

RTC_GPIO_OUT_DATA_W1TC GPIO0 ~ 21 output clear register. If the value 1 is written to a bit here, the corresponding bit in RTC_GPIO_OUT_REG will be cleared. Recommended operation: use this register to clear RTC_GPIO_OUT_REG. (WO)

Register 5.44. RTC_GPIO_ENABLE_REG (0x000C)

<i>RTC_GPIO_ENABLE</i>										<i>(reserved)</i>													
31											10	9											0
0										0 0 0 0 0 0 0 0 0 0 0 0										Reset			

RTC_GPIO_ENABLE GPIO0 ~ 21 output enable. Bit10 corresponds to GPIO0, bit11 corresponds to GPIO1, etc. If the bit is set to 1, it means this GPIO pin is output. (R/W)

Register 5.45. RTC_GPIO_ENABLE_W1TS_REG (0x0010)

<i>RTC_GPIO_ENABLE_W1TS</i>										<i>(reserved)</i>													
31											10	9											0
0										0 0 0 0 0 0 0 0 0 0 0 0										Reset			

RTC_GPIO_ENABLE_W1TS GPIO0 ~ 21 output enable set register. If the value 1 is written to a bit here, the corresponding bit in RTC_GPIO_ENABLE_REG will be set to 1. Recommended operation: use this register to set RTC_GPIO_ENABLE_REG. (WO)

Register 5.46. RTC_GPIO_ENABLE_W1TC_REG (0x0014)

RTC_GPIO_ENABLE_W1TC										(reserved)													
31											10	9											0
0										0 0 0 0 0 0 0 0 0 0										0	Reset		

RTC_GPIO_ENABLE_W1TC GPIO0 ~ 21 output enable clear register. If the value 1 is written to a bit here, the corresponding bit in RTC_GPIO_ENABLE_REG will be cleared. Recommended operation: use this register to clear RTC_GPIO_ENABLE_REG. (WO)

Register 5.47. RTC_GPIO_STATUS_REG (0x0018)

RTC_GPIO_STATUS_INT										(reserved)													
31											10	9											0
0										0 0 0 0 0 0 0 0 0 0										0	Reset		

RTC_GPIO_STATUS_INT GPIO0 ~ 21 interrupt status register. Bit10 corresponds to GPIO0, bit11 corresponds to GPIO1, etc. This register should be used together with RTC_GPIO_PIN_n_INT_TYPE in RTC_GPIO_PIN_n_REG. 0: no interrupt; 1: corresponding interrupt. (R/W)

Register 5.48. RTC_GPIO_STATUS_W1TS_REG (0x001C)

RTC_GPIO_STATUS_INT_W1TS										(reserved)													
31											10	9											0
0										0 0 0 0 0 0 0 0 0 0										0	Reset		

RTC_GPIO_STATUS_INT_W1TS GPIO0 ~ 21 interrupt set register. If the value 1 is written to a bit here, the corresponding bit in RTC_GPIO_STATUS_INT will be set to 1. Recommended operation: use this register to set RTC_GPIO_STATUS_INT. (WO)

Register 5.49. RTC_GPIO_STATUS_W1TC_REG (0x0020)

RTC_GPIO_STATUS_INT_W1TC										(reserved)																				
31											10	9											0							
0										0 0 0 0 0 0 0 0 0 0										0										Reset

RTC_GPIO_STATUS_INT_W1TC GPIO0 ~ 21 interrupt clear register. If the value 1 is written to a bit here, the corresponding bit in RTC_GPIO_STATUS_INT will be cleared. Recommended operation: use this register to clear RTC_GPIO_STATUS_INT. (WO)

Register 5.50. RTC_GPIO_IN_REG (0x0024)

RTC_GPIO_IN_NEXT										(reserved)																				
31											10	9											0							
0										0 0 0 0 0 0 0 0 0 0										0										Reset

RTC_GPIO_IN_NEXT GPIO0 ~ 21 input value. Bit10 corresponds to GPIO0, bit11 corresponds to GPIO1, etc. Each bit represents a pin input value, 1 for high level, and 0 for low level. (RO)

Register 5.51. RTC_GPIO_PIN_n_REG (*n*: 0-21) (0x0028+0x4**n*)

(reserved)										RTC_GPIO_PIN _n _WAKEUP_ENABLE										RTC_GPIO_PIN _n _INT_TYPE										(reserved)										RTC_GPIO_PIN _n _PAD_DRIVER										
31											11	10	9											7	6											3	2	1	0											
0 0 0 0 0 0 0 0 0 0										0 0 0 0 0 0 0 0 0 0										0 0 0 0 0 0 0 0 0 0										0 0 0 0 0 0 0 0 0 0										0 0 0 0 0 0 0 0 0 0										Reset

RTC_GPIO_PIN_n_PAD_DRIVER Pin driver selection. 0: normal output; 1: open drain. (R/W)

RTC_GPIO_PIN_n_INT_TYPE GPIO interrupt type selection. 0: GPIO interrupt disabled; 1: rising edge trigger; 2: falling edge trigger; 3: any edge trigger; 4: low level trigger; 5: high level trigger. (R/W)

RTC_GPIO_PIN_n_WAKEUP_ENABLE GPIO wake-up enable. This will only wake up the chip from Light-sleep. (R/W)

Register 5.52. RTC_IO_TOUCH_PAD n _REG (n : 0-14) (0x0084+0x4* n)

(reserved)				RTC_IO_TOUCH_PAD n _DRV			RTC_IO_TOUCH_PAD n _RDE			RTC_IO_TOUCH_PAD n _RUE			(reserved)				RTC_IO_TOUCH_PAD n _START			RTC_IO_TOUCH_PAD n _TIE_OPT			RTC_IO_TOUCH_PAD n _XPD			RTC_IO_TOUCH_PAD n _MUX_SEL			RTC_IO_TOUCH_PAD n _FUN_SEL			RTC_IO_TOUCH_PAD n _SLP_SEL			RTC_IO_TOUCH_PAD n _SLP_IE			RTC_IO_TOUCH_PAD n _SLP_OE			RTC_IO_TOUCH_PAD n _FUN_IE			(reserved)			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	Reset															
0	2	1	0		0			0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0														

RTC_IO_TOUCH_PAD n _FUN_IE Input enable in normal execution. (R/W)

RTC_IO_TOUCH_PAD n _SLP_OE Output enable in sleep mode. (R/W)

RTC_IO_TOUCH_PAD n _SLP_IE Input enable in sleep mode. (R/W)

RTC_IO_TOUCH_PAD n _SLP_SEL 0: no sleep mode; 1: enable sleep mode. (R/W)

RTC_IO_TOUCH_PAD n _FUN_SEL Function selection. (R/W)

RTC_IO_TOUCH_PAD n _MUX_SEL Connect the RTC pin input or digital pin input. 0 is available, i.e. select digital pin input. (R/W)

RTC_IO_TOUCH_PAD n _XPD Touch sensor power on. (R/W)

RTC_IO_TOUCH_PAD n _TIE_OPT The tie option of touch sensor. 0: tie low; 1: tie high. (R/W)

RTC_IO_TOUCH_PAD n _START Start touch sensor. (R/W)

RTC_IO_TOUCH_PAD n _RUE Pull-up enable of the pin. 1: internal pull-up enabled; 0: internal pull-up disabled. (R/W)

RTC_IO_TOUCH_PAD n _RDE Pull-down enable of the pin. 1: internal pull-down enabled, 0: internal pull-down disabled. (R/W)

RTC_IO_TOUCH_PAD n _DRV Select the drive strength of the pin. 0: ~5 mA; 1: ~10 mA; 2: ~20 mA; 3: ~40 mA. (R/W)

Register 5.53. RTC_IO_XTAL_32P_PAD_REG (0x00C0)

(reserved)				RTC_IO_X32P_DRV				RTC_IO_X32P_RDE				RTC_IO_X32P_RUE				(reserved)				RTC_IO_X32P_MUX_SEL				RTC_IO_X32P_FUN_SEL				RTC_IO_X32P_SLP_SEL				RTC_IO_X32P_SLP_IE				RTC_IO_X32P_SLP_OE				(reserved)			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

0	0	0	0	0x1903170																											Reset

RTC_IO_DATE Version control register (R/W)

6 Reset and Clock

6.1 Reset

6.1.1 Overview

ESP32-S3 provides four reset levels, namely CPU Reset, Core Reset, System Reset, and Chip Reset.

All reset levels mentioned above (except Chip Reset) maintain the data stored in internal memory. Figure 6-1 shows the affected subsystems of the four reset levels.

6.1.2 Architectural Overview

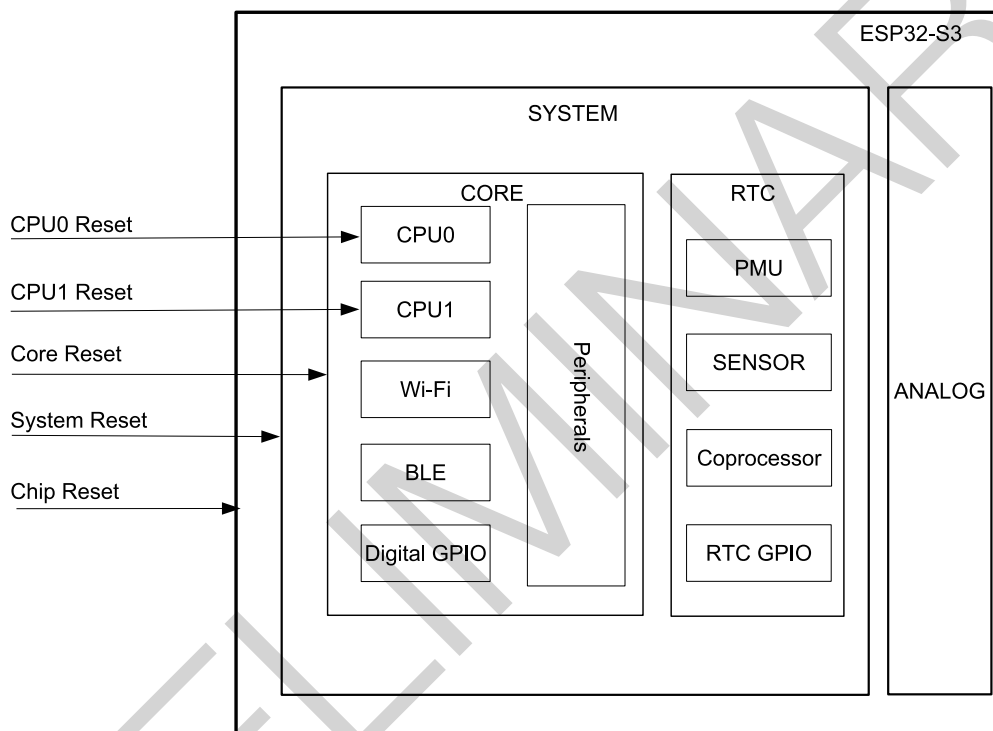

Figure 6-1. Reset Levels

6.1.3 Features

- Support four reset levels:
 - CPU Reset: only resets CPU x core. CPU x can be CPU0 or CPU1 here. Once such reset is released, programs will be executed from CPU x reset vector. Each CPU core has its own reset logic.
 - Core Reset: resets the whole digital system except RTC, including CPU0, CPU1, peripherals, Wi-Fi, Bluetooth[®] LE (BLE), and digital GPIOs.
 - System Reset: resets the whole digital system, including RTC.
 - Chip Reset: resets the whole chip.
- Support software reset and hardware reset:
 - Software reset is triggered by CPU x configuring its corresponding registers.

- Hardware reset is directly triggered by the circuit.

Note:

If CPU Reset is from CPU0, the [sensitive registers](#) will be reset, too.

6.1.4 Functional Description

CPU0 and CPU1 will be reset immediately when any of the reset above occurs. After the reset is released, CPU0 and CPU1 can read from the registers `RTC_CNTL_RESET_CAUSE_PROCPU` and `RTC_CNTL_RESET_CAUSE_APPCPU` to get the reset source, respectively. The reset sources recorded in the two registers are shared by the two CPUs, except the CPU reset sources, i.e. each CPU has its own CPU reset sources.

Table 6-1 lists the reset sources and the types of reset they trigger.

Table 6-1. Reset Sources

Code	Source	Reset Type	Comments
0x01	Chip reset ¹	Chip Reset	-
0x0F	Brown-out system reset	Chip Reset or System Reset	Triggered by brown-out detector ²
0x10	RWDT system reset	System Reset	See Chapter 11 <i>Watchdog Timers (WDT)</i>
0x12	Super Watchdog reset	System Reset	See Chapter 11 <i>Watchdog Timers (WDT)</i>
0x13	GLITCH reset	System Reset	See Chapter 22 <i>Clock Glitch Detection</i>
0x03	Software system reset	Core Reset	Triggered by configuring <code>RTC_CNTL_SW_SYS_RST</code>
0x05	Deep-sleep reset	Core Reset	See Chapter 5 <i>Low-Power Management (RTC_CNTL)</i> [to be added later]
0x07	MWDT0 core reset	Core Reset	See Chapter 11 <i>Watchdog Timers (WDT)</i>
0x08	MWDT1 core reset	Core Reset	See Chapter 11 <i>Watchdog Timers (WDT)</i>
0x09	RWDT core reset	Core Reset	See Chapter 11 <i>Watchdog Timers (WDT)</i>
0x14	eFuse reset	Core Reset	Triggered by eFuse CRC error
0x15	USB (UART) reset	Core Reset	Triggered when external USB host sends a specific command to the Serial interface of USB-Serial-JTAG. See 29 <i>USB Serial/JTAG Controller (USB_SERIAL_JTAG)</i>
0x16	USB (JTAG) reset	Core Reset	Triggered when external USB host sends a specific command to the JTAG interface of USB-Serial-JTAG. See 29 <i>USB Serial/JTAG Controller (USB_SERIAL_JTAG)</i>
0x0B	MWDT0 CPU _x reset	CPU Reset	See Chapter 11 <i>Watchdog Timers (WDT)</i>
0x0C	Software CPU _x reset	CPU Reset	Triggered by configuring <code>RTC_CNTL_SW_PRO(APP)CPU_RST</code>
0x0D	RWDT CPU _x reset	CPU Reset	See Chapter 11 <i>Watchdog Timers (WDT)</i>
0x11	MWDT1 CPU _x reset	CPU Reset	See Chapter 11 <i>Watchdog Timers (WDT)</i>

¹ Chip Reset can be triggered by the following three sources:

- Triggered by chip power-on;
- Triggered by brown-out detector;
- Triggered by Super Watchdog (SWD).

² Once brown-out status is detected, the detector will trigger System Reset or Chip Reset, depending on register configuration. For more information, please see Chapter 5 *Low-Power Management (RTC_CNTL)* [to be added later].

6.2 Clock

6.2.1 Overview

ESP32-S3 clocks are mainly sourced from oscillator (OSC), RC, and PLL circuit, and then processed by the dividers/selectors, which allows most functional modules to select their working clock according to their power consumption and performance requirements. Figure 6-2 shows the system clock structure.

6.2.2 Architectural Overview

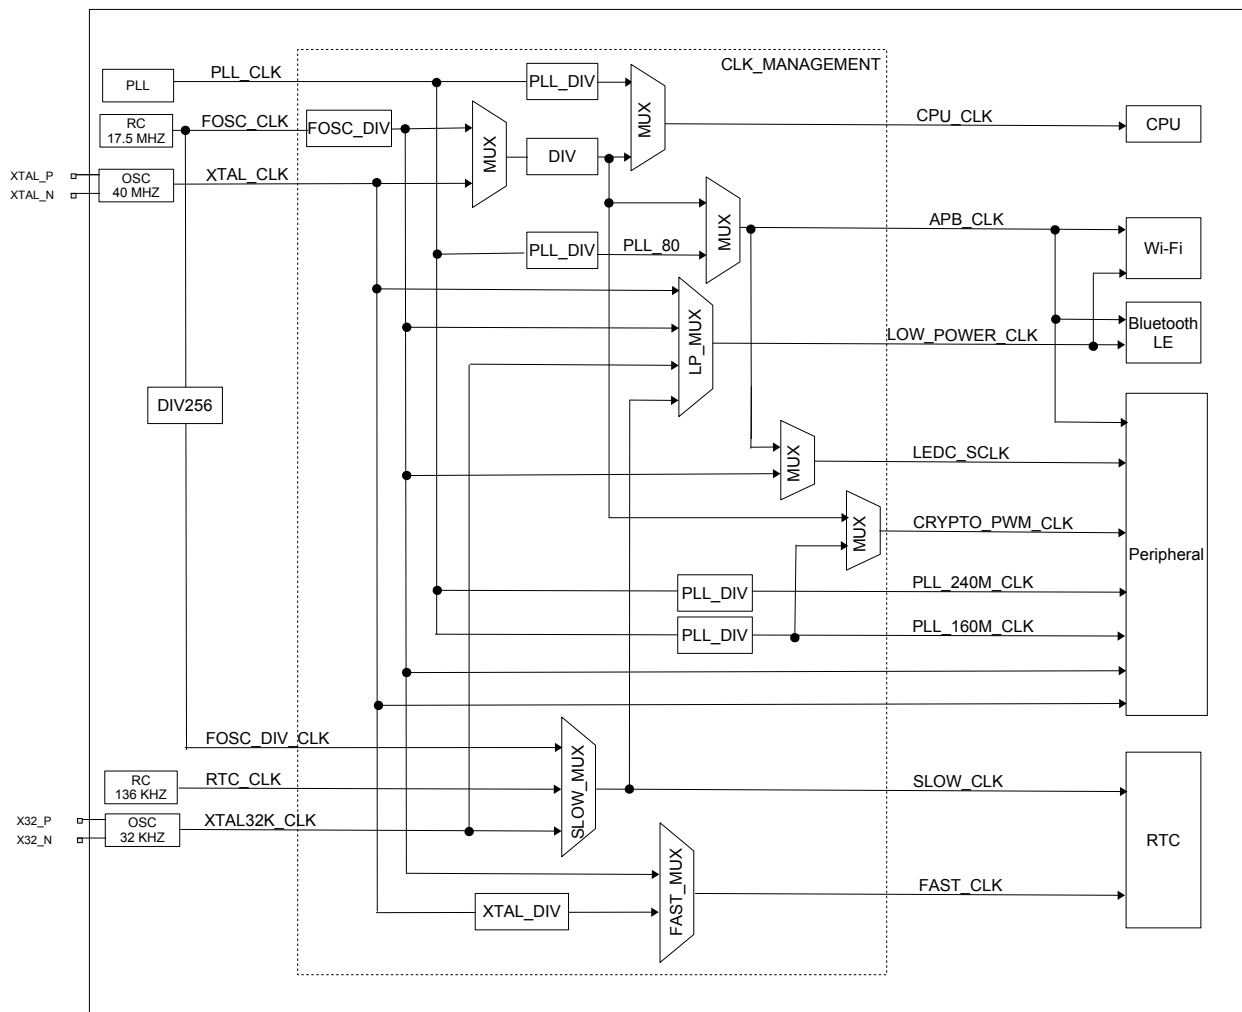

Figure 6-2. Clock Structure

6.2.3 Features

ESP32-S3 clocks can be classified in two types depending on their frequencies:

- High speed clocks for devices working at a higher frequency, such as CPU and digital peripherals
 - PLL_CLK (320 MHz or 480 MHz): internal PLL clock
 - XTAL_CLK (40 MHz): external crystal clock
- Slow speed clocks for low-power devices, such as RTC module and low-power peripherals

- XTAL32K_CLK (32 kHz): external crystal clock
- FOSC_CLK (17.5 MHz by default): internal fast RC oscillator clock with adjustable frequency
- FOSC_DIV_CLK: internal fast RC oscillator clock derived from FOSC_CLK divided by 256
- RTC_CLK (136 kHz by default): internal low RC oscillator clock with adjustable frequency

6.2.4 Functional Description

6.2.4.1 CPU Clock

As Figure 6-2 shows, CPU_CLK is the master clock for CPU_x and it can be as high as 240 MHz when CPU_x works in high performance mode. Alternatively, CPU_x can run at lower frequencies, such as at 2 MHz, to lower power consumption.

Users can set PLL_CLK, FOSC_CLK or XTAL_CLK as CPU_CLK clock source by configuring register SYSTEM_SOC_CLK_SEL, see Table 6-2 and Table 6-3. By default, the CPU clock is sourced from XTAL_CLK with a divider of 2, i.e. the CPU clock is 20 MHz.

Table 6-2. CPU Clock Source

SYSTEM_SOC_CLK_SEL Value	CPU Clock Source
0	XTAL_CLK
1	PLL_CLK
2	FOSC_CLK

Table 6-3. CPU Clock Frequency

CPU Clock Source	SEL_0*	SEL_1*	SEL_2*	CPU Clock Frequency
XTAL_CLK	0	-	-	CPU_CLK = XTAL_CLK/(SYSTEM_PRE_DIV_CNT + 1) SYSTEM_PRE_DIV_CNT ranges from 0 ~ 1023. Default is 1
PLL_CLK (480 MHz)	1	1	0	CPU_CLK = PLL_CLK/6 CPU_CLK frequency is 80 MHz
PLL_CLK (480 MHz)	1	1	1	CPU_CLK = PLL_CLK/3 CPU_CLK frequency is 160 MHz
PLL_CLK (480 MHz)	1	1	2	CPU_CLK = PLL_CLK/2 CPU_CLK frequency is 240 MHz
PLL_CLK (320 MHz)	1	0	0	CPU_CLK = PLL_CLK/4 CPU_CLK frequency is 80 MHz
PLL_CLK (320 MHz)	1	0	1	CPU_CLK = PLL_CLK/2 CPU_CLK frequency is 160 MHz
FOSC_CLK	2	-	-	CPU_CLK = FOSC_CLK/(SYSTEM_PRE_DIV_CNT + 1) SYSTEM_PRE_DIV_CNT ranges from 0 ~ 1023. Default is 1

* The value of register SYSTEM_SOC_CLK_SEL.

* The value of register SYSTEM_PLL_FREQ_SEL.

* The value of register SYSTEM_CPUPERIOD_SEL.

6.2.4.2 Peripheral Clocks

Peripheral clocks include APB_CLK, CRYPTO_PWM_CLK, PLL_160M_CLK, PLL_240M_CLK, LEDC_CLK, XTAL_CLK, and FOSC_CLK. Table 6-4 shows which clock can be used by each peripheral.

PRELIMINARY

Table 6-4. Peripheral Clocks

Peripheral	XTAL_CLK	APB_CLK	PLL_160M_CLK	PLL_240M_CLK	FOSC_CLK	CRYPTO_PWM_CLK	LEDC_CLK
TIMG	Y	Y					
I2S	Y		Y	Y			
UHCI		Y					
UART	Y	Y			Y		
RMT	Y	Y			Y		
PWM						Y	
I2C	Y				Y		
SPI	Y	Y					
PCNT		Y					
eFuse Controller		Y					
SARADC		Y		Y			
USB		Y					
CRYPTO						Y	
TWAI Controller		Y					
SDIO HOST	Y		Y				
LEDC	Y	Y			Y		Y
LCD_CAM	Y		Y	Y			
SYS_TIMER	Y	Y					

APB_CLK

APB_CLK frequency is determined by the clock source of CPU_CLK as shown in Table 6-5.

Table 6-5. APB_CLK Frequency

CPU_CLK Source	APB_CLK Frequency
PLL_CLK	80 MHz
XTAL_CLK	CPU_CLK
FOSC_CLK	CPU_CLK

CRYPTO_PWM_CLK

The frequency of CRYPTO_PWM_CLK is determined by the CPU_CLK source, as shown in Table 6-6.

Table 6-6. CRYPTO_PWM_CLK Frequency

CPU_CLK Source	CRYPTO_PWM_CLK Frequency
PLL_CLK	160 MHz
XTAL_CLK	CPU_CLK
FOSC_CLK	CPU_CLK

PLL_160M_CLK

PLL_160M_CLK is divided from PLL_CLK according to current PLL frequency.

PLL_240M_CLK

PLL_240M_CLK is divided from PLL_CLK according to current PLL frequency.

LEDC_CLK

LEDC module uses FOSC_CLK as clock source when APB_CLK is disabled. In other words, when the system is in low-power mode, most peripherals will be halted (APB_CLK is turned off), but LEDC can work normally via FOSC_CLK.

6.2.4.3 Wi-Fi and Bluetooth LE Clock

Wi-Fi and Bluetooth LE can work only when CPU_CLK uses PLL_CLK as its clock source. Suspending PLL_CLK requires that Wi-Fi and Bluetooth LE has entered low-power mode first.

LOW_POWER_CLK uses XTAL32K_CLK, XTAL_CLK, FOSC_CLK or SLOW_CLK (the low clock selected by RTC) as its clock source for Wi-Fi and Bluetooth LE in low-power mode.

6.2.4.4 RTC Clock

The clock sources for SLOW_CLK and FAST_CLK are low-frequency clocks. RTC module can operate when most other clocks are stopped.

SLOW_CLK is derived from RTC_CLK, XTAL32K_CLK or FOSC_DIV_CLK and used to clock Power Management module. FAST_CLK is used to clock On-chip Sensor module. It can be sourced from a divided XTAL_CLK or from FOSC_CLK.

7 Chip Boot Control

7.1 Overview

ESP32-S3 has four strapping pins:

- GPIO0
- GPIO3
- GPIO45
- GPIO46

These strapping pins are used to control the following functions during chip power-on or hardware reset:

- control chip boot mode
- enable or disable ROM code printing to UART
- control the voltage of VDD_SPI
- control the source of JTAG signals

During power-on-reset, RTC watchdog reset, brownout reset, analog super watchdog reset, and crystal clock glitch detection reset (see Chapter 6 *Reset and Clock*), hardware captures samples and stores the voltage level of strapping pins as strapping bit of “0” or “1” in latches, and holds these bits until the chip is powered down or shut down. Software can read the latch status (strapping value) from the register [GPIO_STRAPPING](#).

By default, GPIO0, GPIO45, and GPIO46 are connected to the chip’s internal pull-up/pull-down resistors. If these pins are not connected or connected to an external high-impedance circuit, the internal weak pull-up/pull-down determines the default input level of these strapping pins (see Table 7-1).

Table 7-1. Default Configuration of Strapping Pins

Strapping Pin	Default Configuration
GPIO0	Pull-up
GPIO3	N/A
GPIO45	Pull-down
GPIO46	Pull-down

To change the strapping bit values, users can apply external pull-down/pull-up resistors, or use host MCU GPIOs to control the voltage level of these pins when powering on ESP32-S3. After the reset is released, the strapping pins work as normal-function pins.

Note:

The following section provides description of the chip functions and the pattern of the strapping pins values to invoke each function. Only documented patterns should be used. If some pattern is not documented, it may trigger unexpected behavior.

7.2 Boot Mode Control

GPIO0 and GPIO46 control the boot mode after the reset is released.

Table 7-2. Boot Mode Control

Boot Mode	GPIO0	GPIO46
SPI Boot	1	x
Download Boot	0	0

Table 7-2 shows the strapping pin values of GPIO0 and GPIO46, and the associated boot modes. “x” means that this value is ignored. The ESP32-S3 chip only supports the two boot modes listed above. The strapping combination of GPIO0 = 0 and GPIO46 = 1 is not supported and will trigger unexpected behavior.

In SPI Boot mode, the CPU boots the system by reading the program stored in SPI flash. SPI Boot mode can be further classified as follows:

- Normal Flash Boot: supports Security Boot and programs run in RAM.
- Direct Boot: does not support Security Boot and programs run directly in flash. To enable this mode, make sure that the first two words of the bin file downloading to flash (address: 0x42000000) are 0xaedb041d.

In Download Boot mode, users can download code to flash using UART0 or USB interface. It is also possible to load a program into SRAM and execute it in this mode.

The following eFuses control boot mode behaviors:

- EFUSE_DIS_FORCE_DOWNLOAD

If this eFuse is 0 (default), software can force switch the chip from SPI Boot mode to Download Boot mode by setting register RTC_CNTL_FORCE_DOWNLOAD_BOOT and triggering a CPU reset. If this eFuse is 1, RTC_CNTL_FORCE_DOWNLOAD_BOOT is disabled.
- EFUSE_DIS_DOWNLOAD_MODE

If this eFuse is 1, Download Boot mode is disabled.
- EFUSE_ENABLE_SECURITY_DOWNLOAD

If this eFuse is 1, Download Boot mode only allows reading, writing, and erasing plaintext flash and does not support any SRAM or register operations. Ignore this eFuse if Download Boot mode is disabled.

USB Serial/JTAG Controller can also force the chip into Download Boot mode from SPI Boot mode, as well as force the chip into SPI Boot mode from Download Boot mode. For detailed information, please refer to Chapter 29 [USB Serial/JTAG Controller \(USB_SERIAL_JTAG\)](#).

7.3 ROM Code Printing Control

During the early boot process,

- if EFUSE_DIS_USB_DEVICE and EFUSE_DIS_USB are cleared, ROM code is always printed to USB Serial/JTAG controller.
- Otherwise, GPIO46 controls ROM code printing, together with EFUSE_UART_PRINT_CONTROL. See Table 7-3.

Table 7-3. ROM Code Printing Control

eFuse ¹	GPIO46	ROM Code Printing
0	x	ROM code is always printed to UART during boot. The value of GPIO46 is ignored.
1	0	Print is enabled during boot.
	1	Print is disabled during boot.
2	0	Print is disabled during boot.
	1	Print is enabled during boot.
3	x	Print is always disabled during boot. The value of GPIO46 is ignored.

¹ eFuse: EFUSE_UART_PRINT_CONTROL

If ROM code is printed to UART, U0TXD is used as the default pin. To print the ROM code to pin U1TXD, configure EFUSE_UART_PRINT_CHANNEL:

- 0: print to pin U0TXD
- 1: print to pin U1TXD

7.4 VDD_SPI Voltage Control

GPIO45 is used to select the VDD_SPI power supply voltage at reset:

- GPIO45 = 0, VDD_SPI pin is powered directly from VDD3P3_RTC via resistor R_{SPI} . Typically this voltage is 3.3 V. For more information, see Figure 4: ESP32-S3 Power Scheme in ESP32-S3 Datasheet.
- GPIO45 = 1, VDD_SPI pin is powered from internal 1.8 V LDO.

This functionality can be overridden by setting eFuse bit EFUSE_VDD_SPI_FORCE to 1, in which case the EFUSE_VDD_SPI_TIEH determines the VDD_SPI voltage:

- EFUSE_VDD_SPI_TIEH = 0, VDD_SPI connects to 1.8 V LDO.
- EFUSE_VDD_SPI_TIEH = 1, VDD_SPI connects to VDD3P3_RTC.

7.5 JTAG Signal Source Control

GPIO3 controls the source of JTAG signals during the early boot process. This GPIO is used together with EFUSE_DIS_PAD_JTAG, EFUSE_DIS_USB_JTAG, and EFUSE_STRAP_JTAG_SEL, see Table 7-4.

Table 7-4. JTAG Signal Source Control

eFuse 1 ^a	eFuse 2 ^b	eFuse 3 ^c	GPIO3	Signal Source
0	0	0	x	JTAG signals come from USB Serial/JTAG Controller. The value of GPIO3 is ignored.
		1	0	JTAG signals come from corresponding pins ^d
			1	JTAG signals come from USB Serial/JTAG Controller.
0	1	x	x	JTAG signals come from corresponding pins ^d . The values of EFUSE_STRAP_JTAG_SEL and GPIO3 are ignored.
1	0	x	x	JTAG signals come from USB Serial/JTAG Controller. The values of EFUSE_STRAP_JTAG_SEL and GPIO3 are ignored.
1	1	x	x	JTAG is disabled. The values of EFUSE_STRAP_JTAG_SEL and GPIO3 are ignored.

^a eFuse 1: EFUSE_DIS_PAD_JTAG

^b eFuse 2: EFUSE_DIS_USB_JTAG

^c eFuse 3: EFUSE_STRAP_JTAG_SEL

^d JTAG pins: MTDI, MTCK, MTMS, and MTDO.

8 Interrupt Matrix (INTERRUPT)

8.1 Overview

The interrupt matrix embedded in ESP32-S3 independently allocates peripheral interrupt sources to the two CPUs' peripheral interrupts, to timely inform CPU0 or CPU1 to process the interrupts once the interrupt signals are generated.

Peripheral interrupt sources must be routed to CPU0/CPU1 peripheral interrupts via this interrupt matrix due to the following considerations:

- ESP32-S3 has 99 peripheral interrupt sources. To map them to 32 CPU0 interrupts or 32 CPU1 interrupts, this matrix is needed.
- Through this matrix, one peripheral interrupt source can be mapped to multiple CPU0 interrupts or CPU1 interrupts according to application requirements.

8.2 Features

- Accept 99 peripheral interrupt sources as input
- Generate 26 peripheral interrupts to CPU0 and 26 peripheral interrupts to CPU1 as output. Note that the remaining six CPU0 interrupts and six CPU1 interrupts are internal interrupts.
- Support to disable CPU non-maskable interrupt (NMI) sources
- Support to query current interrupt status of peripheral interrupt sources

Figure 8-1 shows the structure of the interrupt matrix.

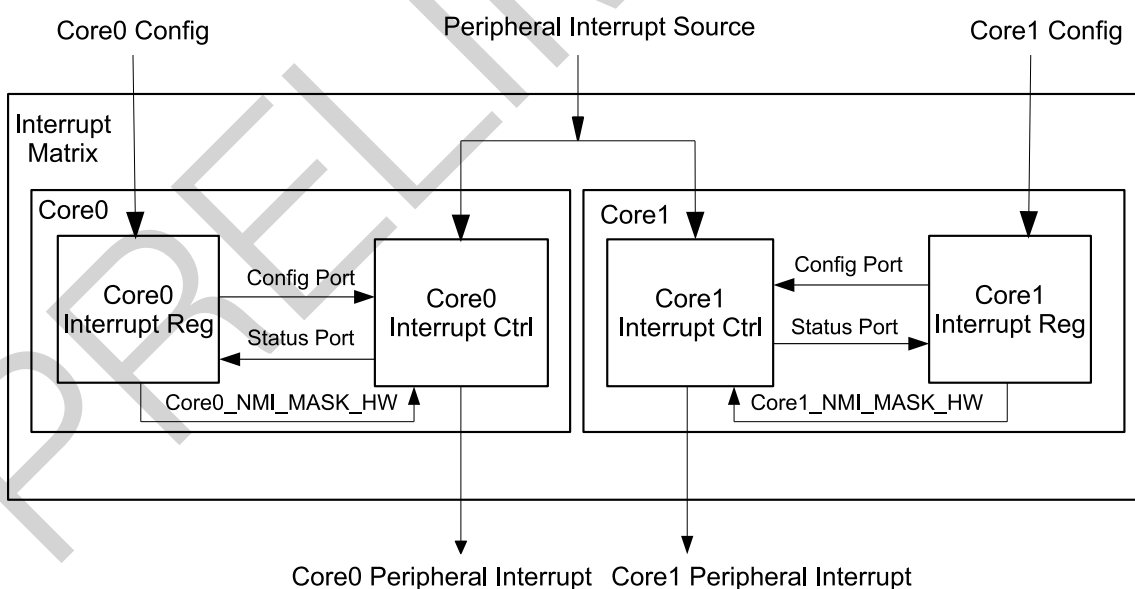

Figure 8-1. Interrupt Matrix Structure

All the interrupts generated by the peripheral interrupt sources can be handled by CPU0 or CPU1. Users can configure [CPU0 interrupt registers](#) (“Core0 Interrupt Reg” module in Figure 8-1) to allocate peripheral interrupt sources to CPU0, or configure [CPU1 interrupt registers](#) (“Core1 Interrupt Reg” module in Figure 8-1) to allocate

peripheral interrupt sources to CPU1. Peripheral interrupt sources can be allocated both to CPU0 and CPU1 simultaneously, if so, CPU0 and CPU1 will accept the interrupts.

8.3 Functional Description

8.3.1 Peripheral Interrupt Sources

ESP32-S3 has 99 peripheral interrupt sources in total. For the peripheral interrupt sources and their configuration/status registers, please refer to Table 8-1.

- Column “No.”: the peripheral interrupt source number, can be 0 ~ 98
- Column “Source”: all peripheral interrupt sources available
- Column “Configuration Register”: the registers used for routing the peripheral interrupt sources to CPU0/CPU1 peripheral interrupts
- Column “Status Register”: the registers used for indicating the interrupt status of peripheral interrupt sources
 - Column “Status Register - Bit”: the bit position in status registers
 - Column “Status Register - Name”: the name of status registers

The register in column “Configuration Register” and the bit in column “Bit” correspond to the peripheral interrupt source in column “Source”. For example, the configuration register for interrupt source MAC_INTR is `INTERRUPT_COREx_MAC_INTR_MAP_REG`, and its status bit in `INTERRUPT_COREx_INTR_STATUS_0_REG` is bit0.

Note that CORE_x in the table can be CORE0 (CPU0) or CORE1 (CPU1).

Table 8-1. CPU Peripheral Interrupt Configuration/Status Registers and Peripheral Interrupt Sources

No.	Source	Configuration Register		Status Register Name	
				Bit	
0	MAC_INTR	INTERRUPT_COREx_MAC_INTR_MAP_REG		0	INTERRUPT_COREx_INTR_STATUS_0_REG

8.3.2 CPU Interrupts

Each CPU has 32 interrupts, numbered from 0 ~ 31, including 26 peripheral interrupts and six internal interrupts.

- Peripheral interrupts: triggered by peripheral interrupt sources, include the following types:
 - Level-triggered interrupts: triggered by a high level signal. The interrupt sources should hold the level till the CPU_x handles the interrupts.
 - Edge-triggered interrupts: triggered on a rising edge. CPU_x responds to this kind of interrupts immediately.
 - NMI interrupt: once triggered, the NMI interrupt can not be masked by software using the CPU_x internal registers. World Controller provides a way to mask this kind of interrupt. For more information, see Chapter 14 *World Controller*.
- Internal interrupts: generated inside CPU_x, include the following types:
 - Timer interrupts: triggered by internal timers and are used to generate periodic interrupts.
 - Software interrupts: triggered when software writes to special registers.
 - Profiling interrupt: triggered for performance monitoring and analysis.

Level-triggered and edge-triggered both describe the ways of CPU_x to accept interrupt signals. For level-triggered interrupts, the level of interrupt signal should be kept till the CPU handles the interrupt, otherwise the interrupt may be lost. For edge-triggered interrupts, when a rising edge is detected, this edge will be recorded by CPU_x, which then allows the interrupt signal to be released.

Interrupt matrix routes the peripheral interrupt sources to any of the CPU_x peripheral interrupts. By such way, CPU_x can receive the interrupt signals from peripheral interrupt sources. Table 8-2 lists all the interrupts and their types as well as priorities.

ESP32-S3 supports the above-mentioned 32 interrupts at six levels as shown in the table below. A higher level corresponds to a higher priority. NMI has the highest interrupt priority and once triggered, the CPU_x must handle such interrupt. Nested interrupts are also supported, i.e. low-level interrupts can be stopped by high-level interrupts.

Table 8-2. CPU Interrupts

No.	Category	Type	Priority
0	Peripheral	Level-triggered	1
1	Peripheral	Level-triggered	1
2	Peripheral	Level-triggered	1
3	Peripheral	Level-triggered	1
4	Peripheral	Level-triggered	1
5	Peripheral	Level-triggered	1
6	Internal	Timer.0	1
7	Internal	Software	1
8	Peripheral	Level-triggered	1
9	Peripheral	Level-triggered	1

27	Peripheral	Level-triggered	3
28	Peripheral	Level-triggered	4
29	Internal	Software	3
30	Peripheral	Level-triggered	4
31	Peripheral	Level-triggered	5

8.3.3 Allocate Peripheral Interrupt Source to CPU_x Interrupt

In this section, the following terms are used to describe the operation of the interrupt matrix.

- Source_Y: stands for a peripheral interrupt source, wherein, *Y* means the number of this interrupt source in Table 8-1.
- INTERRUPT_CORE_x_SOURCE_Y_MAP_REG: stands for a configuration register for the peripheral interrupt source (Source_Y) of CPU_x.
- Interrupt_P: stands for the CPU_x peripheral interrupt numbered as Num_P. The value of Num_P can be 0 ~ 5, 8 ~ 10, 12 ~ 14, 17 ~ 28, and 30 ~ 31. See Table 8-2.
- Interrupt_I: stands for the CPU_x internal interrupt numbered as Num_I. The value of Num_I can be 6, 7, 11, 15, 16, and 29. See Table 8-2.

8.3.3.1 Allocate one peripheral interrupt source (Source_Y) to CPU_x

Setting the corresponding configuration register INTERRUPT_CORE_x_SOURCE_Y_MAP_REG of Source_Y to Num

_P allocates this interrupt source to Interrupt_P. Num_P here can be any value from 0 ~ 5, 8 ~ 10, 12 ~ 14, 17 ~ 28, and 30 ~ 31. Note that one CPU_x interrupt can be shared by multiple peripherals.

8.3.3.2 Allocate multiple peripheral interrupt sources (Source_{Yn}) to CPU_x

Setting the corresponding configuration register `INTERRUPT_COREx_SOURCE_Yn_MAP_REG` of each interrupt source to the same Num_P allocates multiple sources to the same Interrupt_P. Any of these sources can trigger CPU_x Interrupt_P. When an interrupt signal is generated, CPU_x checks the interrupt status registers to figure out which peripheral the signal comes from.

8.3.3.3 Disable CPU_x peripheral interrupt source (Source_Y)

Setting the corresponding configuration register `INTERRUPT_COREx_SOURCE_Y_MAP_REG` of the source to any Num_I disables this interrupt Source_Y. The choice of Num_I (6, 7, 11, 15, 16, 29) does not matter, as none of peripheral interrupt sources allocated to Num_I is connected to the CPU_x. Therefore this functionality can be used to disable peripheral interrupt sources.

8.3.4 Disable CPU_x NMI Interrupt

All CPU_x interrupts, except for NMI interrupt (No.14 in Table 8-2), can be masked and enabled by software using CPU special register (INTENABLE). NMI interrupt can not be masked by the way above, but ESP32-S3 provides two ways to mask NMI interrupt:

- Disconnect peripheral interrupt sources from NMI interrupt, i.e. the sources routed to NMI interrupt before are now routed to other interrupts. By such way, the previous NMI interrupt is maskable.
- Connect peripheral interrupt sources with NMI interrupt, but use World Controller module to mask NMI interrupt. For more information, see Chapter Chapter 14 *World Controller*.

8.3.5 Query Current Interrupt Status of Peripheral Interrupt Source

Users can query current interrupt status of a CPU_x peripheral interrupt source by reading the bit value in `INTERRUPT_COREx_INTR_STATUS_n_REG` (read only). For the mapping between `INTERRUPT_COREx_INTR_STATUS_n_REG` and peripheral interrupt sources, please refer to Table 8-1.

8.4 Register Summary

The addresses in this section are relative to the Interrupt Matrix base address provided in Table 3-3 in Chapter 3 *System and Memory*.

8.4.1 CPU0 Interrupt Register Summary

Name	Description	Address	Access
Configuration Registers			
INTERRUPT_CORE0_MAC_INTR_MAP_REG	MAC interrupt configuration register	0x0000	R/W
INTERRUPT_CORE0_MAC_NMI_MAP_REG	MAC_NMI interrupt configuration register	0x0004	R/W
INTERRUPT_CORE0_PWR_INTR_MAP_REG	PWR interrupt configuration register	0x0008	R/W
INTERRUPT_CORE0_BB_INT_MAP_REG	BB interrupt configuration register	0x000C	R/W
INTERRUPT_CORE0_BT_MAC_INT_MAP_REG	BT_MAC interrupt configuration register	0x0010	R/W
INTERRUPT_CORE0_BT_BB_INT_MAP_REG	BT_BB interrupt configuration register	0x0014	R/W
INTERRUPT_CORE0_BT_BB_NMI_MAP_REG	BT_BB_NMI interrupt configuration register	0x0018	R/W
INTERRUPT_CORE0_RWBT_IRQ_MAP_REG	RWBT_IRQ interrupt configuration register	0x001C	R/W
INTERRUPT_CORE0_RWBLE_IRQ_MAP_REG	RWBLE_IRQ interrupt configuration register	0x0020	R/W
INTERRUPT_CORE0_RWBT_NMI_MAP_REG	RWBT_NMI interrupt configuration register	0x0024	R/W
INTERRUPT_CORE0_RWBLE_NMI_MAP_REG	RWBLE_NMI interrupt configuration register	0x0028	R/W
INTERRUPT_CORE0_I2C_MST_INT_MAP_REG	I2C_MST interrupt configuration register	0x002C	R/W
INTERRUPT_CORE0_UHCI0_INTR_MAP_REG	UHCI0 interrupt configuration register	0x0038	R/W
INTERRUPT_CORE0_GPIO_INTERRUPT_CPU_MAP_REG	GPIO_INTERRUPT_CPU interrupt configuration register	0x0040	R/W
INTERRUPT_CORE0_GPIO_INTERRUPT_CPU_NMI_MAP_REG	GPIO_INTERRUPT_CPU_NMI interrupt configuration register	0x0044	R/W
INTERRUPT_CORE0_SPI_INTR_1_MAP_REG	SPI_INTR_1 interrupt configuration register	0x0050	R/W
INTERRUPT_CORE0_SPI_INTR_2_MAP_REG	SPI_INTR_2 interrupt configuration register	0x0054	R/W
INTERRUPT_CORE0_SPI_INTR_3_MAP_REG	SPI_INTR_3 interrupt configuration register	0x0058	R/W
INTERRUPT_CORE0_LCD_CAM_INT_MAP_REG	LCD_CAM interrupt configuration register	0x0060	R/W

INTERRUPT_CORE0_SYSTIMER_TARGET0_INT_MAP_REG	SYSTIMER_TARGET0 interrupt configuration register	0x00E4	R/W
INTERRUPT_CORE0_SYSTIMER_TARGET1_INT_MAP_REG	SYSTIMER_TARGET1 interrupt configuration register	0x00E8	R/W
INTERRUPT_CORE0_SYSTIMER_TARGET2_INT_MAP_REG	SYSTIMER_TARGET2 interrupt configuration register	0x00EC	R/W
INTERRUPT_CORE0_SPI_MEM_REJECT_INTR_MAP_REG	SPI_MEM_REJECT interrupt configuration register	0x00F0	R/W
INTERRUPT_CORE0_DCACHE_PRELOAD_INT_MAP_REG	DCACHE_PRELOAD interrupt configuration register	0x00F4	R/W
INTERRUPT_CORE0_ICACHE_PRELOAD_INT_MAP_REG	ICACHE_PRELOAD interrupt configuration register	0x00F8	R/W
INTERRUPT_CORE0_DCACHE_SYNC_INT_MAP_REG	DCACHE_SYNC interrupt configuration register	0x00FC	R/W
INTERRUPT_CORE0_ICACHE_SYNC_INT_MAP_REG	ICACHE_SYNC interrupt configuration register	0x0100	R/W
INTERRUPT_CORE0_APB_ADC_INT_MAP_REG	APB_ADC interrupt configuration register	0x0104	R/W
INTERRUPT_CORE0_DMA_IN_CH0_INT_MAP_REG	DMA_IN_CH0 interrupt configuration register	0x0108	R/W
INTERRUPT_CORE0_DMA_IN_CH1_INT_MAP_REG	DMA_IN_CH1 interrupt configuration register	0x010C	R/W
INTERRUPT_CORE0_DMA_IN_CH2_INT_MAP_REG	DMA_IN_CH2 interrupt configuration register	0x0110	R/W

Name	Description	Address	Access
INTERRUPT_CORE0_DMA_IN_CH3_INT_MAP_REG	DMA_IN_CH3 interrupt configuration register	0x0114	R/W
INTERRUPT_CORE0_DMA_IN_CH4_INT_MAP_REG	DMA_IN_CH4 interrupt configuration register	0x0118	R/W
INTERRUPT_CORE0_DMA_OUT_CH0_INT_MAP_REG	DMA_OUT_CH0 interrupt configuration register	0x011C	R/W
INTERRUPT_CORE0_DMA_OUT_CH1_INT_MAP_REG	DMA_OUT_CH1 interrupt configuration register	0x0120	R/W
INTERRUPT_CORE0_DMA_OUT_CH2_INT_MAP_REG	DMA_OUT_CH2 interrupt configuration register	0x0124	R/W
INTERRUPT_CORE0_DMA_OUT_CH3_INT_MAP_REG	DMA_OUT_CH3 interrupt configuration register	0x0128	R/W
INTERRUPT_CORE0_DMA_OUT_CH4_INT_MAP_REG	DMA_OUT_CH4 interrupt configuration register	0x012C	R/W
INTERRUPT_CORE0_RSA_INT_MAP_REG	RSA interrupt configuration register	0x0130	R/W
INTERRUPT_CORE0_AES_INT_MAP_REG	AES interrupt configuration register	0x0134	R/W
INTERRUPT_CORE0_SHA_INT_MAP_REG	SHA interrupt configuration register	0x0138	R/W
INTERRUPT_CORE0_CPU_INTR_FROM_CPU_0_MAP_REG	CPU_INTR_FROM_CPU_0 interrupt configuration register	0x013C	R/W
INTERRUPT_CORE0_CPU_INTR_FROM_CPU_1_MAP_REG	CPU_INTR_FROM_CPU_1 interrupt configuration register	0x0140	R/W
INTERRUPT_CORE0_CPU_INTR_FROM_CPU_2_MAP_REG	CPU_INTR_FROM_CPU_2 interrupt configuration register	0x0144	R/W
INTERRUPT_CORE0_CPU_INTR_FROM_CPU_3_MAP_REG	CPU_INTR_FROM_CPU_3 interrupt configuration register	0x0148	R/W
INTERRUPT_CORE0_ASSIST_DEBUG_INTR_MAP_REG	ASSIST_DEBUG interrupt configuration register	0x014C	R/W
INTERRUPT_CORE0_DMA_APBPERI_PMS_MONITOR_VIOLATE_INTR_MAP_REG	dma_pms_monitor_volatile interrupt configuration register	0x0150	R/W
INTERRUPT_CORE0_CORE_0_IRAM0_PMS_MONITOR_VIOLATE_INTR_MAP_REG	core0_IRam0_pms_monitor_volatile interrupt configuration register	0x0154	R/W
INTERRUPT_CORE0_CORE_0_DRAM0_PMS_MONITOR_VIOLATE_INTR_MAP_REG	core0_DRam0_pms_monitor_volatile interrupt configuration register	0x0158	R/W
INTERRUPT_CORE0_CORE_0_PIF_PMS_MONITOR_VIOLATE_INTR_MAP_REG	core0_PIF_pms_monitor_volatile interrupt configuration register	0x015C	R/W
INTERRUPT_CORE0_CORE_0_PIF_PMS_MONITOR_VIOLATE_SIZE_INTR_MAP_REG	core0_PIF_pms_monitor_volatile_size interrupt configuration register	0x0160	R/W
INTERRUPT_CORE0_CORE_1_IRAM0_PMS_MONITOR_VIOLATE_INTR_MAP_REG	core1_IRam0_pms_monitor_volatile interrupt configuration register	0x0164	R/W
INTERRUPT_CORE0_CORE_1_DRAM0_PMS_MONITOR_VIOLATE_INTR_MAP_REG	core1_DRam0_pms_monitor_volatile interrupt configuration register	0x0168	R/W

Name	Description	Address	Access
INTERRUPT_CORE0_CORE_1_PIF_PMS_MONITOR_VIOLATE_INTR_MAP_REG	core1_PIF_pms_monitor_violatile interrupt configuration register	0x016C	R/W
INTERRUPT_CORE0_CORE_1_PIF_PMS_MONITOR_VIOLATE_SIZE_INTR_MAP_REG	core1_PIF_pms_monitor_violatile_size interrupt configuration register	0x0170	R/W
INTERRUPT_CORE0_BACKUP_PMS_VIOLATE_INTR_MAP_REG	BACKUP_PMS_MONITOR_VIOLATILE interrupt configuration register	0x0174	R/W
INTERRUPT_CORE0_CACHE_CORE0_ACS_INT_MAP_REG	CACHE_CORE0_ACS interrupt configuration register	0x0178	R/W
INTERRUPT_CORE0_CACHE_CORE1_ACS_INT_MAP_REG	CACHE_CORE1_ACS interrupt configuration register	0x017C	R/W
INTERRUPT_CORE0_USB_DEVICE_INT_MAP_REG	USB_DEVICE interrupt configuration register	0x0180	R/W
INTERRUPT_CORE0_PERI_BACKUP_INT_MAP_REG	PERI_BACKUP interrupt configuration register	0x0184	R/W
INTERRUPT_CORE0_DMA_EXTMEM_REJECT_INT_MAP_REG	DMA_EXTMEM_REJECT interrupt configuration register	0x0188	R/W
Status Registers			
INTERRUPT_CORE0_INTR_STATUS_0_REG	Interrupt status register	0x018C	RO
INTERRUPT_CORE0_INTR_STATUS_1_REG	Interrupt status register	0x0190	RO
INTERRUPT_CORE0_INTR_STATUS_2_REG	Interrupt status register	0x0194	RO
INTERRUPT_CORE0_INTR_STATUS_3_REG	Interrupt status register	0x0198	RO
Clock Register			
INTERRUPT_CORE0_CLOCK_GATE_REG	Clock gate register	0x019C	R/W
Version Register			
INTERRUPT_CORE0_DATE_REG	Version control register	0x07FC	R/W

8.4.2 CPU1 Interrupt Register Summary

Name	Description	Address	Access
Configuration Registers			
INTERRUPT_CORE1_MAC_INTR_MAP_REG	MAC interrupt configuration register	0x0800	R/W
INTERRUPT_CORE1_MAC_NMI_MAP_REG	MAC_NMI interrupt configuration register	0x0804	R/W
INTERRUPT_CORE1_PWR_INTR_MAP_REG	PWR interrupt configuration register	0x0808	R/W
INTERRUPT_CORE1_BB_INT_MAP_REG	BB interrupt configuration register	0x080C	R/W

Name	Description	Address	Access
INTERRUPT_CORE1_BT_MAC_INT_MAP_REG	BB_MAC interrupt configuration register	0x0810	R/W
INTERRUPT_CORE1_BT_BB_INT_MAP_REG	BT_BB interrupt configuration register	0x0814	R/W
INTERRUPT_CORE1_BT_BB_NMI_MAP_REG	BT_BB_NMI interrupt configuration register	0x0818	R/W
INTERRUPT_CORE1_RWBT_IRQ_MAP_REG	RWBT_IRQ interrupt configuration register	0x081C	R/W
INTERRUPT_CORE1_RWBLE_IRQ_MAP_REG	RWBLE_IRQ interrupt configuration register	0x0820	R/W
INTERRUPT_CORE1_RWBT_NMI_MAP_REG	RWBT_NMI interrupt configuration register	0x0824	R/W
INTERRUPT_CORE1_RWBLE_NMI_MAP_REG	RWBLE_NMI interrupt configuration register	0x0828	R/W
INTERRUPT_CORE1_I2C_MST_INT_MAP_REG	I2C_MST interrupt configuration register	0x082C	R/W
INTERRUPT_CORE1_UHCI0_INTR_MAP_REG	UHCI0 interrupt configuration register	0x0838	R/W
INTERRUPT_CORE1_GPIO_INTERRUPT_CPU_MAP_REG	GPIO_INTERRUPT_CPU interrupt configuration register	0x0840	R/W
INTERRUPT_CORE1_GPIO_INTERRUPT_CPU_NMI_MAP_REG	GPIO_INTERRUPT_CPU_NMI Interrupt configuration register	0x0844	R/W
INTERRUPT_CORE1_SPI_INTR_1_MAP_REG	SPI_INTR_1 interrupt configuration register	0x0850	R/W
INTERRUPT_CORE1_SPI_INTR_2_MAP_REG	SPI_INTR_2 interrupt configuration register	0x0854	R/W
INTERRUPT_CORE1_SPI_INTR_3_MAP_REG	SPI_INTR_3 interrupt configuration register	0x0858	R/W
INTERRUPT_CORE1_LCD_CAM_INT_MAP_REG	LCD_CAM interrupt configuration register	0x0860	R/W
INTERRUPT_CORE1_I2S0_INT_MAP_REG	I2S0 interrupt configuration register	0x0864	R/W
INTERRUPT_CORE1_I2S1_INT_MAP_REG	I2S1 interrupt configuration register	0x0868	R/W
INTERRUPT_CORE1_UART_INTR_MAP_REG	UART interrupt configuration register	0x086C	R/W
INTERRUPT_CORE1_UART1_INTR_MAP_REG	UART1 interrupt configuration register	0x0870	R/W
INTERRUPT_CORE1_UART2_INTR_MAP_REG	UART2 interrupt configuration register	0x0874	R/W
INTERRUPT_CORE1_SDIO_HOST_INTERRUPT_MAP_REG	SDIO_HOST interrupt configuration register	0x0878	R/W
INTERRUPT_CORE1_PWM0_INTR_MAP_REG	PWM0 interrupt configuration register	0x087C	R/W
INTERRUPT_CORE1_PWM1_INTR_MAP_REG	PWM1 interrupt configuration register	0x0880	R/W
INTERRUPT_CORE1_LEDC_INT_MAP_REG	LEDC interrupt configuration register	0x088C	R/W
INTERRUPT_CORE1_EFUSE_INT_MAP_REG	EFUSE interrupt configuration register	0x0890	R/W
INTERRUPT_CORE1_CAN_INT_MAP_REG	CAN interrupt configuration register	0x0894	R/W
INTERRUPT_CORE1_USB_INTR_MAP_REG	USB interrupt configuration register	0x0898	R/W
INTERRUPT_CORE1_RTC_CORE_INTR_MAP_REG	RTC_CORE interrupt configuration register	0x089C	R/W
INTERRUPT_CORE1_RMT_INTR_MAP_REG	RMT interrupt configuration register	0x08A0	R/W

Name	Description	Address	Access
INTERRUPT_CORE1_PCNT_INTR_MAP_REG	PCNT interrupt configuration register	0x08A4	R/W
INTERRUPT_CORE1_I2C_EXT0_INTR_MAP_REG	I2C_EXT0 interrupt configuration register	0x08A8	R/W
INTERRUPT_CORE1_I2C_EXT1_INTR_MAP_REG	I2C_EXT1 interrupt configuration register	0x08AC	R/W
INTERRUPT_CORE1_TG_T1_INT_MAP_REG	TG_T1 interrupt configuration register	0x08CC	R/W
INTERRUPT_CORE1_TG_WDT_INT_MAP_REG	TG_WDT interrupt configuration register	0x08D0	R/W
INTERRUPT_CORE1_TG1_T0_INT_MAP_REG	TG1_T0 interrupt configuration register	0x08D4	R/W
INTERRUPT_CORE1_TG1_T1_INT_MAP_REG	TG1_T1 interrupt configuration register	0x08D8	R/W
INTERRUPT_CORE1_TG1_WDT_INT_MAP_REG	TG1_WDT interrupt configuration register	0x08DC	R/W
INTERRUPT_CORE1_CACHE_IA_INT_MAP_REG	CACHE_IA interrupt configuration register	0x08E0	R/W
INTERRUPT_CORE1_SYSTIMER_TARGET0_INT_MAP_REG	SYSTIMER_TARGET0 interrupt configuration register	0x08E4	R/W
INTERRUPT_CORE1_SYSTIMER_TARGET1_INT_MAP_REG	SYSTIMER_TARGET1 interrupt configuration register	0x08E8	R/W
INTERRUPT_CORE1_SYSTIMER_TARGET2_INT_MAP_REG	SYSTIMER_TARGET2 interrupt configuration register	0x08EC	R/W
INTERRUPT_CORE1_SPI_MEM_REJECT_INTR_MAP_REG	SPI_MEM_REJECT interrupt configuration register	0x08F0	R/W
INTERRUPT_CORE1_DCACHE_PRELOAD_INT_MAP_REG	DCACHE_PRELOAD interrupt configuration register	0x08F4	R/W
INTERRUPT_CORE1_ICACHE_PRELOAD_INT_MAP_REG	ICACHE_PRELOAD interrupt configuration register	0x08F8	R/W
INTERRUPT_CORE1_DCACHE_SYNC_INT_MAP_REG	DCACHE_SYNC interrupt configuration register	0x08FC	R/W
INTERRUPT_CORE1_ICACHE_SYNC_INT_MAP_REG	ICACHE_SYNC interrupt configuration register	0x0900	R/W
INTERRUPT_CORE1_APB_ADC_INT_MAP_REG	APB_ADC interrupt configuration register	0x0904	R/W
INTERRUPT_CORE1_DMA_IN_CH0_INT_MAP_REG	DMA_IN_CH0 interrupt configuration register	0x0908	R/W
INTERRUPT_CORE1_DMA_IN_CH1_INT_MAP_REG	DMA_IN_CH1 interrupt configuration register	0x090C	R/W
INTERRUPT_CORE1_DMA_IN_CH2_INT_MAP_REG	DMA_IN_CH2 interrupt configuration register	0x0910	R/W
INTERRUPT_CORE1_DMA_IN_CH3_INT_MAP_REG	DMA_IN_CH3 interrupt configuration register	0x0914	R/W
INTERRUPT_CORE1_DMA_IN_CH4_INT_MAP_REG	DMA_IN_CH4 interrupt configuration register	0x0918	R/W
INTERRUPT_CORE1_DMA_OUT_CH0_INT_MAP_REG	DMA_OUT_CH0 interrupt configuration register	0x091C	R/W
INTERRUPT_CORE1_DMA_OUT_CH1_INT_MAP_REG	DMA_OUT_CH1 interrupt configuration register	0x0920	R/W
INTERRUPT_CORE1_DMA_OUT_CH2_INT_MAP_REG	DMA_OUT_CH2 interrupt configuration register	0x0924	R/W
INTERRUPT_CORE1_DMA_OUT_CH3_INT_MAP_REG	DMA_OUT_CH3 interrupt configuration register	0x0928	R/W
INTERRUPT_CORE1_DMA_OUT_CH4_INT_MAP_REG	DMA_OUT_CH4 interrupt configuration register	0x092C	R/W
INTERRUPT_CORE1_RSA_INT_MAP_REG	RSA interrupt configuration register	0x0930	R/W

Name	Description	Address	Access
INTERRUPT_CORE1_AES_INT_MAP_REG	AES interrupt configuration register	0x0934	R/W
INTERRUPT_CORE1_SHA_INT_MAP_REG	SHA interrupt configuration register	0x0938	R/W
INTERRUPT_CORE1_CPU_INTR_FROM_CPU_0_MAP_REG	CPU_INTR_FROM_CPU_0 interrupt configuration register	0x093C	R/W
INTERRUPT_CORE1_CPU_INTR_FROM_CPU_1_MAP_REG	CPU_INTR_FROM_CPU_1 interrupt configuration register	0x0940	R/W
INTERRUPT_CORE1_CPU_INTR_FROM_CPU_2_MAP_REG	CPU_INTR_FROM_CPU_2 interrupt configuration register	0x0944	R/W
INTERRUPT_CORE1_CPU_INTR_FROM_CPU_3_MAP_REG	CPU_INTR_FROM_CPU_3 interrupt configuration register	0x0948	R/W
INTERRUPT_CORE1_ASSIST_DEBUG_INTR_MAP_REG	ASSIST_DEBUG interrupt configuration register	0x094C	R/W
INTERRUPT_CORE1_DMA_APBPERI_PMS_MONITOR_VIOLATE_INTR_MAP_REG	dma_pms_monitor_violatile interrupt configuration register	0x0950	R/W
INTERRUPT_CORE1_CORE_0_IRAM0_PMS_MONITOR_VIOLATE_INTR_MAP_REG	core0_IRam0_pms_monitor_violatile interrupt configuration register	0x0954	R/W
INTERRUPT_CORE1_CORE_0_DRAM0_PMS_MONITOR_VIOLATE_INTR_MAP_REG	core0_DRam0_pms_monitor_violatile interrupt configuration register	0x0958	R/W
INTERRUPT_CORE1_CORE_0_PIF_PMS_MONITOR_VIOLATE_INTR_MAP_REG	core0_PIF_pms_monitor_violatile interrupt configuration register	0x095C	R/W
INTERRUPT_CORE1_CORE_0_PIF_PMS_MONITOR_VIOLATE_SIZE_INTR_MAP_REG	core0_PIF_pms_monitor_violatile_size interrupt configuration register	0x0960	R/W
INTERRUPT_CORE1_CORE_1_IRAM0_PMS_MONITOR_VIOLATE_INTR_MAP_REG	core1_IRam0_pms_monitor_violatile interrupt configuration register	0x0964	R/W
INTERRUPT_CORE1_CORE_1_DRAM0_PMS_MONITOR_VIOLATE_INTR_MAP_REG	core1_DRam0_pms_monitor_violatile interrupt configuration register	0x0968	R/W
INTERRUPT_CORE1_CORE_1_PIF_PMS_MONITOR_VIOLATE_INTR_MAP_REG	core1_PIF_pms_monitor_violatile interrupt configuration register	0x096C	R/W
INTERRUPT_CORE1_CORE_1_PIF_PMS_MONITOR_VIOLATE_SIZE_INTR_MAP_REG	core1_PIF_pms_monitor_violatile_size interrupt configuration register	0x0970	R/W
INTERRUPT_CORE1_BACKUP_PMS_VIOLATE_INTR_MAP_REG	BACKUP_PMS_MONITOR_VIOLATILE interrupt configuration register	0x0974	R/W
INTERRUPT_CORE1_CACHE_CORE0_ACS_INT_MAP_REG	CACHE_CORE0_ACS interrupt configuration register REG	0x0978	R/W
INTERRUPT_CORE1_CACHE_CORE1_ACS_INT_MAP_REG	CACHE_CORE1_ACS interrupt configuration register REG	0x097C	R/W

Name	Description	Address	Access
INTERRUPT_CORE1_USB_DEVICE_INT_MAP_REG	USB_DEVICE interrupt configuration register	0x0980	R/W
INTERRUPT_CORE1_PERI_BACKUP_INT_MAP_REG	PERI_BACKUP interrupt configuration register	0x0984	R/W
INTERRUPT_CORE1_DMA_EXTMEM_REJECT_INT_MAP_REG	DMA_EXTMEM_REJECT interrupt configuration register	0x0988	R/W
Status Registers			
INTERRUPT_CORE1_INTR_STATUS_0_REG	Interrupt status register	0x098C	RO
INTERRUPT_CORE1_INTR_STATUS_1_REG	Interrupt status register	0x0990	RO

9 System Timer (SYSTIMER)

9.1 Overview

ESP32-S3 provides a 52-bit timer, which can be used to generate tick interrupts for operating system, or be used as a general timer to generate periodic interrupts or one-time interrupts. With the help of RTC timer, system timer can account for the period of the ESP32-S3 being in Light-sleep or Deep-sleep.

The timer consists of two counters UNIT0 and UNIT1. The counter values can be monitored by three comparators COMP0, COMP1 and COMP2. See the timer block diagram on Figure 9-1.

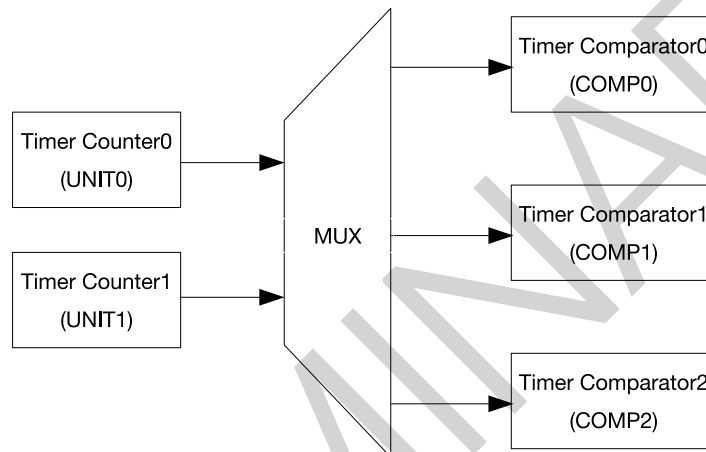

Figure 9-1. System Timer Structure

9.2 Features

- Consist of two 52-bit counters and three 52-bit comparators
- Software accessing registers is clocked by APB_CLK
- Use CNT_CLK for counting, with an average frequency of 16 MHz in two counting cycles
- Use 40 MHz XTAL_CLK as the clock source of CNT_CLK
- Support for 52-bit alarm values (t) and 26-bit alarm periods (δt)
- Provide two modes to generate alarms:
 - Target mode: only a one-time alarm is generated based on the alarm value (t)
 - Period mode: periodic alarms are generated based on the alarm period (δt)
- Three comparators can generate three independent interrupts based on configured alarm value (t) or alarm period (δt)
- Load back sleep time recorded by RTC timer via software after Deep-sleep or Light-sleep
- Can be configured to stall or continue running when CPU stalls or enters on-chip-debugging mode

9.3 Clock Source Selection

The counters and comparators are driven using XTAL_CLK. After scaled by a fractional divider, a $f_{XTAL_CLK}/3$ clock is generated in one count cycle and a $f_{XTAL_CLK}/2$ clock in another count cycle. The average clock frequency is $f_{XTAL_CLK}/2.5$, which is 16 MHz, i.e. the CNT_CLK in Figure 9-2. The timer counting is incremented by $1/16 \mu s$ on each CNT_CLK cycle.

Software operation such as configuring registers is clocked by APB_CLK. For more information about APB_CLK, see Chapter 6 *Reset and Clock*.

The following two bits of system registers are also used to control the system timer:

- SYSTEM_SYSTIMER_CLK_EN in register SYSTEM_PERIP_CLK_EN0_REG: enable APB_CLK signal to system timer.
- SYSTEM_SYSTIMER_RST in register SYSTEM_PERIP_RST_EN0_REG: reset system timer.

Note that if the timer is reset, its registers will be restored to their default values. For more information, please refer to Table Peripheral Clock Gating and Reset in Chapter 15 *System Registers*.

9.4 Functional Description

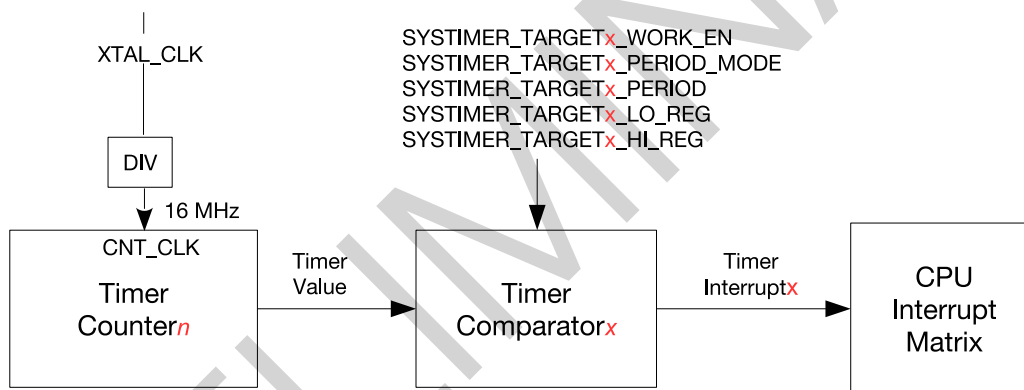

Figure 9-2. System Timer Alarms

Figure 9-2 shows the procedure to generate alarm/interrupt in system timer. In this process, one timer counter and one timer comparator are used. An alarm interrupt will be generated accordingly based on the comparison result in comparator.

9.4.1 Counter

The system timer has two 52-bit timer counters, shown as UNIT n ($n = 0$ or 1). Their counting clock source is a 16 MHz clock, i.e. CNT_CLK. Whether UNIT n works or not is controlled by three bits in register SYSTIMER_CONF_REG:

- SYSTIMER_TIMER_UNIT n _WORK_EN: set this bit to enable the counter UNIT n in system timer.
- SYSTIMER_TIMER_UNIT n _CORE0_STALL_EN: if this bit is set, the counter UNIT n stops counting when CPU0 is stalled. The counter continues its counting after the CPU0 resumes.
- SYSTIMER_TIMER_UNIT n _CORE1_STALL_EN: if this bit is set, the counter UNIT n stops counting when CPU1 is stalled. The counter continues its counting after the CPU1 resumes.

The configuration of the three bits to control the counter $UNIT_n$ is shown below, assuming that CPU0 and CPU1 both are stalled.

Table 9-1. $UNIT_n$ Configuration Bits

SYSTIMER_TIMER_ $UNIT_n$ _WORK_EN	SYSTIMER_TIMER_ $UNIT_n$ _CORE0_STALL_EN	SYSTIMER_TIMER_ $UNIT_n$ _CORE1_STALL_EN	Counter $UNIT_n$
0	x*	x	Not at work
1	x	1	Stop counting, but will continue its counting after CPU1 resumes.
1	1	x	Stop counting, but will continue its counting after CPU0 resumes.
1	0	0	Keep counting

* x: Don't-care.

When the counter $UNIT_n$ is at work, the count value is incremented on each counting cycle. When the counter $UNIT_n$ is stopped or stalled, the count value stops increasing and keeps unchanged.

The low 32 bits and high 20 bits of initial count value are loaded from `SYSTIMER_TIMER_UNIT n _LOAD_LO` and `SYSTIMER_TIMER_UNIT n _LOAD_HI`. Writing 1 to the bit `SYSTIMER_TIMER_UNIT n _LOAD` will trigger a reload event, and the current count value will be changed immediately. If $UNIT_n$ is at work, the counter will continue to count up from the new reloaded value.

Writing 1 to `SYSTIMER_TIMER_UNIT n _UPDATE` will trigger an update event. The low 32 bits and high 20 bits of current count value will be locked into `SYSTIMER_TIMER_UNIT n _VALUE_LO` and `SYSTIMER_TIMER_UNIT n _VALUE_HI`, and then `SYSTIMER_TIMER_UNIT n _VALUE_VALID` is asserted. Before the next update event, the values of `SYSTIMER_TIMER_UNIT n _VALUE_LO` and `SYSTIMER_TIMER_UNIT n _VALUE_HI` remain unchanged.

9.4.2 Comparator and Alarm

The system timer has three 52-bit comparators, shown as $COMP_x$ ($x = 0, 1, \text{ or } 2$). The comparators can generate independent interrupts based on different alarm values (t) or alarm periods (δt).

Configure `SYSTIMER_TARGET x _PERIOD_MODE` to choose from the two alarm modes for each $COMP_x$:

- 1: select period mode
- 0: select target mode

In period mode, the alarm period (δt) is provided by the register `SYSTIMER_TARGET x _PERIOD`. Assuming that current count value is t_1 , when it reaches $(t_1 + \delta t)$, an alarm interrupt will be generated. Another alarm interrupt also will be generated when the counter value reaches $(t_1 + 2 * \delta t)$. By such way, periodic alarms are generated.

In target mode, the low 32 bits and high 20 bits of the alarm value (t) are provided by `SYSTIMER_TIMER_TARGET x _LO` and `SYSTIMER_TIMER_TARGET x _HI`. Assuming that current count value is t_2 ($t_2 \leq t$), an alarm interrupt will be generated when the count value reaches the alarm value (t). Unlike in period mode, only one alarm interrupt is generated in target mode.

`SYSTIMER_TARGETxTIMER_UNIT_SEL` is used to choose the count value from which timer counter to be compared for alarm:

- 1: use the count value from UNIT₁
- 0: use the count value from UNIT₀

Finally, set `SYSTIMER_TARGETxWORK_EN` and `COMPx` starts to compare the count value with the alarm value (t) in target mode or with the alarm period ($t_1 + n \cdot \delta t$) in period mode.

An alarm is generated when the count value equals to the alarm value (t) in target mode or to the start value($t_1 + n \cdot \text{alarm period } \delta t$ ($n = 1, 2, 3, \dots$)) in period mode. But if the alarm value (t) set in registers is less than current count value, i.e. the target has already passed, or current count value is larger than the real target value within a range ($0 \sim 2^{51} - 1$), an alarm interrupt also is generated immediately. The relationship between current count value t_c , the alarm value t_t and alarm trigger point is shown below. No matter in target mode or period mode, the low 32 bits and high 20 bits of the real target value can always be read from `SYSTIMER_TARGETxLO_RO` and `SYSTIMER_TARGETxHI_RO`.

Table 9-2. Trigger Point

Relationship Between t_c and t_t	Trigger Point
$t_c - t_t \leq 0$	$t_c = t_t$, an alarm is triggered.
$0 \leq t_c - t_t < 2^{51} - 1$ ($t_c < 2^{51}$ and $t_t < 2^{51}$, or $t_c \geq 2^{51}$ and $t_t \geq 2^{51}$)	An alarm is triggered immediately.
$t_c - t_t \geq 2^{51} - 1$	t_c overflows after counting to its maximum value $52'h\text{ffffffffffff}$, and then starts counting up from 0. When its value reaches t_t , an alarm is triggered.

9.4.3 Synchronization Operation

The clock APB_CLK is used in software operation, while timer counters and comparators are working on CNT_CLK. Synchronization is needed for some configuration registers. A complete synchronization action takes two steps:

1. Software writes suitable values to configuration fields, see the first column in Table 9-3.
2. Software writes 1 to corresponding bits to start synchronization, see the second column in Table 9-3.

Table 9-3. Synchronization Operation

Configuration Fields	Synchronization Enable Bit
<code>SYSTIMER_TIMER_UNIT_nLOAD_LO</code> <code>SYSTIMER_TIMER_UNIT_nLOAD_HI</code>	<code>SYSTIMER_TIMER_UNIT_nLOAD</code>
<code>SYSTIMER_TARGET_xPERIOD</code> <code>SYSTIMER_TIMER_TARGET_xHI</code> <code>SYSTIMER_TIMER_TARGET_xLO</code>	<code>SYSTIMER_TIMER_COMP_xLOAD</code>

9.4.4 Interrupt

Each comparator has one level-triggered alarm interrupt, named as SYSTIMER_TARGET x _INT. Interrupt signal is asserted high when the comparator starts to alarm. Until the interrupt is cleared by software, it remains high. To enable interrupts, set the bit SYSTIMER_TARGET x _INT_ENA.

9.5 Programming Procedure

9.5.1 Read Current Count Value

1. Set SYSTIMER_TIMER_UNIT n _UPDATE to update the current count value into SYSTIMER_TIMER_UNIT n _VALUE_HI and SYSTIMER_TIMER_UNIT n _VALUE_LO.
2. Poll the reading of SYSTIMER_TIMER_UNIT n _VALUE_VALID, till it's 1, which means user now can read the count values from SYSTIMER_TIMER_UNIT n _VALUE_HI and SYSTIMER_TIMER_UNIT n _VALUE_LO.
3. Read the low 32 bits and high 20 bits from SYSTIMER_TIMER_UNIT n _VALUE_LO and SYSTIMER_TIMER_UNIT n _VALUE_HI.

9.5.2 Configure One-Time Alarm in Target Mode

1. Set SYSTIMER_TARGET x _TIMER_UNIT_SEL to select the counter (UNIT0 or UNIT1) used for COMP x .
2. Read current count value, see Section 9.5.1. This value will be used to calculate the alarm value (t) in Step 4.
3. Clear SYSTIMER_TARGET x _PERIOD_MODE to enable target mode.
4. Set an alarm value (t), and fill its low 32 bits to SYSTIMER_TIMER_TARGET x _LO, and the high 20 bits to SYSTIMER_TIMER_TARGET x _HI.
5. Set SYSTIMER_TIMER_COMP x _LOAD to synchronize the alarm value to COMP x , i.e. load the alarm value (t) to the COMP x .
6. Set SYSTIMER_TARGET x _WORK_EN to enable the selected COMP x . COMP x starts comparing the count value with the alarm value (t).
7. Set SYSTIMER_TARGET x _INT_ENA to enable timer interrupt. When Unit n counts to the alarm value (t), a SYSTIMER_TARGET x _INT interrupt is triggered.

9.5.3 Configure Periodic Alarms in Period Mode

1. Set SYSTIMER_TARGET x _TIMER_UNIT_SEL to select the counter (UNIT0 or UNIT1) used for COMP x .
2. Set a alarm period (δt), and fill it to SYSTIMER_TARGET x _PERIOD.
3. Set SYSTIMER_TIMER_COMP x _LOAD to synchronize the alarm period (δt) to COMP x , i.e. load the alarm period (δt) to COMP x .
4. Set SYSTIMER_TARGET x _PERIOD_MODE to configure COMP x into period mode.
5. Set SYSTIMER_TARGET x _WORK_EN to enable the selected COMP x . COMP x starts comparing the count value with the sum of start value + $n * \delta t$ ($n = 1, 2, 3 \dots$).
6. Set SYSTIMER_TARGET x _INT_ENA to enable timer interrupt. A SYSTIMER_TARGET x _INT interrupt is triggered when Unit n counts to start value + $n * \delta t$ ($n = 1, 2, 3 \dots$) set in step 2.

9.5.4 Update After Deep-sleep and Light-sleep

1. Configure RTC timer before the chip goes to Deep-sleep or Light-sleep, to record the exact sleep time. For more information, see Chapter 5 *Low-Power Management (RTC_CNTL)* [to be added later].
2. Read the sleep time from RTC timer when the chip is woken up from Deep-sleep or Light-sleep.
3. Read current count value of system timer, see Section 9.5.1.
4. Convert the time value recorded by RTC timer from the clock cycles based on RTC_SLOW_CLK to that based on 16 MHz CNT_CLK. For example, if the frequency of RTC_SLOW_CLK is 32 KHz, the recorded RTC timer value should be converted by multiplying by 500.
5. Add the converted RTC value to current count value of system timer:
 - Fill the new value into SYSTIMER_TIMER_UNIT n _LOAD_LO (low 32 bits) and SYSTIMER_TIMER_UNIT n _LOAD_HI (high 20 bits).
 - Set SYSTIMER_TIMER_UNIT n _LOAD to load new timer value into system timer. By such way, the system timer is updated.

9.6 Register Summary

The addresses in this section are relative to system timer base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
Clock Control Register			
SYSTIMER_CONF_REG	Configure system timer clock	0x0000	R/W
UNIT0 Control and Configuration Registers			
SYSTIMER_UNIT0_OP_REG	Read UNIT0 value to registers	0x0004	varies
SYSTIMER_UNIT0_LOAD_HI_REG	High 20 bits to be loaded to UNIT0	0x000C	R/W
SYSTIMER_UNIT0_LOAD_LO_REG	Low 32 bits to be loaded to UNIT0	0x0010	R/W
SYSTIMER_UNIT0_VALUE_HI_REG	UNIT0 value, high 20 bits	0x0040	RO
SYSTIMER_UNIT0_VALUE_LO_REG	UNIT0 value, low 32 bits	0x0044	RO
SYSTIMER_UNIT0_LOAD_REG	UNIT0 synchronization register	0x005C	WT
UNIT1 Control and Configuration Registers			
SYSTIMER_UNIT1_OP_REG	Read UNIT1 value to registers	0x0008	varies
SYSTIMER_UNIT1_LOAD_HI_REG	High 20 bits to be loaded to UNIT1	0x0014	R/W
SYSTIMER_UNIT1_LOAD_LO_REG	Low 32 bits to be loaded to UNIT1	0x0018	R/W
SYSTIMER_UNIT1_VALUE_HI_REG	UNIT1 value, high 20 bits	0x0048	RO
SYSTIMER_UNIT1_VALUE_LO_REG	UNIT1 value, low 32 bits	0x004C	RO
SYSTIMER_UNIT1_LOAD_REG	UNIT1 synchronization register	0x0060	WT
Comparator0 Control and Configuration Registers			
SYSTIMER_TARGET0_HI_REG	Alarm value to be loaded to COMP0, high 20 bits	0x001C	R/W

Register 9.5. SYSTIMER_UNIT0_VALUE_HI_REG (0x0040)

SYSTIMER_TIMER_UNIT0_VALUE_HI UNIT0 read value, high 20 bits. (RO)

Register 9.6. SYSTIMER_UNIT0_VALUE_LO_REG (0x0044)

SYSTIMER_TIMER_UNIT0_VALUE_LO UNIT0 read value, low 32 bits. (RO)

Register 9.7. SYSTIMER_UNIT0_LOAD_REG (0x005C)

SYSTIMER_TIMER_UNIT0_LOAD UNIT0 synchronization enable signal. Set this bit to reload the values of SYSTIMER_TIMER_UNIT0_LOAD_HI and SYSTIMER_TIMER_UNIT0_LOAD_LO to UNIT0. (WT)

Register 9.8. SYSTIMER_UNIT1_OP_REG (0x0008)

SYSTIMER_TIMER_UNIT1_VALUE_VALID UNIT1 value is synchronized and valid. (R/SS/WTC)

SYSTIMER_TIMER_UNIT1_UPDATE Update timer UNIT1, i.e. read the UNIT1 count value to SYSTIMER_TIMER_UNIT1_VALUE_HI and SYSTIMER_TIMER_UNIT1_VALUE_LO. (WT)

Register 9.9. SYSTIMER_UNIT1_LOAD_HI_REG (0x0014)

SYSTIMER_TIMER_UNIT1_LOAD_HI The value to be loaded to UNIT1, high 20 bits. (R/W)

Register 9.10. SYSTIMER_UNIT1_LOAD_LO_REG (0x0018)

SYSTIMER_TIMER_UNIT1_LOAD_LO The value to be loaded to UNIT1, low 32 bits. (R/W)

Register 9.11. SYSTIMER_UNIT1_VALUE_HI_REG (0x0048)

SYSTIMER_TIMER_UNIT1_VALUE_HI UNIT1 read value, high 20 bits. (RO)

Register 9.12. SYSTIMER_UNIT1_VALUE_LO_REG (0x004C)

SYSTIMER_TIMER_UNIT1_VALUE_LO UNIT1 read value, low 32 bits. (RO)

Register 9.13. SYSTIMER_UNIT1_LOAD_REG (0x0060)

SYSTIMER_TIMER_UNIT1_LOAD UNIT1 synchronization enable signal. Set this bit to reload the values of SYSTIMER_TIMER_UNIT1_LOAD_HI and SYSTIMER_TIMER_UNIT1_LOAD_LO to UNIT1. (WT)

Register 9.14. SYSTIMER_TARGET0_HI_REG (0x001C)

SYSTIMER_TIMER_TARGET0_HI The alarm value to be loaded to COMP0, high 20 bits. (R/W)

Register 9.15. SYSTIMER_TARGET0_LO_REG (0x0020)

SYSTIMER_TIMER_TARGET0_LO The alarm value to be loaded to COMP0, low 32 bits. (R/W)

Register 9.16. SYSTIMER_TARGET0_CONF_REG (0x0034)

SYSTIMER_TARGET0_PERIOD COMP0 alarm period. (R/W)

SYSTIMER_TARGET0_PERIOD_MODE Set COMP0 to period mode. (R/W)

SYSTIMER_TARGET0_TIMER_UNIT_SEL Select which counter unit to compare for COMP0. (R/W)

Register 9.17. SYSTIMER_COMP0_LOAD_REG (0x0050)

SYSTIMER_TIMER_COMP0_LOAD COMP0 synchronization enable signal. Set this bit to reload the alarm value/period to COMP0. (WT)

Register 9.18. SYSTIMER_TARGET1_HI_REG (0x0024)

SYSTIMER_TIMER_TARGET1_HI The alarm value to be loaded to COMP1, high 20 bits. (R/W)

Register 9.19. SYSTIMER_TARGET1_LO_REG (0x0028)

SYSTIMER_TIMER_TARGET1_LO The alarm value to be loaded to COMP1, low 32 bits. (R/W)

Register 9.23. SYSTIMER_TARGET2_LO_REG (0x0030)

SYSTIMER_TIMER_TARGET2_LO The alarm value to be loaded to COMP2, low 32 bits. (R/W)

Register 9.24. SYSTIMER_TARGET2_CONF_REG (0x003C)

SYSTIMER_TARGET2_PERIOD COMP2 alarm period. (R/W)

SYSTIMER_TARGET2_PERIOD_MODE Set COMP2 to period mode. (R/W)

SYSTIMER_TARGET2_TIMER_UNIT_SEL Select which counter unit to compare for COMP2. (R/W)

Register 9.25. SYSTIMER_COMP2_LOAD_REG (0x0058)

SYSTIMER_TIMER_COMP2_LOAD COMP2 synchronization enable signal. Set this bit to reload the alarm value/period to COMP2. (WT)

Register 9.26. SYSTIMER_INT_ENA_REG (0x0064)

SYSTIMER_TARGET0_INT_ENA SYSTIMER_TARGET0_INT enable bit. (R/W)

SYSTIMER_TARGET1_INT_ENA SYSTIMER_TARGET1_INT enable bit. (R/W)

SYSTIMER_TARGET2_INT_ENA SYSTIMER_TARGET2_INT enable bit. (R/W)

Register 9.27. SYSTIMER_INT_RAW_REG (0x0068)

SYSTIMER_TARGET0_INT_RAW SYSTIMER_TARGET0_INT raw bit. (R/WTC/SS)

SYSTIMER_TARGET1_INT_RAW SYSTIMER_TARGET1_INT raw bit. (R/WTC/SS)

SYSTIMER_TARGET2_INT_RAW SYSTIMER_TARGET2_INT raw bit. (R/WTC/SS)

Register 9.28. SYSTIMER_INT_CLR_REG (0x006C)

SYSTIMER_TARGET0_INT_CLR SYSTIMER_TARGET0_INT clear bit. (WT)

SYSTIMER_TARGET1_INT_CLR SYSTIMER_TARGET1_INT clear bit. (WT)

SYSTIMER_TARGET2_INT_CLR SYSTIMER_TARGET2_INT clear bit. (WT)

Register 9.29. SYSTIMER_INT_ST_REG (0x0070)

SYSTIMER_TARGET0_INT_ST SYSTIMER_TARGET0_INT status bit. (RO)

SYSTIMER_TARGET1_INT_ST SYSTIMER_TARGET1_INT status bit. (RO)

SYSTIMER_TARGET2_INT_ST SYSTIMER_TARGET2_INT status bit. (RO)

Register 9.30. SYSTIMER_REAL_TARGET0_LO_REG (0x0074)

SYSTIMER_TARGET0_LO_RO Actual target value of COMP0, low 32 bits. (RO)

Register 9.31. SYSTIMER_REAL_TARGET0_HI_REG (0x0078)

SYSTIMER_TARGET0_HI_RO Actual target value of COMP0, high 20 bits. (RO)

Register 9.32. SYSTIMER_REAL_TARGET1_LO_REG (0x007C)

SYSTIMER_TARGET1_LO_RO Actual target value of COMP1, low 32 bits. (RO)

Register 9.33. SYSTIMER_REAL_TARGET1_HI_REG (0x0080)

SYSTIMER_TARGET1_HI_RO Actual target value of COMP1, high 20 bits. (RO)

Register 9.34. SYSTIMER_REAL_TARGET2_LO_REG (0x0084)

SYSTIMER_TARGET2_LO_RO Actual target value of COMP2, low 32 bits. (RO)

Register 9.35. SYSTIMER_REAL_TARGET2_HI_REG (0x0088)

SYSTIMER_TARGET2_HI_RO Actual target value of COMP2, high 20 bits. (RO)

Register 9.36. SYSTIMER_DATE_REG (0x00FC)

SYSTIMER_DATE Version control register. (R/W)

10 Timer Group (TIMG)

10.1 Overview

General purpose timers can be used to precisely time an interval, trigger an interrupt after a particular interval (periodically and aperiodically), or act as a hardware clock. As shown in Figure 10-1, the ESP32-S3 chip contains two timer groups, namely timer group 0 and timer group 1. Each timer group consists of two general purpose timers referred to as T_x (where x is 0 or 1) and one Main System Watchdog Timer. All general purpose timers are based on 16-bit prescalers and 54-bit auto-reload-capable up-down counters.

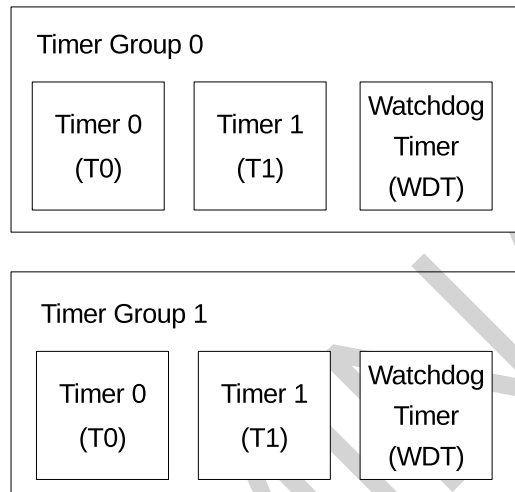

Figure 10-1. Timer Units within Groups

Note that while the Main System Watchdog Timer registers are described in this chapter, their functional description is included in the Chapter 11 *Watchdog Timers (WDT)*. Therefore, the term ‘timers’ within this chapter refers to the general purpose timers.

The timers’ features are summarized as follows:

- A 16-bit clock prescaler, from 2 to 65536
- A 54-bit time-base counter programmable to incrementing or decrementing
- Able to read real-time value of the time-base counter
- Halting and resuming the time-base counter
- Programmable alarm generation
- Timer value reload (Auto-reload at alarm or software-controlled instant reload)
- Level interrupt generation

10.2 Functional Description

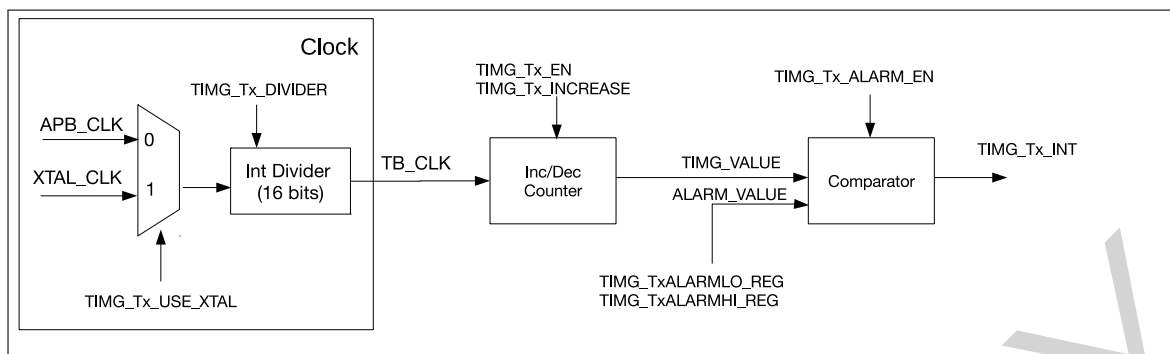

Figure 10-2. Timer Group Architecture

Figure 10-2 is a diagram of timer Tx in a timer group. Tx contains a clock selector, a 16-bit integer divider as a prescaler, a timer-based counter and a comparator for alarm generation.

10.2.1 16-bit Prescaler and Clock Selection

Each timer can select between the APB clock (APB_CLK) or external clock (XTAL_CLK) as its clock source by setting the `TIMG_Tx_USE_XTAL` field of the `TIMG_TxCONFIG_REG` register. The clock is then divided by a 16-bit prescaler to generate the time-base counter clock (TB_CLK) used by the time-base counter. When the `TIMG_Tx_DIVIDER` field is configured as 2 ~ 65536, the divisor of the prescaler would be 2 ~ 65536. Note that programming value 0 to `TIMG_Tx_DIVIDER` will result in the divisor being 65536. When the prescaler is set to 1, the actual divisor is 2, so the timer counter value represents the half of real time.

Before you modify the 16-bit prescaler, the timer must be disabled (i.e. `TIMG_Tx_EN` should be cleared). Otherwise, the result can be unpredictable.

10.2.2 54-bit Time-base Counter

The 54-bit time-base counters are based on TB_CLK and can be configured to increment or decrement via the `TIMG_Tx_INCREASE` field. The time-base counter can be enabled or disabled by setting or clearing the `TIMG_Tx_EN` field, respectively. When enabled, the time-base counter increments or decrements on each cycle of TB_CLK. When disabled, the time-base counter is essentially frozen. Note that the `TIMG_Tx_INCREASE` field can be changed while `TIMG_Tx_EN` is set and this will cause the time-base counter to change direction instantly.

To read the 54-bit value of the time-base counter, the timer value must be latched to two registers before being read by the CPU (due to the CPU being 32-bit). By writing any value to the `TIMG_TxUPDATE_REG`, the current value of the 54-bit timer is instantly latched into the `TIMG_TxLO_REG` and `TIMG_TxHI_REG` registers containing the lower 32-bits and higher 22-bits, respectively. `TIMG_TxLO_REG` and `TIMG_TxHI_REG` registers will remain unchanged for the CPU to read in its own time until `TIMG_TxUPDATE_REG` is written to again.

10.2.3 Alarm Generation

A timer can be configured to trigger an alarm when the timer's current value matches the alarm value. An alarm will cause an interrupt to occur and (optionally) an automatic reload of the timer's current value (see Section 10.2.4). The 54-bit alarm value is configured using `TIMG_TxALARMLO_REG` and `TIMG_TxALARMHI_REG`, which represent the lower 32-bits and higher 22-bits of the alarm value, respectively. However, the configured

alarm value is ineffective until the alarm is enabled by setting the `TIMG_Tx_ALARM_EN` field. To avoid alarm being enabled 'too late' (i.e. the timer value has already passed the alarm value when the alarm is enabled), the hardware will trigger the alarm immediately if the current timer value is higher than the alarm value (within a defined range) when the up-down counter increments, or lower than the alarm value (within a defined range) of when the up-down counter decrements. Table 10-1 and Table 10-2 show the relationship between the current value of the timer, the alarm value, and when an alarm is triggered. The current time value and the alarm value are defined as follows:

- `TIMG_VALUE = {TIMG_TxHI_REG, TIMG_TxLO_REG}`
- `ALARM_VALUE = {TIMG_TxALARMHI_REG, TIMG_TxALARMLO_REG}`

Table 10-1. Alarm Generation When Up-Down Counter Increments

Scenario	Range	Alarm
1	$ALARM_VALUE - TIMG_VALUE > 2^{53}$	Triggered
2	$0 < ALARM_VALUE - TIMG_VALUE \leq 2^{53}$	Triggered when the up-down counter counts <code>TIMG_VALUE</code> up to <code>ALARM_VALUE</code>
3	$0 \leq TIMG_VALUE - ALARM_VALUE < 2^{53}$	Triggered
4	$TIMG_VALUE - ALARM_VALUE \geq 2^{53}$	Triggered when the up-down counter restarts counting up from 0 after reaching the timer's maximum value and counts <code>TIMG_VALUE</code> up to <code>ALARM_VALUE</code>

Table 10-2. Alarm Generation When Up-Down Counter Decrements

Scenario	Range	Alarm
5	$TIMG_VALUE - ALARM_VALUE > 2^{53}$	Triggered
6	$0 < TIMG_VALUE - ALARM_VALUE \leq 2^{53}$	Triggered when the up-down counter counts <code>TIMG_VALUE</code> down to <code>ALARM_VALUE</code>
7	$0 \leq ALARM_VALUE - TIMG_VALUE < 2^{53}$	Triggered
8	$ALARM_VALUE - TIMG_VALUE \geq 2^{53}$	Triggered when the up-down counter restarts counting down from the timer's maximum value after reaching the minimum value and counts <code>TIMG_VALUE</code> down to <code>ALARM_VALUE</code>

When an alarm occurs, the `TIMG_Tx_ALARM_EN` field is automatically cleared and no alarm will occur again until the `TIMG_Tx_ALARM_EN` is set next time.

10.2.4 Timer Reload

A timer is reloaded when a timer's current value is overwritten with a reload value stored in the `TIMG_Tx_LOAD_LO` and `TIMG_Tx_LOAD_HI` fields that correspond to the lower 32-bits and higher 22-bits of the timer's new value, respectively. However, writing a reload value to `TIMG_Tx_LOAD_LO` and `TIMG_Tx_LOAD_HI` will not cause the timer's current value to change. Instead, the reload value is ignored by the timer until a reload event occurs. A reload event can be triggered either by a software instant reload or an auto-reload at alarm.

A software instant reload is triggered by the CPU writing any value to `TIMG_TxLOAD_REG`, which causes the timer's current value to be instantly reloaded. If `TIMG_Tx_EN` is set, the timer will continue incrementing or decrementing from the new value. If `TIMG_Tx_EN` is cleared, the timer will remain frozen at the new value until counting is re-enabled.

An auto-reload at alarm will cause a timer reload when an alarm occurs, thus allowing the timer to continue incrementing or decrementing from the reload value. This is generally useful for resetting the timer's value when using periodic alarms. To enable auto-reload at alarm, the `TIMG_Tx_AUTORELOAD` field should be set. If not enabled, the timer's value will continue to increment or decrement past the alarm value after an alarm.

10.2.5 SLOW_CLK Frequency Calculation

Via `XTAL_CLK`, a timer could calculate the frequency of clock sources for `SLOW_CLK` (i.e. `RTC_CLK`, `FOSC_DIV_CLK`, and `XTAL32K_CLK`) as follows:

1. Start periodic or one-shot frequency calculation;
2. Once receiving the signal to start calculation, the counter of `XTAL_CLK` and the counter of `SLOW_CLK` begin to work at the same time. When the counter of `SLOW_CLK` counts to `C0`, the two counters stop counting simultaneously;
3. Assume the value of `XTAL_CLK`'s counter is `C1`, and the frequency of `SLOW_CLK` would be calculated as:

$$f_{rtc} = \frac{C0 \times f_{XTAL_CLK}}{C1}$$

10.2.6 Interrupts

Each timer has its own interrupt line that can be routed to the CPU, and thus each timer group has a total of three interrupt lines. Timers generate level interrupts that must be explicitly cleared by the CPU on each triggering.

Interrupts are triggered after an alarm (or stage timeout for watchdog timers) occurs. Level interrupts will be held high after an alarm (or stage timeout) occurs, and will remain so until manually cleared. To enable a timer's interrupt, the `TIMG_Tx_INT_ENA` bit should be set.

The interrupts of each timer group are governed by a set of registers. Each timer within the group has a corresponding bit in each of these registers:

- `TIMG_Tx_INT_RAW` : An alarm event sets it to 1. The bit will remain set until the timer's corresponding bit in `TIMG_Tx_INT_CLR` is written.
- `TIMG_WDT_INT_RAW` : A stage time out will set the timer's bit to 1. The bit will remain set until the timer's corresponding bit in `TIMG_WDT_INT_CLR` is written.
- `TIMG_Tx_INT_ST` : Reflects the status of each timer's interrupt and is generated by masking the bits of `TIMG_Tx_INT_RAW` with `TIMG_Tx_INT_ENA`.
- `TIMG_WDT_INT_ST` : Reflects the status of each watchdog timer's interrupt and is generated by masking the bits of `TIMG_WDT_INT_RAW` with `TIMG_WDT_INT_ENA`.
- `TIMG_Tx_INT_ENA` : Used to enable or mask the interrupt status bits of timers within the group.
- `TIMG_WDT_INT_ENA` : Used to enable or mask the interrupt status bits of watchdog timer within the group.

- **TIMG_Tx_INT_CLR** : Used to clear a timer's interrupt by setting its corresponding bit to 1. The timer's corresponding bit in **TIMG_Tx_INT_RAW** and **TIMG_Tx_INT_ST** will be cleared as a result. Note that a timer's interrupt must be cleared before the next interrupt occurs.
- **TIMG_WDT_INT_CLR** : Used to clear a timer's interrupt by setting its corresponding bit to 1. The watchdog timer's corresponding bit in **TIMG_WDT_INT_RAW** and **TIMG_WDT_INT_ST** will be cleared as a result. Note that a watchdog timer's interrupt must be cleared before the next interrupt occurs.

10.3 Configuration and Usage

10.3.1 Timer as a Simple Clock

1. Configure the time-base counter
 - Select clock source by setting or clearing **TIMG_Tx_USE_XTAL** field.
 - Configure the 16-bit prescaler by setting **TIMG_Tx_DIVIDER**.
 - Configure the timer direction by setting or clearing **TIMG_Tx_INCREASE**.
 - Set the timer's starting value by writing the starting value to **TIMG_Tx_LOAD_LO** and **TIMG_Tx_LOAD_HI**, then reloading it into the timer by writing any value to **TIMG_TxLOAD_REG**.
2. Start the timer by setting **TIMG_Tx_EN**.
3. Get the timer's current value.
 - Write any value to **TIMG_TxUPDATE_REG** to latch the timer's current value.
 - Read the latched timer value from **TIMG_TxLO_REG** and **TIMG_TxHI_REG**.

10.3.2 Timer as One-shot Alarm

1. Configure the time-base counter following step 1 of Section 10.3.1.
2. Configure the alarm.
 - Configure the alarm value by setting **TIMG_TxALARMLO_REG** and **TIMG_TxALARMHI_REG**.
 - Enable interrupt by setting **TIMG_Tx_INT_ENA**.
3. Disable auto reload by clearing **TIMG_Tx_AUTORELOAD**.
4. Start the alarm by setting **TIMG_Tx_ALARM_EN**.
5. Handle the alarm interrupt.
 - Clear the interrupt by setting the timer's corresponding bit in **TIMG_Tx_INT_CLR**.
 - Disable the timer by clearing **TIMG_Tx_EN**.

10.3.3 Timer as Periodic Alarm

1. Configure the time-base counter following step 1 in Section 10.3.1.
2. Configure the alarm following step 2 in Section 10.3.2.
3. Enable auto reload by setting **TIMG_Tx_AUTORELOAD** and configure the reload value via **TIMG_Tx_LOAD_LO** and **TIMG_Tx_LOAD_HI**.

4. Start the alarm by setting [TIMG_Tx_ALARM_EN](#).
5. Handle the alarm interrupt (repeat on each alarm iteration).
 - Clear the interrupt by setting the timer's corresponding bit in [TIMG_Tx_INT_CLR](#).
 - If the next alarm requires a new alarm value and reload value (i.e. different alarm interval per iteration), then [TIMG_TxALARMLO_REG](#), [TIMG_TxALARMHI_REG](#), [TIMG_Tx_LOAD_LO](#), and [TIMG_Tx_LOAD_HI](#) should be reconfigured as needed. Otherwise, the aforementioned registers should remain unchanged.
 - Re-enable the alarm by setting [TIMG_Tx_ALARM_EN](#).
6. Stop the timer (on final alarm iteration).
 - Clear the interrupt by setting the timer's corresponding bit in [TIMG_Tx_INT_CLR](#).
 - Disable the timer by clearing [TIMG_Tx_EN](#).

10.3.4 SLOW_CLK Frequency Calculation

1. One-shot frequency calculation
 - Select the clock whose frequency is to be calculated (clock source of SLOW_CLK) via [TIMG_RTC_CALI_CLK_SEL](#), and configure the time of calculation via [TIMG_RTC_CALI_MAX](#).
 - Select one-shot frequency calculation by clearing [TIMG_RTC_CALI_START_CYCLING](#), and enable the two counters via [TIMG_RTC_CALI_START](#).
 - Once [TIMG_RTC_CALI_RDY](#) becomes 1, read [TIMG_RTC_CALI_VALUE](#) to get the value of XTAL_CLK's counter, and calculate the frequency of SLOW_CLK.
2. Periodic frequency calculation
 - Select the clock whose frequency is to be calculated (clock source of SLOW_CLK) via [TIMG_RTC_CALI_CLK_SEL](#), and configure the time of calculation via [TIMG_RTC_CALI_MAX](#).
 - Select periodic frequency calculation by enabling [TIMG_RTC_CALI_START_CYCLING](#).
 - When [TIMG_RTC_CALI_CYCLING_DATA_VLD](#) is 1, [TIMG_RTC_CALI_VALUE](#) is valid.
3. Timeout

If the counter of SLOW_CLK cannot finish counting in [TIMG_RTC_CALI_TIMEOUT_RST_CNT](#) cycles, [TIMG_RTC_CALI_TIMEOUT](#) will be set to indicate a timeout.

10.4 Register Summary

The addresses in this section are relative to **Timer Group** base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
Timer 0 configuration and control registers			
TIMG_T0CONFIG_REG	Timer 0 configuration register	0x0000	varies
TIMG_T0LO_REG	Timer 0 current value, low 32 bits	0x0004	RO
TIMG_T0HI_REG	Timer 0 current value, high 22 bits	0x0008	RO
TIMG_T0UPDATE_REG	Write to copy current timer value to TIMG_T0LO_REG or TIMG_T0HI_REG	0x000C	R/W/SC
TIMG_T0ALARMLO_REG	Timer 0 alarm value, low 32 bits	0x0010	R/W
TIMG_T0ALARMHI_REG	Timer 0 alarm value, high bits	0x0014	R/W
TIMG_T0LOADLO_REG	Timer 0 reload value, low 32 bits	0x0018	R/W
TIMG_T0LOADHI_REG	Timer 0 reload value, high 22 bits	0x001C	R/W
TIMG_T0LOAD_REG	Write to reload timer from TIMG_T0LOADLO_REG or TIMG_T0LOADHI_REG	0x0020	WT
Timer 1 configuration and control registers			
TIMG_T1CONFIG_REG	Timer 1 configuration register	0x0024	varies
TIMG_T1LO_REG	Timer 1 current value, low 32 bits	0x0028	RO
TIMG_T1HI_REG	Timer 1 current value, high 22 bits	0x002C	RO
TIMG_T1UPDATE_REG	Write to copy current timer value to TIMG_T1LO_REG or TIMG_T1HI_REG	0x0030	R/W/SC
TIMG_T1ALARMLO_REG	Timer 1 alarm value, low 32 bits	0x0034	R/W
TIMG_T1ALARMHI_REG	Timer 1 alarm value, high bits	0x0038	R/W
TIMG_T1LOADLO_REG	Timer 1 reload value, low 32 bits	0x003C	R/W
TIMG_T1LOADHI_REG	Timer 1 reload value, high 22 bits	0x0040	R/W
TIMG_T1LOAD_REG	Write to reload timer from TIMG_T1LOADLO_REG or TIMG_T1LOADHI_REG	0x0044	WT
Configuration and control registers for WDT			
TIMG_WDTCONFIG0_REG	Watchdog timer configuration register	0x0048	R/W
TIMG_WDTCONFIG1_REG	Watchdog timer prescaler register	0x004C	R/W
TIMG_WDTCONFIG2_REG	Watchdog timer stage 0 timeout value	0x0050	R/W
TIMG_WDTCONFIG3_REG	Watchdog timer stage 1 timeout value	0x0054	R/W
TIMG_WDTCONFIG4_REG	Watchdog timer stage 2 timeout value	0x0058	R/W
TIMG_WDTCONFIG5_REG	Watchdog timer stage 3 timeout value	0x005C	R/W
TIMG_WDTFEED_REG	Write to feed the watchdog timer	0x0060	WT
TIMG_WDTWPROTECT_REG	Watchdog write protect register	0x0064	R/W
Configuration and control registers for RTC frequency calculation			
TIMG_RTCCALICFG_REG	RTC frequency calculation configuration register 0	0x0068	varies

Name	Description	Address	Access
TIMG_RTCCALICFG1_REG	RTC frequency calculation configuration register 1	0x006C	RO
TIMG_RTCCALICFG2_REG	RTC frequency calculation calibration register 2	0x0080	varies
Interrupt registers			
TIMG_INT_ENA_TIMERS_REG	Interrupt enable bits	0x0070	R/W
TIMG_INT_RAW_TIMERS_REG	Raw interrupt status	0x0074	R/WTC/SS
TIMG_INT_ST_TIMERS_REG	Masked interrupt status	0x0078	RO
TIMG_INT_CLR_TIMERS_REG	Interrupt clear bits	0x007C	WT
Version register			
TIMG_NTIMERS_DATE_REG	Timer version control register	0x00F8	R/W
Timer group configuration registers			
TIMG_REGCLK_REG	Timer group clock gate register	0x00FC	R/W

Register 10.3. TIMG_T_xHI_REG (x: 0-1) (0x0008+0x24*x)

TIMG_T_xHI After writing to TIMG_T_xUPDATE_REG, the high 22 bits of the time-base counter of timer *x* can be read here. (RO)

Register 10.4. TIMG_T_xUPDATE_REG (x: 0-1) (0x000C+0x24*x)

TIMG_T_xUPDATE After writing 0 or 1 to TIMG_T_xUPDATE_REG, the counter value is latched. (R/W/SC)

Register 10.5. TIMG_T_xALARMLO_REG (x: 0-1) (0x0010+0x24*x)

TIMG_T_xALARMLO Timer *x* alarm trigger time-base counter value, low 32 bits. (R/W)

Register 10.6. TIMG_T_xALARMHI_REG (x: 0-1) (0x0014+0x24*x)

TIMG_T_xALARMHI Timer *x* alarm trigger time-base counter value, high 22 bits. (R/W)

Register 10.7. TIMG_T_xLOADLO_REG (x: 0-1) (0x0018+0x24*x)

TIMG_T_xLOAD_LO Low 32 bits of the value that a reload will load onto timer *x* time-base counter.
(R/W)

Register 10.8. TIMG_T_xLOADHI_REG (x: 0-1) (0x001C+0x24*x)

TIMG_T_xLOAD_HI High 22 bits of the value that a reload will load onto timer *x* time-base counter.
(R/W)

Register 10.9. TIMG_T_xLOAD_REG (x: 0-1) (0x0020+0x24*x)

TIMG_T_xLOAD Write any value to trigger a timer *x* time-base counter reload. (WT)

Register 10.12. TIMG_WDTCONFIG2_REG (0x0050)

TIMG_WDT_STG0_HOLD Stage 0 timeout value, in MWDT clock cycles. (R/W)

Register 10.13. TIMG_WDTCONFIG3_REG (0x0054)

TIMG_WDT_STG1_HOLD Stage 1 timeout value, in MWDT clock cycles. (R/W)

Register 10.14. TIMG_WDTCONFIG4_REG (0x0058)

TIMG_WDT_STG2_HOLD Stage 2 timeout value, in MWDT clock cycles. (R/W)

Register 10.15. TIMG_WDTCONFIG5_REG (0x005C)

TIMG_WDT_STG3_HOLD Stage 3 timeout value, in MWDT clock cycles. (R/W)

Register 10.16. TIMG_WDTFEED_REG (0x0060)

TIMG_WDT_FEED Write any value to feed the MWDT. (WT)

Register 10.17. TIMG_WDTWPROTECT_REG (0x0064)

TIMG_WDT_WKEY If the register contains a different value than its reset value, write protection is enabled. (R/W)

Register 10.18. TIMG_RTCCALICFG_REG (0x0068)

TIMG_RTC_CALI_START		TIMG_RTC_CALI_MAX				TIMG_RTC_CALI_RDY				TIMG_RTC_CALI_CLK_SEL				TIMG_RTC_CALI_START_CYCLING				(reserved)			
31	30	16				15	14	13	12	11	0				0						
0		0x01				0				0x1				1				0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0			

Reset

TIMG_RTC_CALI_START_CYCLING Enables periodic frequency calculation. (R/W)

TIMG_RTC_CALI_CLK_SEL Used to select the clock to be calibrated. 0: RTC_CLK; 1: FOSC_DIV_CLK; 2: XTAL32K_CLK. (R/W)

TIMG_RTC_CALI_RDY Marks the completion of one-shot frequency calculation. (RO)

TIMG_RTC_CALI_MAX Configures the time to calculate the frequency of RTC slow clock SLOW_CLK. Measurement unit: SLOW_CLK cycle. (R/W)

TIMG_RTC_CALI_START Enables one-shot frequency calculation. (R/W)

Register 10.19. TIMG_RTCCALICFG1_REG (0x006C)

TIMG_RTC_CALI_VALUE							(reserved)				TIMG_RTC_CALI_CYCLING_DATA_VLD											
31							7				6				1				0			
0x00000							0				0				0				0			

Reset

TIMG_RTC_CALI_CYCLING_DATA_VLD Marks the completion of periodic frequency calculation. (RO)

TIMG_RTC_CALI_VALUE When one-shot or periodic frequency calculation completes, read this value to calculate the frequency of RTC slow clock SLOW_CLK. Measurement unit: XTAL_CLK cycle. (RO)

Register 10.23. TIMG_INT_ST_TIMERS_REG (0x0078)

TIMG_T_x_INT_ST The masked interrupt status bit for the TIMG_T_x_INT interrupt. (RO)

TIMG_WDT_INT_ST The masked interrupt status bit for the TIMG_WDT_INT interrupt. (RO)

Register 10.24. TIMG_INT_CLR_TIMERS_REG (0x007C)

TIMG_T_x_INT_CLR Set this bit to clear the TIMG_T_x_INT interrupt. (WT)

TIMG_WDT_INT_CLR Set this bit to clear the TIMG_WDT_INT interrupt. (WT)

Register 10.25. TIMG_NTIMERS_DATE_REG (0x00F8)

TIMG_NTIMERS_DATE Timer version control register. (R/W)

Register 10.26. TIMG_REGCLK_REG (0x00FC)

TIMG_CLK_EN		(reserved)																												0
31	30																													0
																														Reset

TIMG_CLK_EN Register clock gate signal. 0: The clock used by software to read and write registers is on only when there is software operation. 1: The clock used by software to read and write registers is always on. (R/W)

11 Watchdog Timers (WDT)

11.1 Overview

Watchdog timers are hardware timers used to detect and recover from malfunctions. They must be periodically fed (reset) to prevent a timeout. A system/software that is behaving unexpectedly (e.g. is stuck in a software loop or in overdue events) will fail to feed the watchdog thus trigger a watchdog timeout. Therefore, watchdog timers are useful for detecting and handling erroneous system/software behavior.

As shown in Figure 11-1, ESP32-S3 contains three digital watchdog timers: one in each of the two timer groups in Chapter 10 *Timer Group (TIMG)* (called Main System Watchdog Timers, or MWDT) and one in the RTC Module (called the RTC Watchdog Timer, or RWDT). Each digital watchdog timer allows for four separately configurable stages and each stage can be programmed to take one action upon expiry, unless the watchdog is fed or disabled. MWDT supports three timeout actions: interrupt, CPU reset, and core reset, while RWDT supports four timeout actions: interrupt, CPU reset, core reset, and system reset (see details in Section 11.2.2.2 *Stages and Timeout Actions*). A timeout value can be set for each stage individually.

During the flash boot process, RWDT and the first MWDT in timergroup 0 are enabled automatically in order to detect and recover from booting errors.

ESP32-S3 also has one analog watchdog timer: Super watchdog (SWD). It is an ultra-low-power circuit in analog domain that helps to prevent the system from operating in a sub-optimal state and resets the system if required.

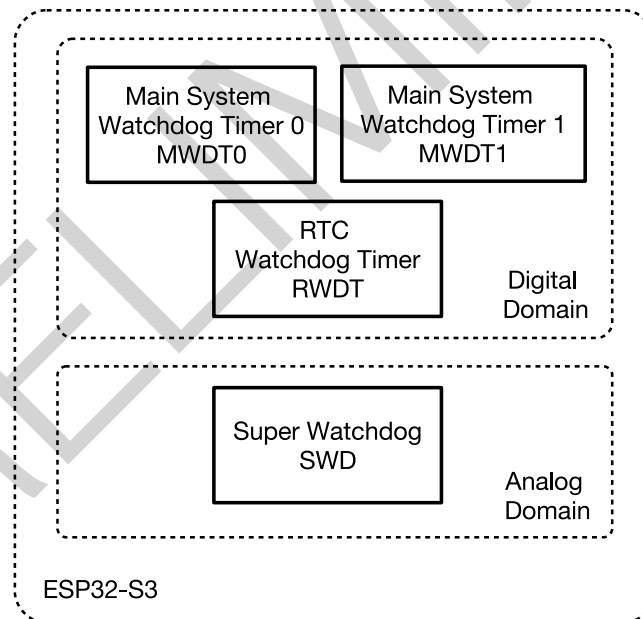

Figure 11-1. Watchdog Timers Overview

Note that while this chapter provides the functional descriptions of the watchdog timer's, their register descriptions are provided in Chapter 10 *Timer Group (TIMG)* and Chapter 5 *Low-Power Management (RTC_CNTL)* [to be added later].

11.2 Digital Watchdog Timers

11.2.1 Features

Watchdog timers have the following features:

- Four stages, each with a programmable timeout value. Each stage can be configured and enabled/disabled separately
- Three timeout actions (interrupt, CPU reset, or core reset) for MWDT and four timeout actions (interrupt, CPU reset, core reset, or system reset) for RWDT upon expiry of each stage
- 32-bit expiry counter
- Write protection, to prevent RWDT and MWDT configuration from being altered inadvertently
- Flash boot protection
If the boot process from an SPI flash does not complete within a predetermined period of time, the watchdog will reboot the entire main system.

11.2.2 Functional Description

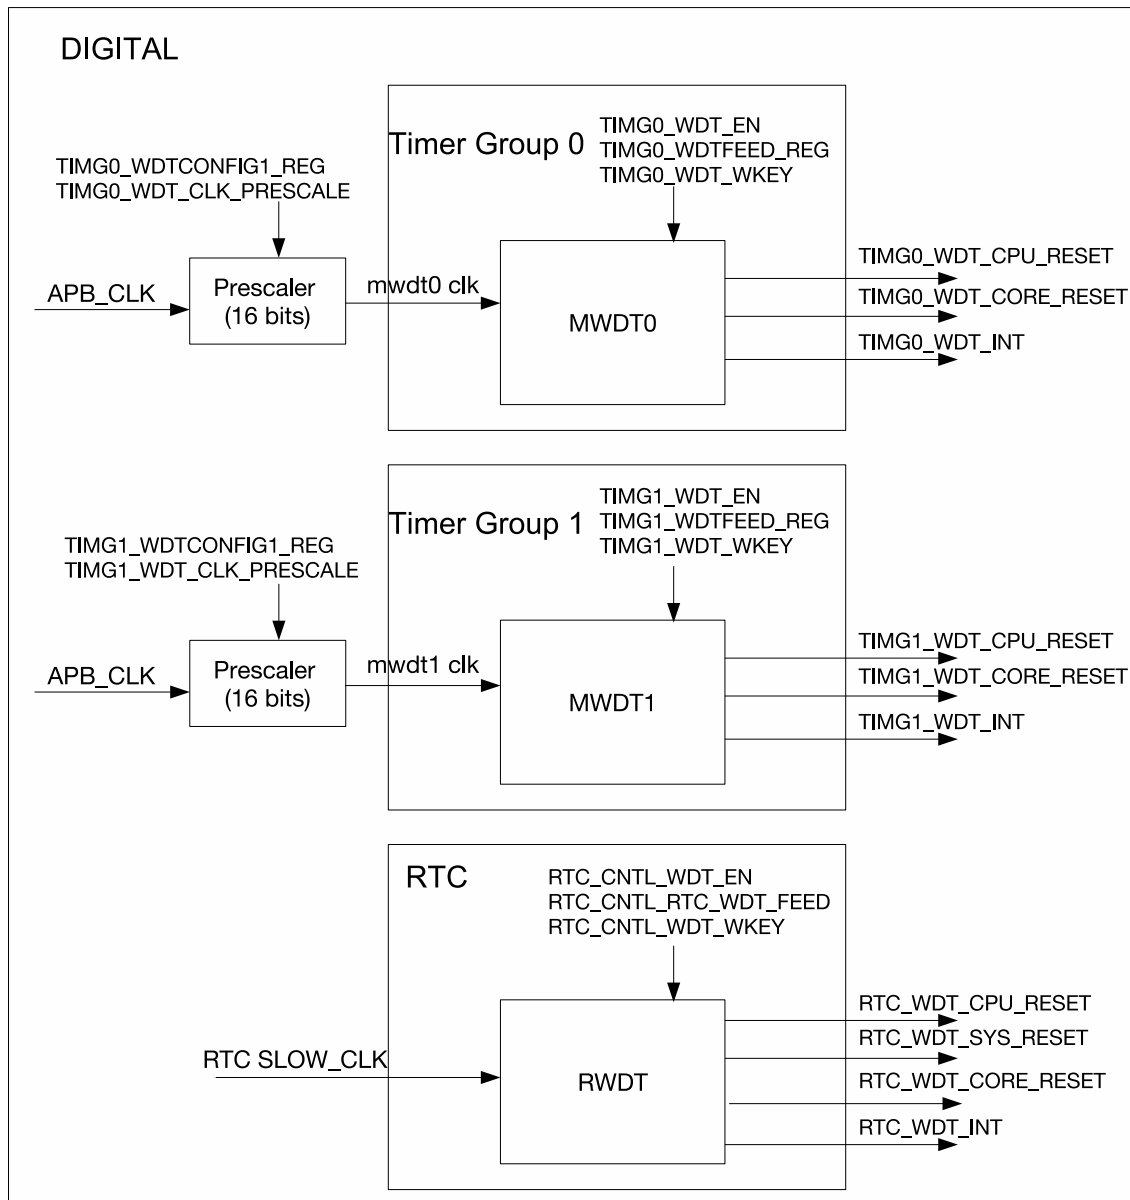

Figure 11-2. Watchdog Timers in ESP32-S3

Figure 11-2 shows the three watchdog timers in ESP32-S3 digital systems.

11.2.2.1 Clock Source and 32-Bit Counter

At the core of each watchdog timer is a 32-bit counter. The clock source of MWDTs is derived from the APB clock via a pre-MWDT 16-bit configurable prescaler. In contrast, the clock source of RWDT is derived directly from an RTC slow clock (the RTC slow clock source shown in Chapter 6 *Reset and Clock*). The 16-bit prescaler for MWDTs is configured via the `TIMG_WDT_CLK_PRESCALE` field of `TIMG_WDTCONFIG1_REG`.

MWDTs and RWDT are enabled by setting the `TIMG_WDT_EN` and `RTC_CNTL_WDT_EN` fields respectively. When enabled, the 32-bit counters of each watchdog will increment on each source clock cycle until the timeout value of the current stage is reached (i.e. expiry of the current stage). When this occurs, the current counter value is reset to zero and the next stage will become active. If a watchdog timer is fed by software, the timer will return

to stage 0 and reset its counter value to zero. Software can feed a watchdog timer by writing any value to [TIMG_WDTFEED_REG](#) for MDWTs and [RTC_CNTL_RTC_WDT_FEED](#) for RWDT.

11.2.2.2 Stages and Timeout Actions

Timer stages allow for a timer to have a series of different timeout values and corresponding expiry action. When one stage expires, the expiry action is triggered, the counter value is reset to zero, and the next stage becomes active. MWDTs/ RWDT provide four stages (called stages 0 to 3). The watchdog timers will progress through each stage in a loop (i.e. from stage 0 to 3, then back to stage 0).

Timeout values of each stage for MWDTs are configured in [TIMG_WDTCONFIG_i_REG](#) (where *i* ranges from 2 to 5), whilst timeout values for RWDT are configured using [RTC_CNTL_WDT_STG_j_HOLD](#) field (where *j* ranges from 0 to 3).

Please note that the timeout value of stage 0 for RWDT (T_{hold0}) is determined by the combination of the [EFUSE_WDT_DELAY_SEL](#) field of eFuse register [EFUSE_RD_REPEAT_DATA1_REG](#) and [RTC_CNTL_WDT_STG0_HOLD](#). The relationship is as follows:

$$T_{hold0} = \text{RTC_CNTL_WDT_STG0_HOLD} \ll (\text{EFUSE_WDT_DELAY_SEL} + 1)$$

where \ll is a left-shift operator.

Upon the expiry of each stage, one of the following expiry actions will be executed:

- Trigger an interrupt
When the stage expires, an interrupt is triggered.
- CPU reset – Reset a CPU core
When the stage expires, the CPU core will be reset.
- Core reset – Reset the main system
When the stage expires, the main system (which includes MWDTs, CPU, and all peripherals) will be reset. The power management unit and RTC peripheral will not be reset.
- System reset – Reset the main system, power management unit and RTC peripheral
When the stage expires the main system, power management unit and RTC peripheral (see details in [Chapter 5 Low-Power Management \(RTC_CNTL\) \[to be added later\]](#)) will all be reset. This action is only available in RWDT.
- Disabled
This stage will have no effects on the system.

Timeout values of each stage for MWDTs are configured in [TIMG_WDTCONFIG_i_REG](#) (where *i* ranges from 2 to 5), whilst timeout values for RWDT are configured using [RTC_CNTL_WDT_STG_j_HOLD](#) field (where *j* ranges from 0 to 3).

11.2.2.3 Write Protection

Watchdog timers are critical to detecting and handling erroneous system/software behavior, thus should not be disabled easily (e.g. due to a misplaced register write). Therefore, MWDTs and RWDT incorporate a write protection mechanism that prevent the watchdogs from being disabled or tampered with due to an accidental write.

The write protection mechanism is implemented using a write-key field for each timer (`TIMG_WDT_WKEY` for MWDT, `RTC_CNTL_WDT_WKEY` for RWDT). The value `0x50D83AA1` must be written to the watchdog timer's write-key field before any other register of the same watchdog timer can be changed. Any attempts to write to a watchdog timer's registers (other than the write-key field itself) whilst the write-key field's value is not `0x50D83AA1` will be ignored. The recommended procedure for accessing a watchdog timer is as follows:

1. Disable the write protection by writing the value `0x50D83AA1` to the timer's write-key field.
2. Make the required modification of the watchdog such as feeding or changing its configuration.
3. Re-enable write protection by writing any value other than `0x50D83AA1` to the timer's write-key field.

11.2.2.4 Flash Boot Protection

During flash booting process, MWDT in timer group 0 (see Figure 10-1 *Timer Units within Groups*), as well as RWDT, are automatically enabled. Stage 0 for the enabled MWDT is automatically configured to reset the system upon expiry, known as core reset. Likewise, stage 0 for RWDT is configured to system reset, which resets the main system and RTC when it expires. After booting, `TIMG_WDT_FLASHBOOT_MOD_EN` and `RTC_CNTL_WDT_FLASHBOOT_MOD_EN` should be cleared to stop the flash boot protection procedure for both MWDT and RWDT respectively. After this, MWDT and RWDT can be configured by software.

11.3 Super Watchdog

Super watchdog (SWD) is an ultra-low-power circuit in analog domain that helps to prevent the system from operating in a sub-optimal state and resets the system if required. SWD contains a watchdog circuit that needs to be fed for at least once during its timeout period, which is slightly less than one second. About 100 ms before watchdog timeout, it will also send out a `WD_INTR` signal as a request to remind the system to feed the watchdog.

If the system doesn't respond to SWD feed request and watchdog finally times out, SWD will generate a system level signal `SWD_RSTB` to reset whole digital circuits on the chip.

11.3.1 Features

SWD has the following features:

- Ultra-low power
- Interrupt to indicate that the SWD timeout period is close to expiring
- Various dedicated methods for software to feed SWD, which enables SWD to monitor the working state of the whole operating system

11.3.2 Super Watchdog Controller

11.3.2.1 Structure

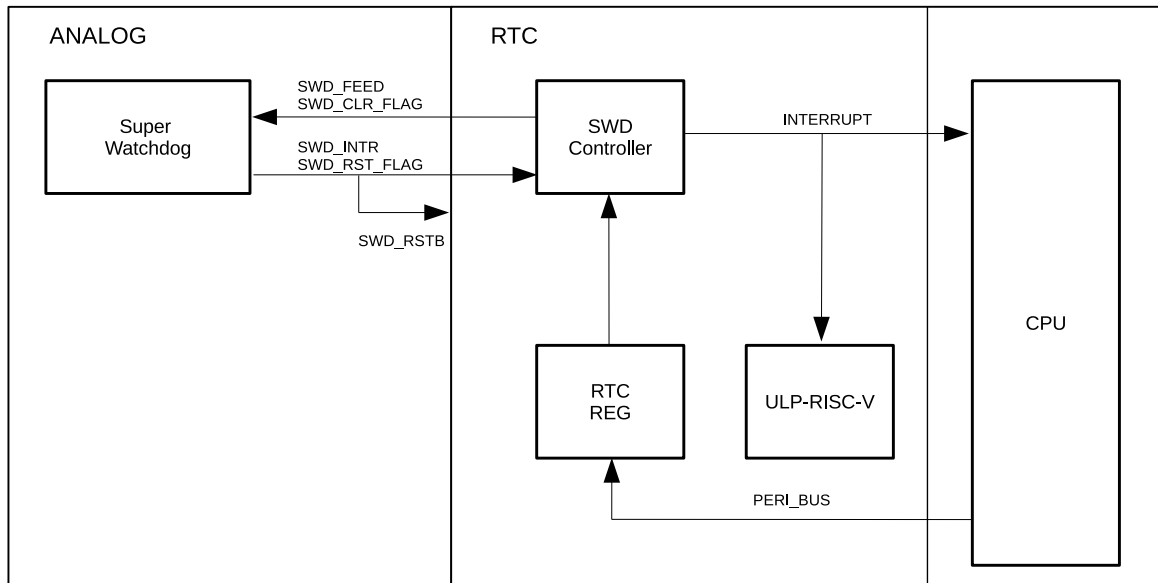

Figure 11-3. Super Watchdog Controller Structure

11.3.2.2 Workflow

In normal state:

- SWD controller receives feed request from SWD.
- SWD controller can send an interrupt to main CPU or ULP-RISC-V.
- Main CPU can decide whether to feed SWD directly by setting `RTC_CNTL_SWD_FEED`, or send an interrupt to ULP-RISC-V and ask ULP-RISC-V to feed SWD by setting `RTC_CNTL_SWD_FEED`.
- When trying to feed SWD, CPU or ULP-RISC-V needs to disable SWD controller's write protection by writing `0x8F1D312A` to `RTC_CNTL_SWD_WKEY`. This prevents SWD from being fed by mistake when the system is operating in sub-optimal state.
- If setting `RTC_CNTL_SWD_AUTO_FEED_EN` to 1, SWD controller can also feed SWD itself without any interaction with CPU or ULP-RISC-V.

After reset:

- Check `RTC_CNTL_RESET_CAUSE_PROCPU[5:0]` for the cause of CPU reset.
If `RTC_CNTL_RESET_CAUSE_PROCPU[5:0] == 0x12`, it indicates that the cause is SWD reset.
- Set `RTC_CNTL_SWD_RST_FLAG_CLR` to clear the SWD reset flag.

11.4 Interrupts

For watchdog timer interrupts, please refer to Section 10.2.6 *Interrupts* in Chapter 10 *Timer Group (TIMG)*.

11.5 Registers

MWDT registers are part of the timer submodule and are described in Section [10.4 Register Summary](#) in Chapter [10 Timer Group \(TIMG\)](#). RWDT and SWD registers are part of the RTC submodule and are described in Section [6 Register Summary](#) in Chapter [5 Low-Power Management \(RTC_CNTL\)](#) *[to be added later]*.

PRELIMINARY

12 XTAL32K Watchdog Timers (XTWDT)

12.1 Overview

The XTAL32K watchdog timer on ESP32-S3 is used to monitor the status of external crystal XTAL32K_CLK. This watchdog timer can detect the oscillation failure of XTAL32K_CLK, change the clock source of RTC, etc. When XTAL32K_CLK works as the clock source of RTC SLOW_CLK (for clock description, see Chapter 6 *Reset and Clock*) and stops oscillating, the XTAL32K watchdog timer first switches to BACKUP32K_CLK derived from RTC_CLK and generates an interrupt (if the chip is in Light-sleep or Deep-sleep mode, the CPU will be woken up), and then switches back to XTAL32K_CLK after it is restarted by software.

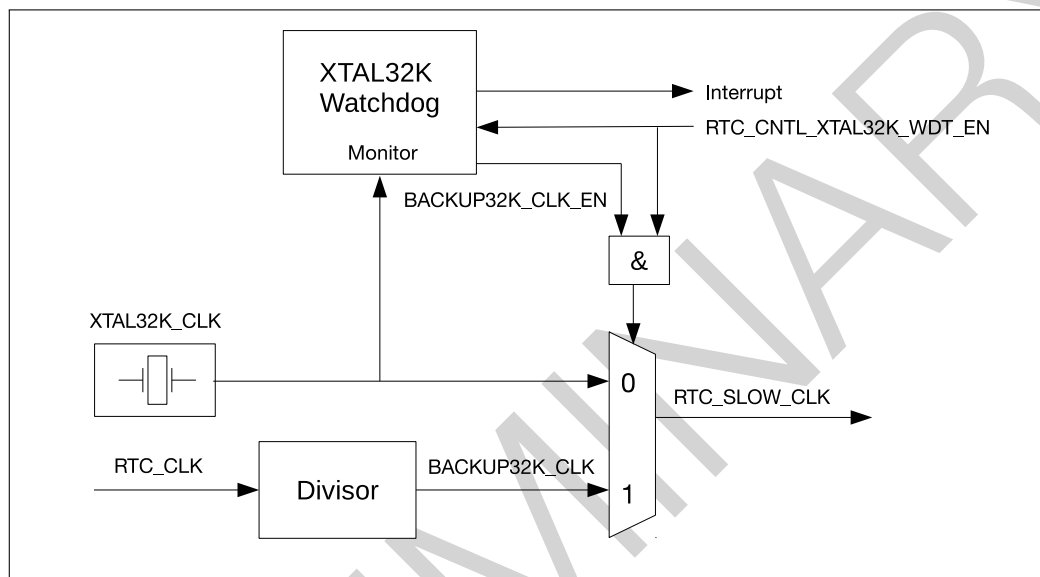

Figure 12-1. XTAL32K Watchdog Timer

12.2 Features

12.2.1 Interrupt and Wake-Up

When the XTAL32K watchdog timer detects the oscillation failure of XTAL32K_CLK, an oscillation failure interrupt `RTC_XTAL32K_DEAD_INT` (for interrupt description, please refer to Chapter 5 *Low-Power Management (RTC_CNTL) [to be added later]*) is generated. At this point, the CPU will be woken up if in Light-sleep mode or Deep-sleep mode.

12.2.2 BACKUP32K_CLK

Once the XTAL32K watchdog timer detects the oscillation failure of XTAL32K_CLK, it replaces XTAL32K_CLK with BACKUP32K_CLK (with a frequency of 32 kHz or so) derived from RTC_CLK as RTC's SLOW_CLK, so as to ensure proper functioning of the system.

12.3 Functional Description

12.3.1 Workflow

1. The XTAL32K watchdog timer starts counting when `RTC_CNTL_XTAL32K_WDT_EN` is enabled. The counter based on `RTC_CLK` keeps counting until it detects the positive edge of `XTAL_32K` and is then cleared. When the counter reaches `RTC_CNTL_XTAL32K_WDT_TIMEOUT`, it generates an interrupt or a wake-up signal and is then reset.
2. If `RTC_CNTL_XTAL32K_AUTO_BACKUP` is set and step 1 is finished, the XTAL32K watchdog timer will automatically enable `BACKUP32K_CLK` as the alternative clock source of `RTC_SLOW_CLK`, to ensure the system's proper functioning and the accuracy of timers running on `RTC_SLOW_CLK` (e.g. `RTC_TIMER`). For information about clock frequency configuration, please refer to Section 12.3.2.
3. To restore the XTAL32K watchdog timer, software restarts `XTAL32K_CLK` by turning its XPD (meaning no power-down) signal off and on again via `RTC_CNTL_XPD_XTAL_32K` bit. Then, the XTAL32K watchdog timer switches back to `XTAL32K_CLK` as the clock source of `RTC_SLOW_CLK` by clearing `RTC_CNTL_XTAL32K_WDT_EN` (`BACKUP32K_CLK_EN` is also automatically cleared). If the chip is in Light-sleep or Deep-sleep mode, the XTAL32K watchdog timer will wake up the CPU to finish the above steps.

12.3.2 BACKUP32K_CLK Working Principle

Chips have different `RTC_CLK` frequencies due to production process variations. To ensure the accuracy of `RTC_TIMER` and other timers running on `SLOW_CLK` when `BACKUP32K_CLK` is at work, the divisor of `BACKUP32K_CLK` should be configured according to the actual frequency of `RTC_CLK` (see details in Chapter 5 *Low-Power Management (RTC_CNTL) [to be added later]*) via `RTC_CNTL_XTAL32K_CLK_FACTOR_REG` register. Each byte in this register corresponds to a divisor component ($x_0 \sim x_7$). `BACKUP32K_CLK` is divided by a fraction where the denominator is always 4, as calculated below.

$$f_{back_clk}/4 = f_{rtc_clk}/S$$

$$S = x_0 + x_1 + \dots + x_7$$

f_{back_clk} is the desired frequency of `BACKUP32K_CLK`; f_{rtc_clk} is the actual frequency of `RTC_CLK`; $x_0 \sim x_7$ correspond to the pulse width in high and low state of four `BACKUP32K_CLK` clock signals (unit: `RTC_CLK` clock cycle).

12.3.3 Configuring the Divisor Component of BACKUP32K_CLK

Based on principles described in Section 12.3.2, you can configure the divisor component as follows:

- Calculate the sum of divisor components S according to the frequency of `RTC_CLK` and the desired frequency of `BACKUP32K_CLK`;
- Calculate the integer part of divisor $N = f_{rtc_clk}/f_{back_clk}$;
- Calculate the integer part of divisor component $M = N/2$. The integer part of divisor N are separated into two parts because a divisor component corresponds to a pulse width in high or low state;
- Calculate the number of divisor components that equal M ($x_n = M$) and the number of divisor components that equal $M + 1$ ($x_n = M + 1$) according to the value of M and S . ($M + 1$) is the fractional part of divisor component.

For example, if the frequency of RTC_CLK is 163 kHz, then $f_{rtc_clk} = 163000$, $f_{back_clk} = 32768$, $S = 20$, $M = 2$, and $\{x_0, x_1, x_2, x_3, x_4, x_5, x_6, x_7\} = \{2, 3, 2, 3, 2, 3, 2, 3\}$. As a result, the frequency of BACKUP32K_CLK is 32.6 kHz.

PRELIMINARY

13 Permission Control (PMS)

13.1 Overview

ESP32-S3 is specially designed for flexible access management to internal memory, external memory, and all peripherals. Once configured, CPU can only access a particular slave device according to the configured permission, thus protecting the slave device from unauthorized access (read, write, or instruction execution).

In addition, ESP32-S3 has integrated a World Controller, which when enabled can be used along with Permission Controller to allocate the chip's hardware and software resource into Secure World (World0) and Non-secure World (World1), and can switch the CPU between running from the Secure World or Non-secure World. For details, please refer to [14 World Controller](#).

This chapter mainly describes the access management to different internal memory, external memory and peripherals.

13.2 Features

ESP32-S3's Permission Control module supports:

- Independent access management for the Secure World and Non-secure World.
- Independent access management to internal memory, including
 - CPU access to internal memory
 - Allocate internal memory as CPU Trace
 - GDMA access to internal memory
- Independent access management to external memory, including
 - SPI1 access to external memory
 - GDMA access to external memory
 - CACHE access to external memory
- Independent access management to peripheral regions, including
 - CPU access to peripheral regions
 - Interrupt upon unsupported access alignment
- Address splitting for more flexible access management
- Interrupt upon unauthorized access
- Register locks to secure the integrity of Permission Control related registers
- Protection to secure the integrity of CPU's VECBASE registers

13.3 Internal Memory

ESP32-S3 has the following types of internal memory:

- ROM: 384 KB in total, including 256 KB Internal ROM0 and 128 KB Internal ROM1

- SRAM: 512 KB in total, including 32 KB Internal SRAM0, 416 KB Internal SRAM1, and 64 KB Internal SRAM2
- RTC FAST Memory: 8 KB in total, which can be split into two regions with independent permission configuration
- RTC SLOW Memory: 8 KB in total, which can be further split into two regions each with independent permission configuration

This section describes how to configure the permission to each types of ESP32-S3's internal memory.

13.3.1 ROM

ESP32-S3's ROM can be accessed by CPU's instruction bus (IBUS) and data bus (DBUS) when configured.

Note:

- Permission for Secure World and Non-secure World can be configured independently.
- Once configured, the permission applies for both CPU0 and CPU1.

13.3.1.1 Address

ESP32-S3's ROM address and the address ranges accessible for IBUS and DBUS respectively are listed in Table 13-1.

Table 13-1. ROM Address

ROM	IBUS Address		DBUS Address	
	Starting Address	Ending Address	Starting Address	Ending Address
Internal ROM0	0x4000_0000	0x4003_FFFF	-	-
Internal ROM1	0x4004_0000	0x4005_FFFF	0x3FF0_0000	0x3FF1_FFFF

13.3.1.2 Access Configuration

ESP32-S3 uses the registers listed in Table 13-2 to configure the instruction execution (X), write (W) and read (R) accesses of CPU's IBUS and DBUS, from the Secure World and Non-secure World, to ROM:

Table 13-2. Access Configuration to ROM

Bus	From World	Configuration Registers ^A	Access
IBUS	Secure World	PMS_CORE_X_IRAM0_PMS_CONSTRAIN_2_REG [20:18] ^B	X/W/R
	Non-secure World	PMS_CORE_X_IRAM0_PMS_CONSTRAIN_1_REG [20:18]	X/W/R
DBUS	Secure World	PMS_CORE_X_DRAM0_PMS_CONSTRAIN_1_REG [25:24] ^C	W/R
	Non-secure World	PMS_CORE_X_DRAM0_PMS_CONSTRAIN_1_REG [27:26]	W/R

^A 1: with access; 0: without access

^B For example, configuring this field to 0b101 indicates CPU's IBUS is granted with instruction execution and read accesses but not write access to ROM from the Secure World.

^C For example, configuring this field to 0b01 indicates CPU's DBUS is granted with read access but not write access to ROM from the Secure World.

13.3.2 SRAM

ESP32-S3's SRAM can be accessed by CPU's instruction bus (IBUS) and data bus (DBUS) when configured.

Note:

- Permission for Secure World and Non-secure World can be configured independently.
- Once configured, the configuration applies for both CPU0 and CPU1.

13.3.2.1 Address

ESP32-S3's SRAM address and the address ranges accessible for IBUS and DBUS respectively are listed in Table 13-3.

Table 13-3. SRAM Address

SRAM	Block	IBUS Address		DBUS Address	
		Starting Address	Ending Address	Starting Address	Ending Address
Internal SRAM0	Block0	0x4037_0000	0x4037_3FFF	-	-
	Block1	0x4037_4000	0x4037_7FFF	-	-
Internal SRAM1	Block2	0x4037_8000	0x4037_FFFF	0x3FC8_8000	0x3FC8_FFFF
	Block3	0x4038_0000	0x4038_FFFF	0x3FC9_0000	0x3FC9_FFFF
	Block4	0x4039_0000	0x4039_FFFF	0x3FCA_0000	0x3FCA_FFFF
	Block5	0x403A_0000	0x403A_FFFF	0x3FCB_0000	0x3FCB_FFFF
	Block6	0x403B_0000	0x403B_FFFF	0x3FCC_0000	0x3FCC_FFFF
	Block7	0x403C_0000	0x403C_FFFF	0x3FCD_0000	0x3FCD_FFFF
Internal SRAM 2	Block8	0x403D_0000	0x403D_FFFF	0x3FCE_0000	0x3FCE_FFFF
	Block9	-	-	0x3FCF_0000	0x3FCF_7FFF
	Block10	-	-	0x3FCF_8000	0x3FCF_FFFF

Here, we will first introduce how to configure the permission to Internal SRAM0, Internal SRAM1, and Internal SRAM2, and also how to configure the Internal SRAM1 as CPU Trace memory.

13.3.2.2 Internal SRAM0 Access Configuration

ESP32-S3's Internal SRAM0 includes Block0 and Block1 (see details in Table 13-3) and can be allocated to either CPU or ICACHE.

Note that once configured, the configuration applies for both CPU0 and CPU1.

ESP32-S3 uses the register described in Table 13-4 to allocate the SRAM0 to either CPU or ICACHE:

Table 13-4. Internal SRAM0 Usage Configuration

	Block	PMS_INTERNAL_SRAM_USAGE_1_REG ^A
SRAM	Block0	[0] ^B
	Block1	[1]

^A Set this bit to allocate a certain block to CPU. Clear this bit to allocate a certain block to ICACHE.

^B For example, setting this bit indicates Block0 is allocated to CPU.

When a certain block is allocated to CPU, ESP32-S3 uses the registers listed in Table 13-5 to configure the instruction execution (X), write (W) and read (R) accesses of CPU's IBUS, from the Secure World and Non-secure World, to this block:

Table 13-5. Access Configuration to Internal SRAM0

Bus ^A	From World	Configuration Registers ^B	SRAM0		Access
			Block0	Block1	
IBUS	Secure World	PMS_CORE_X_IRAM0_PMS_CONSTRIN_2_REG	[14:12] ^C	[17:15]	X/W/R
	Non-secure World	PMS_CORE_X_IRAM0_PMS_CONSTRIN_1_REG	[14:12]	[17:15]	X/W/R

^A To access the Internal SRAM0, CPU must be configured with both the [usage](#) permission and respective access permission.

^B 1: with access; 0: without access

^C For example, configuring this field to 0b101 indicates CPU's IBUS is granted with instruction execution and read accesses but not write access to SRAM Block0 from the Non-secure World.

13.3.2.3 Internal SRAM1 Access Configuration

ESP32-S3's Internal SRAM1 includes Block2 ~ Block8 (see details in Table 13-3) and can be:

- Accessed by CPU's DBUS, IBUS and GDMA at the same time
- Can be configured to be used as Trace memory
- Further split into up to 6 regions with independent access management for more flexible permission control.

ESP32-S3's Internal SRAM1 can be further split into up to 6 regions with 5 split lines. Users can configure different access to each region independently.

To be more specific, the Internal SRAM1 can be first split into Instruction Region and Data Region by IRam0_DRam0_split_line:

- Instruction Region:
 - Then the Instruction Region should be only configured to be accessed by IBUS;
 - And can be further split into three split regions by IRam0_split_line_0 and IRam0_split_line_1.
- Data Region:
 - The Data Region should be only configured to be accessed by DBUS;
 - And can be further split into three split regions by DRam0_split_line_0 and DRam0_split_line_1.

See illustration in Figure 13-1 and Table 13-6 below.

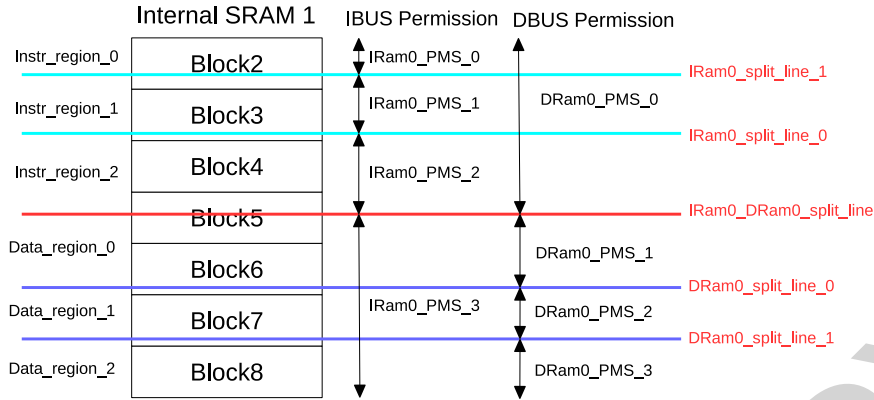

Figure 13-1. Split Lines for Internal SRAM1

Table 13-6. Internal SRAM1 Split Regions

Internal Memory ^A	Instruction / Data Regions	Split Regions ^B
SRAM1	Instruction Region	Instr_Region_0
		Instr_Region_1
		Instr_Region_2
	Data Region	Data_Region_0
		Data_Region_1
		Data_Region_2

^A See description below on how to configure the split lines.

^B Access to each split region can be configured independently. See details in Table 13-7 and 13-8.

Internal SRAM1 Split Regions

ESP32-S3 allows users to configure the split lines to their needs with registers below:

- Split line to split the Instruction and Data regions (IRam0_DRam0_split_line):
 - [PMS_CORE_X_IRAM0_DRAM0_DMA_SPLIT_LINE_CONSTRAIN_1_REG](#)
- The first split line to further split the Instruction Region (IRam0_split_line_0):
 - [PMS_CORE_X_IRAM0_DRAM0_DMA_SPLIT_LINE_CONSTRAIN_2_REG](#)
- The second split line to further split the Instruction Region (IRam0_split_line_1):
 - [PMS_CORE_X_IRAM0_DRAM0_DMA_SPLIT_LINE_CONSTRAIN_3_REG](#)
- The first split line to further split the data Region (DRam0_split_line_0):
 - [PMS_CORE_X_IRAM0_DRAM0_DMA_SPLIT_LINE_CONSTRAIN_4_REG](#)
- The second split line to further split the data Region (DRam0_split_line_1):
 - [PMS_CORE_X_IRAM0_DRAM0_DMA_SPLIT_LINE_CONSTRAIN_5_REG](#)

When configuring the split lines,

1. First configure the block in which the split line is by:

- Configuring the Category_x field for the block in which the split line is to 0x1 or 0x2 (no difference)
- Configuring the Category₀ ~ Category_{x-1} fields for all the preceding blocks to 0x0
- Configuring the Category_{x+1} ~ Category₆ fields for all blocks afterwards to 0x3

For example, assuming you want to configure the split line in Block5, then first configure the Category₃ field for Block5 to 0x1 or 0x2; configure the Category₀ ~ Category₂ fields for Block2 ~ Block4 to 0x0; and configure the Category₄ ~ Category₆ fields for Block6 ~ Block8 to 0x3 (see illustration in Figure 13-2). On the other hand, when reading 0x1 or 0x2 from Category₃, then you know the split line is in Block5.

2. Configure the position of the split line inside of the configured block by:

- Writing the [15:8] bits of the actual address at which you want to split the memory to the `SPLITADDR` field for the block in which the split line is.
- Note that the split address must be aligned to 256 bytes, meaning you can only write the integral multiples of 0x100 to the `SPLITADDR` field.

For example, if you want to split the instruction region at 0x3fc88000, then write the [15:8] bits of this address, which is 0b10000000, to `SPLITADDR`.

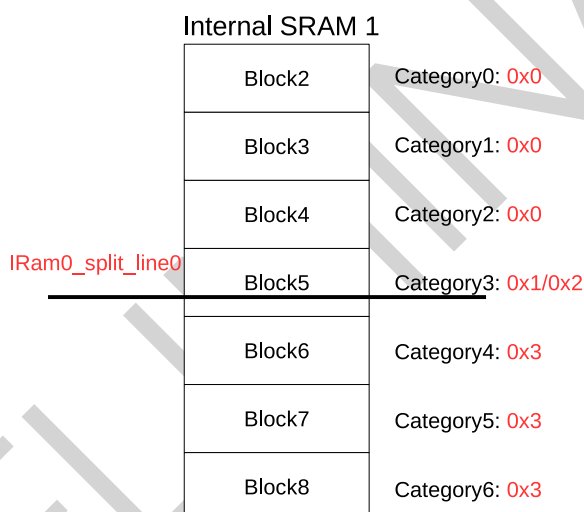

Figure 13-2. An illustration of Configuring the Category fields

Note the following points when configuring the split lines:

- Position:
 - The split line that splitting the Instruction Region and Data Region can be configured anywhere inside Internal SRAM1.
 - The two split lines further splitting the Instruction Region into 3 split regions must stay inside the Instruction Region.
 - The two split lines further splitting the Data Region into 3 split regions must stay inside the Data Region.
- Split lines can overlap with each other. For example,
 - When the two split lines inside the Data Region are not overlapping with each other, then the Data Region is split into 3 split regions

- When the two split lines inside the Data Region are overlapping with each other, then the Data Region is only split into 2 split regions
- When the two split lines inside the Data Region are not only overlapping with each other but also with the split line that splits the Data Region and the Instruction Region, then the Data Region is not split at all and only has one region.

Access Configuration

After configuring the split lines, users can then use the registers described in the Table 13-7 and Table 13-8 below to configure the access of CPU's IBUS, DBUS and GDMA peripherals, from the Secure World and Non-secure World, to these split regions independently.

Table 13-7. Access Configuration to the Instruction Region of Internal SRAM1

Buses	From World	Configuration Registers	Instruction Region			Access
			instr_region_0	instr_region_1	instr_region_2	
IBUS	Secure World	PMS_CORE_X_IRAM0_PMS_CONSTRRAIN_2_REG	[2:0]	[5:3]	[8:6]	X/W/R
	Non-secure World	PMS_Core_X_IRAM0_PMS_CONSTRRAIN_1_REG	[2:0]	[5:3]	[8:6]	X/W/R
DBUS	Secure World	PMS_Core_X_DRAM0_PMS_CONSTRRAIN_1_REG	[1:0] ^A			W/R
	Non-secure World		[13:12] ^A			W/R
GDMA	XX Peripherals ^C	PMS_DMA_APBPERI_XX_PMS_CONSTRRAIN_1_REG	[1:0] ^B			W/R

^A Configure DBUS' access to the Instruction Region. However, it's recommended to configure these bits to 0.

^B Configure GDMA's access to the Instruction Region. However, it's recommended to configure these bits to 0.

^C ESP32-S3 has 9 peripherals, including SPI2, SPI3, UCHI0, I2S0, I2S1, AES, SHA, ADC, LCD_CAM, USB, SDIO_HOST, and RMT, which can access Internal SRAM1 via GDMA. Each peripherals can be configured with different access to the Internal SRAM1 independently.

Table 13-8. Access Configuration to the Data Region of Internal SRAM1

Buses	From World	Configuration Registers	Data Region			Access
			data_region_0	data_region_1	data_region_2	
IBUS	Secure World	PMS_CORE_X_IRAM0_PMS_CONSTRRAIN_2_REG	[11:9] ^A			X/W/R
	Non-secure World	PMS_CORE_X_IRAM0_PMS_CONSTRRAIN_1_REG	[11:9] ^A			X/W/R
DBUS	Secure World	PMS_Core_X_DRAM0_PMS_CONSTRRAIN_1_REG	[3:2]	[5:4]	[7:6]	W/R
	Non-secure World		[15:14]	[17:16]	[19:18]	W/R
GDMA	XX ^B	PMS_DMA_APBPERI_XX_PMS_CONSTRRAIN_1_REG	[3:2]	[5:4]	[7:6]	W/R

^A Configure IBUS' access to the Data Region. However, it's recommended to configure these bits to 0.

^B ESP32-S3 has 9 peripherals, including SPI2, SPI3, UCHI0, I2S0, I2S1, AES, SHA, ADC, LCD_CAM, USB, SDIO_HOST, and RMT, which can access Internal SRAM1 via GDMA. Each peripherals can be configured with different access to the Internal SRAM1 independently.

For details on how to configure the split lines, see Section 13.3.2.3.

Trace Memory

ESP32-S3 has a low-power Xtensa® dual-core 32-bit LX7 microprocessor, which integrates a TRAX (Real-time Trace) module for easier debugging. For the TRAX module to work, users need to allocate 16 KB from the Internal SRAM1 as Trace memory. Note that, the Trace memories for CPU0 and CPU1 can be configured independently.

Users can allocate 16 KB from Internal SRAM1 as Trace memory by configuring the [PMS_INTERNAL_SRAM_USAGE_2_REG](#) register.

Detailed steps are provided below:

1. First choose a block from Block2 ~ Block8 by writing 1 to the respective bit in the [PMS_INTERNAL_SRAM_CORE_m_TRACE_USAGE](#) field

- Block2: 0b00000001
- Block3: 0b00000010
- Block4: 0b00000100
- Block5: 0b00001000
- Block6: 0b00010000
- Block7: 0b00100000
- Block8: 0b01000000

2. Then choose 16 KB from this block as the Trace memory by configuring the [PMS_INTERNAL_SRAM_CORE_m_TRACE_ALLOC](#) field

- 2'b00: the first 16 KB
- 2'b01: the second 16 KB
- 2'b10: the third 16 KB
- 2'b11: the fourth 16 KB

Note that Block2 is only 32 KB, so you can only configure this field to 2'b00 or 2'b0 when Block2 is selected in the first step.

For example, if you want to choose the first 16 KB of Internal SRAM1 Block3's as CPU0's trace memory, then you need to:

- Write 0b0000010 to the [PMS_INTERNAL_SRAM_CORE0_TRACE_USAGE](#) field to select Block3
- Write 2'b00 to the [PMS_INTERNAL_SRAM_CORE0_TRACE_ALLOC](#) field to select the first 16 KB.

13.3.2.4 Internal SRAM2 Access Configuration

ESP32-S3's Internal SRAM2 includes Block9 and Block10 (see details in Table 13-3), which can be allocated to either CPU/GDMA or DCACHE. Note that once configured, the configuration applies to both CPU0 and CPU1.

ESP32-S3 uses registers described in Table 13-9 to configure the Internal SRAM2 for CPU/GDMA or DCACHE.

Table 13-9. Internal SRAM2 Usage Configuration

	Block	PMS_INTERNAL_SRAM_USAGE_1_REG ^A
SRAM	Block9 ^B	[3]
	Block10	[2]

^A Set this bit to allocate a certain block to CPU/GDMA. Clear this bit to allocate a certain block to DCACHE.

^B For example, setting this bit indicates Block9 is allocated to CPU/GDMA.

When a certain block is allocated to CPU/GDMA, ESP32-S3 uses the registers listed in Table 13-10 to configure the write (W) and read (R) accesses of CPU's DBUS, from the Secure World and Non-secure World, to this block:

Table 13-10. Access Configuration to Internal SRAM2

Bus ^A	From World	Configuration Registers	SRAM2		Access ^B
			Block9	Block10	
DBUS	Secure World	PMS_CORE_X_DRAM0_PMS_CONSTRAIN_1_REG	[9:8] ^C	[11:10]	W/R
	Non-secure World	PMS_CORE_X_DRAM0_PMS_CONSTRAIN_1_REG	[21:20]	[23:22]	W/R
GDMA	XX Peripherals ^B	PMS_DMA_APBPERI_XX_PMS_CONSTRAIN_1_REG	[9:8]	[11:10]	W/R

^A To access the Internal SRAM2, the CPU / GDMA must be configured with both the [usage](#) permission and respective access permission.

^B 1: with access; 0: without access

^C For example, configuring this field to 0b10 indicates CPU's DBUS is granted with write access but not read access from the Secure World to the Block9 of Internal SRAM2.

13.3.3 RTC FAST Memory

13.3.3.1 Address

ESP32-S3's RTC FAST Memory is 8 KB. See the address of RTC FAST Memory below:

Table 13-11. RTC FAST Memory Address

Memory	Starting Address	Ending Address
RTC FAST Memory	0x600F_E000	0x600F_FFFF

13.3.3.2 Access Configuration

ESP32-S3's RTC FAST Memory can be further split into 2 regions. Each split region can be configured independently with different access by configuring respective registers ([PMS_CORE_m_PIF_PMS_CONSTRAIN_n_REG](#)).

Note that split regions can be configured independently for CPU0 and CPU1 and for the Secure World and Non-secure World.

The Register for configuring the split line is described below:

Table 13-12. Split RTC FAST Memory into the Higher Region and the Lower Region

Memory	Split Regions	Configuration Register ¹	
		Secure World	Non-secure World
RTC FAST Memory	Higher Region	PIF_PMS_CONSTRAN_9_REG [10:0]	PIF_PMS_CONSTRAN_9_REG [21:11]
	Lower Region		

¹ The offset from the RTC FAST Memory base address should be used when configuring the split address. For example, if you want to split the RTC FAST Memory at 0x600F_F000, then write 0x1000 to this register.

Access configuration for the higher and lower regions of the RTC FAST Memory is described below:

Table 13-13. Access Configuration to the RTC FAST Memory

Bus	RTC FAST Memory	Configuration Registers		Access ^A
		Secure World	Non-secure World	
Peri Bus (PIF)	Higher Region	PIF_PMS_CONSTRAN_10_REG [5:3] ^B	PIF_PMS_CONSTRAN_10_REG [11:9]	X/W/R
	Lower Region	PIF_PMS_CONSTRAN_10_REG [2:0]	PIF_PMS_CONSTRAN_10_REG [8:6]	

^A 1: with access; 0: without access

^B For example, configuring this field to 0b101 indicates CPU's peripheral (PIF) bus is granted with the instruction execution and read accesses but not the read access from the Secure WORLD to the higher region of RTC FAST Memory.

13.3.4 RTC SLOW Memory

13.3.4.1 Address

ESP32-S3's RTC SLOW Memory is 8 KB. This memory can be accessed using two addresses, i.e., RTCSlow_0 and RTCSlow_1. See details in Table 13-14 below:

Table 13-14. RTC SLOW Memory Address

RTC SLOW Memory	Starting Address	Ending Address
RTCSlow_0	0x5000_0000	0x5000_1FFF
RTCSlow_1	0x6002_1000	0x6002_2FFF

13.3.4.2 Access Configuration

Both ESP32-S3's RTCSlow_0 and RTCSlow_1 can be further split into 2 regions. Each split region can be configured independently with different access by configuring respective registers ([PMS_CORE_m_PIF_PMS_CONSTRAN_n_REG](#)).

Note that split regions can be configured independently for CPU0 and CPU1 and for the Secure World and Non-secure World.

The registers for splitting RTC SLOW Memory into 4 split regions are described below:

Table 13-15. Split RTCSlow_0 and RTCSlow_1 into Split Regions

Memory	Split Regions	Configuration Registers ¹	
		Secure World	Non-secure World
RTCSlow_0	Higher Region	PIF_PMS_CONSTRAN_11_REG [10:0]	PIF_PMS_CONSTRAN_9_REG [21:11]
	Lower Region		
RTCSlow_1	Higher Region	PIF_PMS_CONSTRAN_13_REG [10:0]	PIF_PMS_CONSTRAN_13_REG [21:11]
	Lower Region		

¹ The offset from the RTC SLOW Memory base address should be used when configuring the split address. For example, if you want to split the RTC SLOW Memory at 0x6002_2000, then write 0x1000 to this register.

Access configuration to the split regions of RTC SLOW Memory is described below:

Table 13-16. Access Configuration to the RTC SLOW Memory

Bus	Mem	Split Regions	Configuration Registers		Access
			Secure World	Non-secure World	
Peri	RTC Slow_0	Higher ^A	PIF_PMS_CONSTRAN_12_REG [5:3] ^C	PIF_PMS_CONSTRAN_12_REG [11:9]	X/W/R
		Lower ^B	PIF_PMS_CONSTRAN_12_REG [2:0]	PIF_PMS_CONSTRAN_12_REG [8:6]	
Bus (PIF)	RTC Slow_1	Higher ^A	PIF_PMS_CONSTRAN_14_REG [5:3]	PIF_PMS_CONSTRAN_14_REG [11:9]	
		Lower ^B	PIF_PMS_CONSTRAN_14_REG [2:0]	PIF_PMS_CONSTRAN_14_REG [8:6]	

^A Higher is short for Higher Region.

^B Lower is short for Lower Region.

^C For example, configuring this field to 0b100 indicates CPU's peripheral (PIF) bus is granted with the instruction execution access but not the write or read accesses from the Secure WORLD to the higher region of RTCSLOW_0.

13.4 Peripherals

13.4.1 Access Configuration

ESP32-S3's CPU can be configured with different read (R) and write (W) accesses to most of its modules and peripherals independently, from the Secure World and the Non-secure World, by configuring respective registers ([PMS_CORE_m_PIF_PMS_CONSTRAN_n_REG](#)).

Note that permission to modules and peripherals can be configured independently for CPU0 and CPU1 and for the Secure World and Non-secure World.

Notes on [PMS_CORE_m_PIF_PMS_CONSTRAN_n_REG](#):

- *m* can be 0 or 1 for CPU0 and CPU1 respectively.
- *n* can be 1~8, in which 1~4 are for Secure World and 5~8 are for Non-secure World.

For example, users can configure [PMS_CORE_0_PIF_PMS_CONSTRAN_1_REG \[1:0\]](#) to 0x2, meaning CPU0 is granted with read access but not write access from the Secure World to UART0. In this case, CPU0 won't be able to modify the UART0's internal registers when in Secure World.

Table 13-17. Access Configuration of the Peripherals

Peripherals	Secure World	Non-secure World	Bit ³
GDMA	PIF_PMS_CONSTRAN_4_REG	PIF_PMS_CONSTRAN_8_REG	[7:6]
eFuse Controller & PMU ²	PIF_PMS_CONSTRAN_1_REG	PIF_PMS_CONSTRAN_5_REG	[15:14]
IO_MUX	PIF_PMS_CONSTRAN_1_REG	PIF_PMS_CONSTRAN_5_REG	[17:16]
GPIO	PIF_PMS_CONSTRAN_1_REG	PIF_PMS_CONSTRAN_5_REG	[7:6]

¹ : Accelerators: AES, SHA, RSA, Digital Signatures, HMAC

² : This is shared by more than one peripherals.

³ : Access: R/W

13.4.2 Split Peripheral Regions into Split Regions

Each of ESP32-S3's peripheral region can be further split into 11 regions (from Peri Region0 ~ Peri Region10) for more flexible permission control.

For example, the registers for ESP32-S3's GDMA controller are allocated as:

- 5 sets of registers for 5 of each RX channel
- 5 sets of registers for 5 of each TX channel
- 1 set of registers for configuration

As seen above, GDMA's peripheral region is divided into 11 split regions (implemented in hardware), which can be configured with different permission independently, thus achieving independent permission control to each GDMA channel.

Users can configure CPU's read (R) and write (W) accesses to a specific split region (Peri Region n) from the Secure World and the Non-secure World by configuring `PMS_CORE_m_Region_PMS_CONSTRAN_n_REG`. Note that permission can be configured independently for CPU0 and CPU1.

Notes on `PMS_CORE_m_Region_PMS_CONSTRAN_n_REG`:

- m can be 0 or 1 for CPU0 and CPU1 respectively.
- n can be 1~14, in which
 - `Region_PMS_CONSTRAN_1_REG` is for configuring CPU's permission from the Secure World.
 - `Region_PMS_CONSTRAN_2_REG` is for configuring CPU's permission from the Non-secure World.
 - `Region_PMS_CONSTRAN_n_REG` $n = 3\sim 14$ are used to configuring the starting addresses for each Peri Regions. Note the starting address of each Peri Region is also the ending address of the previous Peri Region.

Table 13-18. Access Configuration of Peri Regions

Peri Regions	Starting Address Configuration	Access Configuration	
		Secure World	Non-secure World
Peri Region0	<code>Region_PMS_CONSTRAN_3_REG</code>	<code>Region_PMS_CONSTRAN_1_REG</code> [1:0]	<code>Region_PMS_CONSTRAN_2_REG</code> [1:0]
Peri Region1	<code>Region_PMS_CONSTRAN_4_REG</code>	<code>Region_PMS_CONSTRAN_1_REG</code> [3:2]	<code>Region_PMS_CONSTRAN_2_REG</code> [3:2]
Peri Region2	<code>Region_PMS_CONSTRAN_5_REG</code>	<code>Region_PMS_CONSTRAN_1_REG</code> [5:4]	<code>Region_PMS_CONSTRAN_2_REG</code> [5:4]
Peri Region3	<code>Region_PMS_CONSTRAN_6_REG</code>	<code>Region_PMS_CONSTRAN_1_REG</code> [7:6]	<code>Region_PMS_CONSTRAN_2_REG</code> [7:6]
Peri Region4	<code>Region_PMS_CONSTRAN_7_REG</code>	<code>Region_PMS_CONSTRAN_1_REG</code> [9:8]	<code>Region_PMS_CONSTRAN_2_REG</code> [9:8]
Peri Region5	<code>Region_PMS_CONSTRAN_8_REG</code>	<code>Region_PMS_CONSTRAN_1_REG</code> [11:10]	<code>Region_PMS_CONSTRAN_2_REG</code> [11:10]
Peri Region6	<code>Region_PMS_CONSTRAN_9_REG</code>	<code>Region_PMS_CONSTRAN_1_REG</code> [13:12]	<code>Region_PMS_CONSTRAN_2_REG</code> [13:12]
Peri Region7	<code>Region_PMS_CONSTRAN_10_REG</code>	<code>Region_PMS_CONSTRAN_1_REG</code> [15:14]	<code>Region_PMS_CONSTRAN_2_REG</code> [15:14]
Peri Region8	<code>Region_PMS_CONSTRAN_11_REG</code>	<code>Region_PMS_CONSTRAN_1_REG</code> [17:16]	<code>Region_PMS_CONSTRAN_2_REG</code> [17:16]
Peri Region9	<code>Region_PMS_CONSTRAN_12_REG</code>	<code>Region_PMS_CONSTRAN_1_REG</code> [19:18]	<code>Region_PMS_CONSTRAN_2_REG</code> [19:18]
Peri Region10	<code>Region_PMS_CONSTRAN_13_REG</code>	<code>Region_PMS_CONSTRAN_1_REG</code> [21:20]	<code>Region_PMS_CONSTRAN_2_REG</code> [21:20]

13.5 External Memory

ESP32-S3 can access the external memory via one of the three ways illustrated in Figure 13-3 below.

- CPU via SPI1
- CPU via CACHE
- GDMA

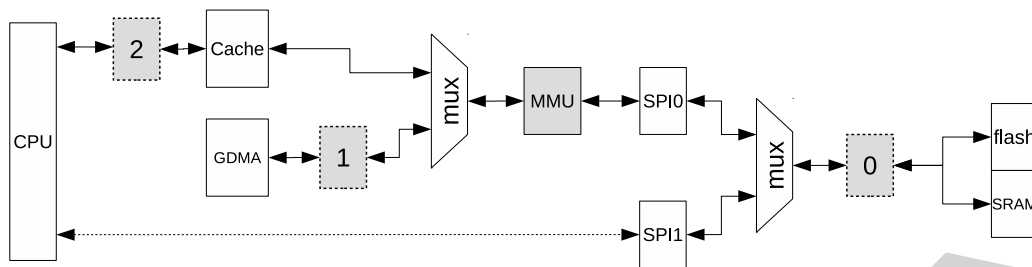

Figure 13-3. Three Ways to Access External Memory

SPI1, CACHE or GDMA must be configured with specific permission before accessing external memory. see illustration in Figure 13-3:

- Box 0 checks the CPU's access to external flash and SRAM
- Box 1 checks GDMA's access to external SRAM
- Box 2 checks CPU's access to external flash and SRAM via CACHE

13.5.1 Address

Both ESP32-S3's flash and SRAM can be further split to achieve more flexible permission control. Each split region can be configured with different access independently.

- Flash can be split into 4 regions, the length of each should be the integral multiples of 64 KB.
- SRAM can be split into 4 regions, the length of each should be the integral multiples of 64 KB.
- Also, the starting address of each region should also be aligned to 64 KB.

The following registers can be used to configure how the flash or SRAM are split.

Table 13-19. Split the External Memory into Split Regions

Split Regions	Split Region Configuration ³	
	Starting Address ¹	Length ²
Flash Region n (n : 0~3)	APB_CTRL_FLASH_ACE_n_ADDR_REG	APB_CTRL_FLASH_ACE_n_SIZE_REG
SRAM Region n (n : 0~3)	APB_CTRL_SRAM_ACE_n_ADDR_REG	APB_CTRL_SRAM_ACE_n_SIZE_REG

¹ Configuring this field with the actual address, which should be aligned to 64 KB.

² When configuring the length of Region n , note the total length of all flash or SRAM regions should be less than 1 GB, respectively.

³ Each region cannot overlap with others.

13.5.2 Access Configuration

Each split regions for flash and SRAM can be configured with different permission independently via Registers [APB_CTRL_SRAM_ACE \$n\$ _ATTR_REG](#) and [APB_CTRL_FLASH_ACE \$n\$ _ATTR](#).

Table 13-20. Access Configuration of External Memory Regions

Split Regions	Access Configuration			
	Configuration Registers	Secure World ^A	Non-secure World ^A	SPI1 Access ^B
Flash Region n (n : 0 ~ 3)	APB_CTRL_FLASH_ACE n _ATTR	[2:0] ^C	[5:3]	[7:6] ^D
SRAM Region n (n : 0 ~ 3)	APB_CTRL_SRAM_ACE n _ATTR_REG	[2:0]	[5:3]	[7:6]

^A These bits are configured in order W/R/X

^B These bits are configured in order W/R

^C For example, configuring this field to 0b010 indicates CACHE is granted with the read access but not the write or instruction execution accesses from the Secure WORLD to the Flash Region n .

^D For example, configuring this field to 0b01 indicates SPI is granted with the read access but not the write access to the Flash Region n .

13.5.3 GDMA

ESP32-S3's 32 MB External SRAM can be independently split into four regions, of which the Region1 and Region2 are accessible to GDMA.

Table 13-21. Split the External SRAM into Four Split Regions for GDMA

Split Regions	Starting Address (included)	Ending Address (not included) ²
Region0 ³	0x3C000000	PMS_EDMA_BOUNDARY_0_REG ^{1,2}
Region1 ⁴	PMS_EDMA_BOUNDARY_0_REG ¹	PMS_EDMA_BOUNDARY_1_REG ^{1,2}
Region2 ⁴	PMS_EDMA_BOUNDARY_1_REG ¹	PMS_EDMA_BOUNDARY_2_REG ^{1,2}
Region3 ³	PMS_EDMA_BOUNDARY_2_REG ¹	0x3E000000 ²

¹ When configuring this register, note that you need to write an offset to 0x3C000000 and the unit is 4 KB. For example, configuring the register to 0x80 means that the address is 0x3C000000 + 0x80 * 4KB = 0x3C080000.

² The address value filled here is the Ending address plus one. For example, 0x3E000000 means that the end address is 0x3DFFFFFF.

³ This region cannot be accessed by peripherals via GDMA.

⁴ This region can be accessed by some peripherals via GDMA, including SPI2, SPI3, UHCI0, I2S0, I2S1, Camera-LCD Controller, AES, SHA, ADC Controller, and Remote Control Peripheral. See details below.

Users can use the registers below to configure peripherals' access to the second and third External SRAM regions via GDMA.

Table 13-22. Access Configuration of External SRAM via GDMA

Peripherals	Access Configuration		
	Region1	Region2	Access
SPI2	PMS_EDMA_PMS_SPI2_ATTR1	PMS_EDMA_PMS_SPI2_ATTR2	W/R
SPI3	PMS_EDMA_PMS_SPI3_ATTR1	PMS_EDMA_PMS_SPI3_ATTR2	
UHCI0	PMS_EDMA_PMS_UHCI0_ATTR1	PMS_EDMA_PMS_UHCI0_ATTR2	
I2S0	PMS_EDMA_PMS_I2S0_ATTR1	PMS_EDMA_PMS_I2S0_ATTR2	
I2S1	PMS_EDMA_PMS_I2S1_ATTR1	PMS_EDMA_PMS_I2S1_ATTR2	
Camera-LCD Controller	PMS_EDMA_PMS_LCD_CAM_ATTR1	PMS_EDMA_PMS_LCD_CAM_ATTR2	
AES	PMS_EDMA_PMS_AES_ATTR1	PMS_EDMA_PMS_AES_ATTR2	
SHA	PMS_EDMA_PMS_SHA_ATTR1 ^A	PMS_EDMA_PMS_SHA_ATTR2	
ADC Controller	PMS_EDMA_PMS_ADC_DAC_ATTR1	PMS_EDMA_PMS_ADC_DAC_ATTR2	
Remote Control Peripheral	PMS_EDMA_PMS_RMT_ATTR1	PMS_EDMA_PMS_RMT_ATTR2	

^A For example, configuring this field to 0b10 indicates SHA is granted with the write access but not the read access via GDMA to SRAM Region1.

13.6 Unauthorized Access and Interrupts

Any attempt to access ESP32-S3's slave device without configured permission is considered an **unauthorized access** and will be handled as described below:

- This attempt will only be responded with default values, in particular,
 - All instruction execution or read attempts will be responded with 0 (for internal memory) or 0xdeadbeaf (for external memory)
 - All write attempts will fail
- An interrupt will be triggered (when enabled). See details below.

Note that:

- All permission control related interrupts described in this section can be independently configured for CPU0 and CPU1.
- Only the information of the first interrupt is logged. Therefore, it's advised to handle interrupt signals and clear interrupts in-time, so the information of next interrupt can be logged correctly.

13.6.1 Interrupt upon Unauthorized IBUS Access

ESP32-S3 can be configured to trigger interrupts when IBUS attempts to access internal ROM and SRAM without configured permission, and log the information about this unauthorized access. Note that, once this interrupt is enabled, it's enabled for all internal ROM and SRAM memory, and cannot be only enabled for a certain address field. This interrupt corresponds to the CORE_m_IRAM0_PMS_MONITOR_VIOLATE_INTR interrupt source described in Table 8-1 from Chapter 8 *Interrupt Matrix (INTERRUPT)*.

Table 13-23. Interrupt Registers for Unauthorized IBUS Access

Registers	Bit	Description
PMS_CORE_m_IRAM0_PMS_MONITOR_1_REG	[0]	Clears interrupt signal
	[1]	Enables interrupt
PMS_CORE_m_IRAM0_PMS_MONITOR_2_REG	[0]	Stores interrupt status of unauthorized IBUS access
	[1]	Stores the access direction. 1: write; 0: read.
	[2]	Stores the instruction direction. 1: load/store; 0: instruction execution.
	[4:3]	Stores the world the CPU was in when the unauthorized IBUS access happened. 0b01: Secure World; 0b10: Non-secure World
	[28:5]	Stores the address that CPU's IBUS was trying to access unauthorized.

13.6.2 Interrupt upon Unauthorized DBUS Access

ESP32-S3 can be configured to trigger interrupts when DBUS attempts to access internal ROM and SRAM without configured permission, and log the information about this unauthorized access. Note that, once this interrupt is enabled, it's enabled for all internal ROM and SRAM memory, and cannot be only enabled for a certain address field. This interrupt corresponds to the CORE_m_DRAM0_PMS_MONITOR_VIOLATE_INTR interrupt source described in Table 8-1 from Chapter 8 *Interrupt Matrix (INTERRUPT)*.

Table 13-24. Interrupt Registers for Unauthorized DBUS Access

Registers	Bit	Description
PMS_CORE_m_DRAM0_PMS_MONITOR_1_REG	[0]	Clears interrupt signal
	[1]	Enables interrupt
PMS_CORE_m_DRAM0_PMS_MONITOR_2_REG	[0]	Stores interrupt status of unauthorized DBUS access
	[1]	Flags atomic access. 1: atomic access; 0: not atomic access.
	[3:2]	Stores the world the CPU was in when the unauthorized DBUS access happened. 0b01: Secure World; 0b10: Non-secure World
	[25:4]	Stores the address that CPU's DBUS was trying to access unauthorized.
PMS_CORE_m_DRAM0_PMS_MONITOR_3_REG	[0]	Stores the access direction. 1: write; 0: read.
	[25:4]	Stores the byte information of the unauthorized DBUS access.

13.6.3 Interrupt upon Unauthorized Access to External Memory

ESP32-S3 can be configured to trigger Interrupt upon unauthorized access to external memory, and log the information about this unauthorized access. This interrupt corresponds to the SPI_MEM_REJECT_INTR interrupt source described in Table 8-1 from Chapter 8 *Interrupt Matrix (INTERRUPT)*.

Table 13-25. Interrupt Registers for Unauthorized Access to External Memory

Registers	Bit	Description
APB_CTRL_SPI_MEM_PMS_CTRL_REG	[0]	Stores exception signal
	[1]	Clears exception signal and logged information
	[2]	Indicates unauthorized instruction execution
	[3]	Indicates unauthorized read
	[4]	Indicates unauthorized write
	[5]	Indicates overlapping split regions
	[6]	Indicates invalid address

13.6.4 Interrupt upon Unauthorized Access to Internal Memory via GDMA

ESP32-S3 can be configured to trigger Interrupt upon unauthorized access to internal memory via GDMA, and log the information about this unauthorized access. This interrupt corresponds to the DMA_APB_PMS_MONITOR_VIOLATE_INTR interrupt source described in Table 8-1 from Chapter 8 *Interrupt Matrix (INTERRUPT)*.

Table 13-26. Interrupt Registers for Unauthorized Access to Internal Memory via GDMA

Registers	Bit	Description
PMS_DMA_APBPERI_PMS_MONITOR_1_REG	[0]	Clears interrupt signal
	[1]	Enables interrupt
PMS_DMA_APBPERI_PMS_MONITOR_2_REG	[0]	Stores interrupt signal
	[2:1]	Stores the world the CPU was in when the unauthorized access happened. 0b01: Secure World; 0b10: Non-secure World
	[24:3]	Stores the address that GDMA was trying to access unauthorized
PMS_DMA_APBPERI_PMS_MONITOR_3_REG	[0]	Stores the access direction. 1: write; 0: read
	[16:1]	Stores the byte information of unauthorized access

For information about Interrupt upon unauthorized access to external memory via GDMA, please refer to Chapter 2 *GDMA Controller (GDMA)*.

13.6.5 Interrupt upon Unauthorized peripheral bus (PIF) Access

ESP32-S3 can be configured to trigger interrupts when PIF attempts to access RTC FAST memory, RTC SLOW memory, and peripheral regions without configured permission, and log the information about this unauthorized access. Note that, once this interrupt is enabled, it's enabled for all RTC FAST memory, RTC SLOW memory, and peripheral regions, and cannot be only enabled for a certain address field. This interrupt corresponds to the CORE_m_PIF_PMS_MONITOR_VIOLATE_INTR interrupt source described in Table 8-1 from Chapter 8 *Interrupt Matrix (INTERRUPT)*.

Table 13-27. Interrupt Registers for Unauthorized PIF Access

Registers	Bit	Description
PMS_CORE_m_PIF_PMS_MONITOR_1_REG	[1]	Enables interrupt
	[0]	Clears interrupt signal and logged information
PMS_CORE_m_PIF_PMS_MONITOR_2_REG	[7:6]	Stores the world the CPU was in when the unauthorized PIF access happened. 0b01: Secure World; 0b10: Non-secure World
	[5]	Stores the access direction. 1: write; 0: read
	[4:2]	Stores the data type of unauthorized access. 0: byte; 1: half-word; 2: word
	[1]	Stores the access type. 0: instruction; 1: data
	[0]	Stores the interrupt signal
PMS_CORE_m_PIF_PMS_MONITOR_3_REG	[31:0]	Stores the address of unauthorized access

In particular, ESP32-S3 can also be configured to check the access alignment when PIF attempts to access the peripheral regions, and trigger Interrupt upon unauthorized alignment. See detailed description in the following section.

13.6.6 Interrupt upon Unauthorized PIF Access Alignment

Access to all of ESP32-S3's modules / peripherals (excluding RTC FAST memory and SLOW memory) is **word aligned**.

ESP32-S3 can be configured to check the access alignment to all modules / peripherals, and trigger Interrupt upon **non-word aligned access**.

This interrupt corresponds to the CORE_m_PIF_PMS_MONITOR_VIOLATE_SIZE_INTR interrupt source described in Table 8-1 from Chapter 8 *Interrupt Matrix (INTERRUPT)*.

Note that CPU can convert some non-world aligned access to word aligned access, thus avoiding triggering alignment interrupt.

Table 13-28 below lists all the possible access alignments and their results (when interrupt is enabled), in which:

- **INTR**: interrupt
- \checkmark : access succeeds and no interrupt.

Table 13-28. All Possible Access Alignment and their Results

Accessed Address	Access Alignment	Read	Write
0x0	Byte aligned	INTR	INTR
	Half-word aligned	INTR	INTR
	Word aligned	\checkmark	\checkmark
0x1	Byte aligned	INTR	INTR
	Half-word aligned	\checkmark	INTR
	Word aligned	\checkmark	INTR
0x2	Byte aligned	INTR	INTR
	Half-word aligned	INTR	INTR

Accessed Address	Access Alignment	Read	Write
	Word aligned	✓	INTR
0x3	Byte aligned	INTR	INTR
	Half-word aligned	✓	INTR
	Word aligned	✓	INTR

Table 13-29. Interrupt Registers for Unauthorized Access Alignment

Registers	Bit	Description
PMS_CORE_m_PIF_PMS_MONITOR_4_REG	[1]	Enables interrupt
	[0]	Clears interrupt signal and logged information
PMS_CORE_m_PIF_PMS_MONITOR_5_REG	[4:3]	Stores the world the CPU was in when the unauthorized access happened. 0b01: Secure World; 0b10: Non-secure World
	[2:1]	Stores the unauthorized access type. 0: byte aligned; 1: half-word aligned; 2: word aligned
	[0]	Stores the interrupt status. 0: no interrupt; 1: interrupt
PMS_CORE_m_PIF_PMS_MONITOR_6_REG	[31:0]	Stores the address of the unauthorized access

13.7 Protection of CPU VECBASE Registers

CPU's VECBASE registers store the base addresses of interrupts and exceptions table. To protect these registers from unauthorized modification, ESP32-S3 has implemented a special mechanism.

Users can first configure values stored in VECBASE registers to the `PMS_CORE_m_VECBASE_OVERRIDE_WORLDn_VALUE` field of the `PMS_CORE_m_VECBASE_OVERRIDE_n_REG` register, and then use the configured `PMS_CORE_m_VECBASE_OVERRIDE_WORLDn_VALUE` values, instead of VECBASE values. Then by only allowing modification to the `PMS_CORE_m_VECBASE_OVERRIDE_n_REG` register values from the Secure World, the integrity of values stored in VECBASE registers are protected.

The detailed steps are described below:

- Write the CPU_m's VECBASE value in Secure World to the `PMS_CORE_m_VECBASE_OVERRIDE_WORLD0_VALUE` field.
- Write the CPU_m's VECBASE value in Non-secure World to the `PMS_CORE_m_VECBASE_OVERRIDE_WORLD1_VALUE` field.
- Configure the `PMS_CORE_m_VECBASE_OVERRIDE_SEL` field of the `PMS_CORE_m_VECBASE_OVERRIDE_1_REG` register by setting it to:
 - 2'b00: just use CPU_m's VECBASE register directly.
 - 2'b11: use the value configured in `PMS_CORE_m_VECBASE_OVERRIDE_WORLDn_VALUE`, instead of the value in CPU_m's VECBASE register
 - Do not configuring this field to other values.
- Configure the `PMS_CORE_m_VECBASE_WORLD_MASK` field of the `PMS_CORE_m_VECBASE_OVERRIDE_0_REG` register by setting it to:

- 1: CPU m uses WORLD0_VALUE in both the Secure World and the Non-secure World.
- 0: CPU m uses WORLD0_VALUE in the Secure World, and WORLD1_VALUE in the Non-secure World.

13.8 Register Locks

All ESP32-S3's permission control related registers can be locked by respective lock registers. When the lock registers are configured to 1, these registers themselves and their related permission control registers are all protected from modification until the next CPU reset.

Note that there isn't one-to-one correspondence between the lock registers and permission control registers. See details in Table 13-30.

Table 13-30. Lock Registers and Related Permission Control Registers

Lock Registers	Related Permission Control Registers
VECBASE Configuration	
PMS_CORE m _VECBASE_OVERRIDE_LOCK_REG	PMS_CORE m _VECBASE_OVERRIDE_LOCK_REG
	PMS_CORE m _VECBASE_OVERRIDE_0_REG
	PMS_CORE m _VECBASE_OVERRIDE_1_REG

13.9 Register Summary

The addresses of registers starting from PMS in this section are relative to the Permission Control base address, and the addresses of registers starting from APB in this section are relative to the ABP Controller base address. Both base address are provided in Table 3-3 in Chapter 3 *System and Memory*.

Note that, all registers with CORE_X in this section apply to both CPUs. The list of registers below is for CPU0 only. CPU1 shares exactly the same set of registers. Adding 0x0400 to the offset of the equivalent of CPU0 register gives you address for CPU1 registers.

For example, the offset for CPU0 register [PMS_CORE_0_IRAM0_PMS_MONITOR_0_REG](#) is 0x00E4, the offset for CPU1 equivalent [PMS_CORE_1_IRAM0_PMS_MONITOR_0_REG](#) should be 0x00E4 + 0x0400, which is 0x04E4.

Name	Description	Address	Access
Configuration Register			
PMS_APB_PERIPHERAL_ACCESS_0_REG	APB peripheral configuration register 0	0x0008	R/W
PMS_APB_PERIPHERAL_ACCESS_1_REG	APB peripheral configuration register 1	0x000C	R/W
PMS_INTERNAL_SRAM_USAGE_0_REG	Internal SRAM configuration register 0	0x0010	R/W
PMS_INTERNAL_SRAM_USAGE_1_REG	Internal SRAM configuration register 1	0x0014	R/W
PMS_INTERNAL_SRAM_USAGE_2_REG	Internal SRAM configuration register 2	0x0018	R/W
PMS_DMA_APBPERI_SPI2_PMS_CONSTRRAIN_0_REG	SPI2 GDMA Permission Config Register 0	0x0038	R/W
PMS_DMA_APBPERI_SPI2_PMS_CONSTRRAIN_1_REG	SPI2 GDMA Permission Config Register 1	0x003C	R/W
PMS_DMA_APBPERI_SPI3_PMS_CONSTRRAIN_0_REG	SPI3 GDMA Permission Config Register 0	0x0040	R/W
PMS_DMA_APBPERI_SPI3_PMS_CONSTRRAIN_1_REG	SPI3 GDMA Permission Config Register 1	0x0044	R/W
PMS_DMA_APBPERI_UHCI0_PMS_CONSTRRAIN_0_REG	UHCI0 GDMA Permission Config Register 0	0x0048	R/W
PMS_DMA_APBPERI_UHCI0_PMS_CONSTRRAIN_1_REG	UHCI0 GDMA Permission Config Register 1	0x004C	R/W
PMS_DMA_APBPERI_I2S0_PMS_CONSTRRAIN_0_REG	I2S0 GDMA Permission Config Register 0	0x0050	R/W
PMS_DMA_APBPERI_I2S0_PMS_CONSTRRAIN_1_REG	I2S0 GDMA Permission Config Register 1	0x0054	R/W
PMS_DMA_APBPERI_I2S1_PMS_CONSTRRAIN_0_REG	I2S1 GDMA Permission Config Register 0	0x0058	R/W
PMS_DMA_APBPERI_I2S1_PMS_CONSTRRAIN_1_REG	I2S1 GDMA Permission Config Register 1	0x005C	R/W
PMS_DMA_APBPERI_AES_PMS_CONSTRRAIN_0_REG	AES GDMA Permission Config Register 0	0x0070	R/W
PMS_DMA_APBPERI_AES_PMS_CONSTRRAIN_1_REG	AES GDMA Permission Config Register 1	0x0074	R/W
PMS_DMA_APBPERI_SHA_PMS_CONSTRRAIN_0_REG	SHA GDMA Permission Config Register 0	0x0078	R/W
PMS_DMA_APBPERI_SHA_PMS_CONSTRRAIN_1_REG	SHA GDMA Permission Config Register 1	0x007C	R/W

Name	Description	Address	Access
PMS_DMA_APBPERI_ADC_DAC_PMS_CONSTRRAIN_0_REG	ADC_DAC GDMA Permission Config Register 0	0x0080	R/W
PMS_DMA_APBPERI_ADC_DAC_PMS_CONSTRRAIN_1_REG	ADC_DAC GDMA Permission Config Register 1	0x0084	R/W

13.10 Registers

The addresses of registers starting from PMS in this section are relative to the Permission Control base address, and the addresses of registers starting from APB in this section are relative to the ABP Controller base address. Both base address are provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 13.1. PMS_APB_PERIPHERAL_ACCESS_0_REG (0x0008)

PMS_APB_PERIPHERAL_ACCESS_LOCK Set this bit to lock APB peripheral configuration register. (R/W)

Register 13.2. PMS_APB_PERIPHERAL_ACCESS_1_REG (0x000C)

PMS_APB_PERIPHERAL_ACCESS_SPLIT_BURST Set this bit to allow the PIF bus to initiate back to back access to peripheral regions. (R/W)

Register 13.3. PMS_INTERNAL_SRAM_USAGE_0_REG (0x0010)

PMS_INTERNAL_SRAM_USAGE_LOCK Set this bit to lock internal SRAM Configuration Register. (R/W)

Register 13.5. PMS_INTERNAL_SRAM_USAGE_2_REG (0x0018)

(reserved)										PMS_INTERNAL_SRAM_CORE1_TRACE_ALLOC				PMS_INTERNAL_SRAM_CORE0_TRACE_ALLOC				PMS_INTERNAL_SRAM_CORE1_TRACE_USAGE				PMS_INTERNAL_SRAM_CORE0_TRACE_USAGE			
31								18	17	16	15	14	13					7	6					0	
0 0 0 0 0 0 0 0 0 0										0				0				0				Reset			

PMS_INTERNAL_SRAM_CORE0_TRACE_USAGE Configure this field to choose a certain block in SRAM1 as the trace memory block for CPU0. (R/W)

PMS_INTERNAL_SRAM_CORE1_TRACE_USAGE Configure this field to choose a certain block in SRAM1 as the trace memory block for CPU1. (R/W)

PMS_INTERNAL_SRAM_CORE0_TRACE_ALLOC Configure this field to choose a certain 16 KB in the selected trace memory block as trace memory for CPU0. (R/W)

PMS_INTERNAL_SRAM_CORE1_TRACE_ALLOC Configure this field to choose a certain 16 KB in the selected trace memory block as trace memory for CPU1. (R/W)

Register 13.6. PMS_DMA_APBPERI_SPI2_PMS_CONSTRAIN_0_REG (0x0038)

PMS_DMA_APBPERI_SPI2_PMS_CONSTRAIN_LOCK Set this bit to lock SPI2’s GDMA permission configuration register. (R/W)

Register 13.9. PMS_DMA_APBPERI_SPI3_PMS_CONSTRAIN_1_REG (0x0044)

PMS_DMA_APBPERI_SPI3_PMS_CONSTRAIN_SRAM_PMS_0 Configure SPI3's permission to the instruction region. (R/W)

PMS_DMA_APBPERI_SPI3_PMS_CONSTRAIN_SRAM_PMS_1 Configure SPI3's permission to the data region0. (R/W)

PMS_DMA_APBPERI_SPI3_PMS_CONSTRAIN_SRAM_PMS_2 Configure SPI3's permission to the data region1. (R/W)

PMS_DMA_APBPERI_SPI3_PMS_CONSTRAIN_SRAM_PMS_3 Configure SPI3's permission to the data region2. (R/W)

PMS_DMA_APBPERI_SPI3_PMS_CONSTRAIN_SRAM_CACHEDATAARRAY_PMS_0 Configure SPI3's permission to SRAM block9. (R/W)

PMS_DMA_APBPERI_SPI3_PMS_CONSTRAIN_SRAM_CACHEDATAARRAY_PMS_1 Configure SPI3's permission to SRAM block10. (R/W)

Register 13.10. PMS_DMA_APBPERI_UHCI0_PMS_CONSTRAIN_0_REG (0x0048)

PMS_DMA_APBPERI_UHCI0_PMS_CONSTRAIN_LOCK Set this bit to lock UHCI0's GDMA permission configuration register. (R/W)

Register 13.11. PMS_DMA_APBPERI_UHCI0_PMS_CONSTRAN_1_REG (0x004C)

31	12	11	10	9	8	7	6	5	4	3	2	1	0								
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0x3	0x3	0x3	0x3	0x3	0x3	Reset

- PMS_DMA_APBPERI_UHCI0_PMS_CONSTRAN_SRAM_PMS_0** Configure UHCI0's permission to the instruction region. (R/W)
- PMS_DMA_APBPERI_UHCI0_PMS_CONSTRAN_SRAM_PMS_1** Configure UHCI0's permission to data region0 of SRAM. (R/W)
- PMS_DMA_APBPERI_UHCI0_PMS_CONSTRAN_SRAM_PMS_2** Configure UHCI0's permission to data region1 of SRAM. (R/W)
- PMS_DMA_APBPERI_UHCI0_PMS_CONSTRAN_SRAM_PMS_3** Configure UHCI0's permission to data region2 of SRAM. (R/W)
- PMS_DMA_APBPERI_UHCI0_PMS_CONSTRAN_SRAM_CACHEDATAARRAY_PMS_0** Configure UHCI0's permission to SRAM block9. (R/W)
- PMS_DMA_APBPERI_UHCI0_PMS_CONSTRAN_SRAM_CACHEDATAARRAY_PMS_1** Configure UHCI0's permission to SRAM block10. (R/W)

Register 13.12. PMS_DMA_APBPERI_I2S0_PMS_CONSTRAIN_0_REG (0x0050)

31	(reserved)																												1	0
0 0																													0	0

Reset

PMS_DMA_APBPERI_I2S0_PMS_CONSTRAIN_LOCK Set this bit to lock I2S0's GDMA permission configuration register. (R/W)

Register 13.13. PMS_DMA_APBPERI_I2S0_PMS_CONSTRIN_1_REG (0x0054)

PMS_DMA_APBPERI_I2S0_PMS_CONSTRIN_SRAM_PMS_0 Configure I2S0's permission to the instruction region. (R/W)

PMS_DMA_APBPERI_I2S0_PMS_CONSTRIN_SRAM_PMS_1 Configure I2S0's permission to data region0 of SRAM. (R/W)

PMS_DMA_APBPERI_I2S0_PMS_CONSTRIN_SRAM_PMS_2 Configure I2S0's permission to data region1 of SRAM. (R/W)

PMS_DMA_APBPERI_I2S0_PMS_CONSTRIN_SRAM_PMS_3 Configure I2S0's permission to data region2 of SRAM. (R/W)

PMS_DMA_APBPERI_I2S0_PMS_CONSTRIN_SRAM_CACHEDATAARRAY_PMS_0 Configure I2S0's permission to SRAM block9. (R/W)

PMS_DMA_APBPERI_I2S0_PMS_CONSTRIN_SRAM_CACHEDATAARRAY_PMS_1 Configure I2S0's permission to SRAM block10. (R/W)

Register 13.14. PMS_DMA_APBPERI_I2S1_PMS_CONSTRAIN_0_REG (0x0058)

PMS_DMA_APBPERI_I2S1_PMS_CONSTRAIN_LOCK Set this bit to lock I2S1's GDMA permission configuration register.(R/W)

Register 13.15. PMS_DMA_APBPERI_I2S1_PMS_CONSTRIN_1_REG (0x005C)

PMS_CORE_0_DRAM0_PMS_MONITOR_LOCK Set this bit to lock CPU0's DBUS interrupt configuration. (R/W)

Register 13.48. PMS_CORE_0_DRAM0_PMS_MONITOR_1_REG (0x0108)

PMS_CORE_0_DRAM0_PMS_MONITOR_VIOLATE_CLR Set this bit to clear the interrupt triggered when CPU0's dBUS tries to access SRAM or ROM unauthorized. (R/W)

PMS_CORE_0_DRAM0_PMS_MONITOR_VIOLATE_EN Set this bit to enable interrupt when CPU0's dBUS tries to access SRAM or ROM unauthorized. (R/W)

Register 13.49. PMS_CORE_0_PIF_PMS_CONSTRAIN_0_REG (0x0124)

PMS_CORE_0_PIF_PMS_CONSTRAIN_LOCK Set this bit to lock Core0's permission to different peripherals. (R/W)

Register 13.50. PMS_CORE_0_PIF_PMS_CONSTRRAIN_0_REG ($n: 1 - 8$) ($0x0128 + 4*n$)

PMS_CORE_0_PIF_PMS_CONSTRRAIN_WORLD_0_UART1		PMS_CORE_0_PIF_PMS_CONSTRRAIN_WORLD_0_I2S0		(reserved)		PMS_CORE_0_PIF_PMS_CONSTRRAIN_WORLD_0_IO_MUX		PMS_CORE_0_PIF_PMS_CONSTRRAIN_WORLD_0_RTC		PMS_CORE_0_PIF_PMS_CONSTRRAIN_WORLD_0_GPIO		PMS_CORE_0_PIF_PMS_CONSTRRAIN_WORLD_0_G0SPI_0		PMS_CORE_0_PIF_PMS_CONSTRRAIN_WORLD_0_G0SPI_1		PMS_CORE_0_PIF_PMS_CONSTRRAIN_WORLD_0_UART					
31	30	29	28	27		18	17	16	15	14	13		8	7	6	5	4	3	2	1	0
0x3		0x3		0 0 0 0 0 0 0 0 0 0 0 0		0x3		0x3		0 0 0 0 0 0 0 0		0x3		0x3		0x3		0x3		Reset	

PMS_CORE_0_PIF_PMS_CONSTRRAIN_WORLD_0_UART Configures CPU0's permission to access UART0 from the Secure World. (R/W)

PMS_CORE_0_PIF_PMS_CONSTRRAIN_WORLD_0_G0SPI_1 Configures CPU0's permission to access SPI1 from the Secure World. (R/W)

PMS_CORE_0_PIF_PMS_CONSTRRAIN_WORLD_0_G0SPI_0 Configures CPU0's permission to access SPI0 from the Secure World. (R/W)

PMS_CORE_0_PIF_PMS_CONSTRRAIN_WORLD_0_GPIO Configures CPU0's permission to access GPIO from the Secure World. (R/W)

PMS_CORE_0_PIF_PMS_CONSTRRAIN_WORLD_0_RTC Configures CPU0's permission to access eFuse Controller & PMU from the Secure World. (R/W)

PMS_CORE_0_PIF_PMS_CONSTRRAIN_WORLD_0_IO_MUX Configures CPU0's permission to access IO_MUX from the Secure World. (R/W)

PMS_CORE_0_PIF_PMS_CONSTRRAIN_WORLD_0_I2S0 Configures CPU0's permission to access I2S0 from the Secure World. (R/W)

PMS_CORE_0_PIF_PMS_CONSTRRAIN_WORLD_0_UART1 Configures CPU0's permission to access UART1 from the Secure World. (R/W)

Note:

- Registers `PMS_CORE_0_PIF_PMS_CONSTRRAIN_n_REG` (n : 1 - 4) are for configuring the CPU0's permission to different peripherals from the Secure World.
- Registers `PMS_CORE_0_PIF_PMS_CONSTRRAIN_n_REG` (n : 5 - 8) are for configuring the CPU0's permission to different peripherals from the Non-secure World.
- Detailed information are already provided in Table 13-17. For brevity, these registers are not described separately in this section.

Register 13.51. PMS_CORE_0_PIF_PMS_CONSTRRAIN_9_REG (0x0148)

PMS_CORE_0_PIF_PMS_CONSTRRAIN_RTCFAST_SPLTADDR_WORLD_0 Configures the address to split RTC Fast Memory into two regions in Non-secure World for CPU0. Note you should use address offset, instead of absolute address. (R/W)

PMS_CORE_0_PIF_PMS_CONSTRRAIN_RTCFAST_SPLTADDR_WORLD_1 Configures the address to split RTC Fast Memory into two regions in Secure World for CPU0. Note you should use address offset, instead of absolute address. (R/W)

Register 13.53. PMS_CORE_0_PIF_PMS_CONSTRIN_11_REG (0x0150)

(reserved)										PMS_CORE_0_PIF_PMS_CONSTRIN_RTCLOW_0_SPLADDR_WORLD_1										PMS_CORE_0_PIF_PMS_CONSTRIN_RTCLOW_0_SPLADDR_WORLD_0										
31									22	21									11	10									0	
0 0 0 0 0 0 0 0 0 0										0x7f										0x7f										Reset

PMS_CORE_0_PIF_PMS_CONSTRIN_RTCLOW_0_SPLADDR_WORLD_0 Configures the address to split RTC Slow Memory 0 into two regions in Secure World for CPU0. Note you should use address offset, instead of absolute address. (R/W)

PMS_CORE_0_PIF_PMS_CONSTRIN_RTCLOW_0_SPLADDR_WORLD_1 Configures the address to split RTC Slow Memory 0 into two regions in Non-secure World for CPU0. Note you should use address offset, instead of absolute address. (R/W)

Register 13.54. PMS_CORE_0_PIF_PMS_CONSTRAIN_12_REG (0x0154)

- PMS_CORE_0_PIF_PMS_CONSTRAIN_RTCLOW_0_WORLD_0_L** Configures the permission of CPU0 from Secure World to the lower region of RTC Slow Memory 0. (R/W)
- PMS_CORE_0_PIF_PMS_CONSTRAIN_RTCLOW_0_WORLD_0_H** Configures the permission of CPU0 from Secure World to the higher region of RTC Slow Memory 0. (R/W)
- PMS_CORE_0_PIF_PMS_CONSTRAIN_RTCLOW_0_WORLD_1_L** Configures the permission of CPU0 from Non-secure World to the lower region of RTC Slow Memory 0. (R/W)
- PMS_CORE_0_PIF_PMS_CONSTRAIN_RTCLOW_0_WORLD_1_H** Configures the permission of CPU0 from Non-secure World to the higher region of RTC Slow Memory 0. (R/W)

Register 13.55. PMS_CORE_0_PIF_PMS_CONSTRIN_13_REG (0x0158)

(reserved)										PMS_CORE_0_PIF_PMS_CONSTRIN_RTCLOW_1_SPLADDR_WORLD_1										PMS_CORE_0_PIF_PMS_CONSTRIN_RTCLOW_1_SPLADDR_WORLD_0										
31									22	21									11	10									0	
0 0 0 0 0 0 0 0 0 0										0x7f										0x7f										Reset

PMS_CORE_0_PIF_PMS_CONSTRIN_RTCLOW_1_SPLADDR_WORLD_0 Configures the address to split RTC Slow Memory 1 into two regions in Secure World for CPU0. Note you should use address offset, instead of absolute address. (R/W)

PMS_CORE_0_PIF_PMS_CONSTRIN_RTCLOW_1_SPLADDR_WORLD_1 Configures the address to split RTC Slow Memory 1 into two regions in Non-secure World for CPU0. Note you should use address offset, instead of absolute address. (R/W)

Register 13.56. PMS_CORE_0_PIF_PMS_CONSTRAIN_14_REG (0x015C)

PMS_CORE_0_PIF_PMS_CONSTRAIN_RTCSLOW_1_WORLD_0_L Configures the permission of CPU0 from Non-secure World to the lower region of RTC Slow Memory 1. (R/W)

PMS_CORE_0_PIF_PMS_CONSTRAIN_RTCSLOW_1_WORLD_0_H Configures the permission of CPU0 from Non-secure World to the higher region of RTC Slow Memory 1. (R/W)

PMS_CORE_0_PIF_PMS_CONSTRAIN_RTCSLOW_1_WORLD_1_L Configures the permission of CPU0 from Secure World to the lower region of RTC Slow Memory 1. (R/W)

PMS_CORE_0_PIF_PMS_CONSTRAIN_RTCSLOW_1_WORLD_1_H Configures the permission of CPU0 from Secure World to the higher region of RTC Slow Memory 1. (R/W)

Register 13.58. PMS_CORE_0_REGION_PMS_CONSTRRAIN_1_REG (0x0164)

(reserved)																						PMS_CORE_0_REGION_PMS_CONSTRRAIN_WORLD_0_AREA_10																					
PMS_CORE_0_REGION_PMS_CONSTRRAIN_WORLD_0_AREA_9																						PMS_CORE_0_REGION_PMS_CONSTRRAIN_WORLD_0_AREA_8																					
PMS_CORE_0_REGION_PMS_CONSTRRAIN_WORLD_0_AREA_7																						PMS_CORE_0_REGION_PMS_CONSTRRAIN_WORLD_0_AREA_6																					
PMS_CORE_0_REGION_PMS_CONSTRRAIN_WORLD_0_AREA_5																						PMS_CORE_0_REGION_PMS_CONSTRRAIN_WORLD_0_AREA_4																					
PMS_CORE_0_REGION_PMS_CONSTRRAIN_WORLD_0_AREA_3																						PMS_CORE_0_REGION_PMS_CONSTRRAIN_WORLD_0_AREA_2																					
PMS_CORE_0_REGION_PMS_CONSTRRAIN_WORLD_0_AREA_1																						PMS_CORE_0_REGION_PMS_CONSTRRAIN_WORLD_0_AREA_0																					
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

- PMS_CORE_0_REGION_PMS_CONSTRAIN_WORLD_1_AREA_0** Configures CPU0's permission to Peri Region0 from the Non-secure World. (R/W)
- PMS_CORE_0_REGION_PMS_CONSTRAIN_WORLD_1_AREA_1** Configures CPU0's permission to Peri Region1 from the Non-secure World. (R/W)
- PMS_CORE_0_REGION_PMS_CONSTRAIN_WORLD_1_AREA_2** Configures CPU0's permission to Peri Region2 from the Non-secure World. (R/W)
- PMS_CORE_0_REGION_PMS_CONSTRAIN_WORLD_1_AREA_3** Configures CPU0's permission to Peri Region3 from the Non-secure World. (R/W)
- PMS_CORE_0_REGION_PMS_CONSTRAIN_WORLD_1_AREA_4** Configures CPU0's permission to Peri Region4 from the Non-secure World. (R/W)
- PMS_CORE_0_REGION_PMS_CONSTRAIN_WORLD_1_AREA_5** Configures CPU0's permission to Peri Region5 from the Non-secure World. (R/W)
- PMS_CORE_0_REGION_PMS_CONSTRAIN_WORLD_1_AREA_6** Configures CPU0's permission to Peri Region6 from the Non-secure World. (R/W)
- PMS_CORE_0_REGION_PMS_CONSTRAIN_WORLD_1_AREA_7** Configures CPU0's permission to Peri Region7 from the Non-secure World. (R/W)
- PMS_CORE_0_REGION_PMS_CONSTRAIN_WORLD_1_AREA_8** Configures CPU0's permission to Peri Region8 from the Non-secure World. (R/W)
- PMS_CORE_0_REGION_PMS_CONSTRAIN_WORLD_1_AREA_9** Configures CPU0's permission to Peri Region9 from the Non-secure World. (R/W)
- PMS_CORE_0_REGION_PMS_CONSTRAIN_WORLD_1_AREA_10** Configures CPU0's permission to Peri Region10 from the Non-secure World. (R/W)

Register 13.60. PMS_CORE_0_REGION_PMS_CONSTRAIN_n_REG (n: 3 - 14) (0x016C + 4*n)

PMS_CORE_0_REGION_PMS_CONSTRAIN_ADDR_0 Configures the starting address of Region 0 for CPU0. (R/W)

Register 13.61. PMS_CORE_0_PIF_PMS_MONITOR_0_REG (0x019C)

PMS_CORE_0_PIF_PMS_MONITOR_LOCK Set this bit to lock CPU0's PIF interrupt configuration. (R/W)

Register 13.62. PMS_CORE_0_PIF_PMS_MONITOR_1_REG (0x01A0)

PMS_CORE_0_PIF_PMS_MONITOR_VIOLATE_CLR Set this bit to clear the interrupt triggered when CPU0's PIF bus tries to access RTC memory or peripherals unauthorized. (R/W)

PMS_CORE_0_PIF_PMS_MONITOR_VIOLATE_EN Set this bit to enable interrupt when CPU0's PIF bus tries to access RTC memory or peripherals unauthorized. (R/W)

Register 13.63. PMS_CORE_0_PIF_PMS_MONITOR_4_REG (0x01AC)

31	(reserved)																2	1	0	Reset						
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		0	0	0	0	0	1

PMS_CORE_0_PIF_PMS_MONITOR_NONWORD_VIOLATE_EN
 PMS_CORE_0_PIF_PMS_MONITOR_NONWORD_VIOLATE_CLR

PMS_CORE_0_PIF_PMS_MONITOR_NONWORD_VIOLATE_CLR Set this bit to clear the interrupt triggered when CPU0's PIF bus tries to access RTC memory or peripherals using unsupported data type. (R/W)

PMS_CORE_0_PIF_PMS_MONITOR_NONWORD_VIOLATE_EN Set this bit to enable interrupt when CPU0's PIF bus tries to access RTC memory or peripherals using unsupported data type. (R/W)

Register 13.66. PMS_CORE_0_VECBASE_OVERRIDE_1_REG (0x01C0)

PMS_CORE_0_VECBASE_OVERRIDE_WORLD0_VALUE Configures the VECBASE value for the Secure World. (R/W)

PMS_CORE_0_VECBASE_OVERRIDE_SEL Configures VECBASE override. Set to 00 to select VECBASE; Set to 11 to select [PMS_CORE_0_VECBASE_OVERRIDE_WORLD \$n\$ _VALUE](#). (R/W)

Register 13.67. PMS_CORE_0_VECBASE_OVERRIDE_2_REG (0x01C4)

PMS_CORE_0_VECBASE_OVERRIDE_WORLD1_VALUE Configures the VECBASE value for the Non-secure World. (R/W)

Register 13.68. PMS_EDMA_BOUNDARY_LOCK_REG (0x02A8)

PMS_EDMA_BOUNDARY_LOCK Set this bit to lock EDMA boundary registers. (R/W)

Register 13.69. PMS_EDMA_BOUNDARY_0_REG (0x02AC)

PMS_EDMA_BOUNDARY_0 Configures the ending address of external SRAM area0. For details, see Table 13-21. (R/W)

Register 13.70. PMS_EDMA_BOUNDARY_1_REG (0x02B0)

PMS_EDMA_BOUNDARY_1 Configures the ending address of external SRAM area1. For details, see Table 13-21. (R/W)

Register 13.71. PMS_EDMA_BOUNDARY_2_REG (0x02B4)

PMS_EDMA_BOUNDARY_2 Configures the ending address of external SRAM area2. For details, see Table 13-21. (R/W)

Register 13.72. PMS_EDMA_PMS_SPI2_LOCK_REG (0x02B8)

PMS_EDMA_PMS_SPI2_LOCK Set this bit to lock the register that configures SPI2's access to external SRAM. (R/W)

Register 13.75. PMS_EDMA_PMS_SPI3_REG (0x02C4)

PMS_EDMA_PMS_SPI3_ATTR1 Configures SPI3's access to external SRAM Area0. For details, see Table 13-22. (R/W)

PMS_EDMA_PMS_SPI3_ATTR2 Configures SPI3's access to external SRAM Area1. For details, see Table 13-22. (R/W)

Register 13.76. PMS_EDMA_PMS_UHCI0_LOCK_REG (0x02C8)

PMS_EDMA_PMS_UHCI0_LOCK Set this bit to lock the register that configures UHCI0's access to external SRAM. (R/W)

Register 13.77. PMS_EDMA_PMS_UHCI0_REG (0x02CC)

PMS_EDMA_PMS_UHCI0_ATTR1 Configures UHCI0's access to external SRAM Area0. For details, see Table 13-22. (R/W)

PMS_EDMA_PMS_UHCI0_ATTR2 Configures UHCI0's access to external SRAM Area1. For details, see Table 13-22. (R/W)

Register 13.78. PMS_EDMA_PMS_I2S0_LOCK_REG (0x02D0)

PMS_EDMA_PMS_I2S0_LOCK Set this bit to lock the register that configures I2S0's access to external SRAM. (R/W)

Register 13.79. PMS_EDMA_PMS_I2S0_REG (0x02D4)

PMS_EDMA_PMS_I2S0_ATTR1 Configures I2S0's access to external SRAM Area0. For details, see Table 13-22. (R/W)

PMS_EDMA_PMS_I2S0_ATTR2 Configures I2S0's access to external SRAM Area1. For details, see Table 13-22. (R/W)

Register 13.80. PMS_EDMA_PMS_I2S1_LOCK_REG (0x02D8)

PMS_EDMA_PMS_I2S1_LOCK Set this bit to lock the register that configures I2S1's access to external SRAM. (R/W)

Register 13.83. PMS_EDMA_PMS_LCD_CAM_REG (0x02E4)

PMS_EDMA_PMS_LCD_CAM_ATTR1 Configures Camera-LCD Controller’s access to external SRAM Area0. For details, see Table 13-22. (R/W)

PMS_EDMA_PMS_LCD_CAM_ATTR2 Configures Camera-LCD Controller’s access to external SRAM Area1. For details, see Table 13-22. (R/W)

Register 13.84. PMS_EDMA_PMS_AES_LOCK_REG (0x02E8)

PMS_EDMA_PMS_AES_LOCK Set this bit to lock the register that configures AES’s access to external SRAM. (R/W)

Register 13.85. PMS_EDMA_PMS_AES_REG (0x02EC)

PMS_EDMA_PMS_AES_ATTR1 Configures AES's access to external SRAM Area0. For details, see Table 13-22. (R/W)

PMS_EDMA_PMS_AES_ATTR2 Configures AES's access to external SRAM Area1. For details, see Table 13-22. (R/W)

Register 13.86. PMS_EDMA_PMS_SHA_LOCK_REG (0x02F0)

PMS_EDMA_PMS_SHA_LOCK Set this bit to lock the register that configures SHA's access to external SRAM. (R/W)

Register 13.91. PMS_EDMA_PMS_RMT_REG (0x0304)

PMS_EDMA_PMS_RMT_ATTR1 Configures Remote Control Peripheral’s access to external SRAM Area0. For details, see Table 13-22. (R/W)

PMS_EDMA_PMS_RMT_ATTR2 Configures Remote Control Peripheral’s access to external SRAM Area1. For details, see Table 13-22. (R/W)

Register 13.92. PMS_CLOCK_GATE_REG_REG (0x0308)

PMS_REG_CLK_EN Set this bit to enable the clock gating function. (R/W)

Register 13.93. PMS_CORE_0_IRAM0_PMS_MONITOR_2_REG (0x00EC)

(reserved)			PMS_CORE_0_IRAM0_PMS_MONITOR_VIOLATE_STATUS_ADDR					PMS_CORE_0_IRAM0_PMS_MONITOR_VIOLATE_STATUS_WORLD					PMS_CORE_0_IRAM0_PMS_MONITOR_VIOLATE_STATUS_LOADSTORE					PMS_CORE_0_IRAM0_PMS_MONITOR_VIOLATE_STATUS_INTR								
31	29	28						5	4	3	2	1	0						Reset							
0	0	0						0					0	0	0	0										

PMS_CORE_0_IRAM0_PMS_MONITOR_VIOLATE_INTR Stores the interrupt status of CPU0's unauthorized IBUS access. (RO)

PMS_CORE_0_IRAM0_PMS_MONITOR_VIOLATE_STATUS_WR Indicates the access direction. 1: write; 0: read. Note that this field is only valid when [PMS_CORE_0_IRAM0_PMS_MONITOR_VIOLATE_STATUS_LOADSTORE](#) is 1. (RO)

PMS_CORE_0_IRAM0_PMS_MONITOR_VIOLATE_STATUS_LOADSTORE Indicates the instruction direction. 1: load/store; 0: instruction execution. (RO)

PMS_CORE_0_IRAM0_PMS_MONITOR_VIOLATE_STATUS_WORLD Stores the world the CPU0 was in when the illegal access happened. 0b01: Secure World; 0b10: Non-secure World. (RO)

PMS_CORE_0_IRAM0_PMS_MONITOR_VIOLATE_STATUS_ADDR Stores the address that CPU0's IBUS was trying to access unauthorized. Note that this is an offset to 0x40000000 and the unit is 4, which means the actual address should be $0x40000000 + \text{PMS_CORE_0_IRAM0_PMS_MONITOR_VIOLATE_STATUS_ADDR} * 4$. (RO)

Register 13.94. PMS_CORE_0_DRAM0_PMS_MONITOR_2_REG (0x010C)

(reserved)						PMS_CORE_0_DRAM0_PMS_MONITOR_VIOLATE_STATUS_ADDR				PMS_CORE_0_DRAM0_PMS_MONITOR_VIOLATE_STATUS_WORLD				PMS_CORE_0_DRAM0_PMS_MONITOR_VIOLATE_STATUS_LOCK				PMS_CORE_0_DRAM0_PMS_MONITOR_VIOLATE_INTR						
31						26	25					4	3	2	1	0								
0	0	0	0	0	0	0					0	0	0	0	Reset									

PMS_CORE_0_DRAM0_PMS_MONITOR_VIOLATE_INTR Stores the interrupt status of dBUS unauthorized access. (RO)

PMS_CORE_0_DRAM0_PMS_MONITOR_VIOLATE_STATUS_LOCK Flags atomic access. 1: atomic access; 0: not atomic access. (RO)

PMS_CORE_0_DRAM0_PMS_MONITOR_VIOLATE_STATUS_WORLD Stores the world the CPU was in when the unauthorized access happened. 0b01: Secure World; 0b10: Non-secure World. (RO)

PMS_CORE_0_DRAM0_PMS_MONITOR_VIOLATE_STATUS_ADDR Stores the address that CPU0's dBUS was trying to access unauthorized. Note that this is an offset to 0x3c000000 and the unit is 16, which means the actual address should be 0x3c000000 + [PMS_CORE_0_DRAM0_PMS_MONITOR_VIOLATE_STATUS_ADDR](#) * 16. (RO)

Register 13.95. PMS_CORE_0_DRAM0_PMS_MONITOR_3_REG (0x0110)

PMS_CORE_0_DRAM0_PMS_MONITOR_VIOLATE_STATUS_WR Stores the direction of unauthorized access. 0: read; 1: write. (RO)

PMS_CORE_0_DRAM0_PMS_MONITOR_VIOLATE_STATUS_BYTEEN Stores the byte information of illegal access. (RO)

Register 13.97. PMS_CORE_0_PIF_PMS_MONITOR_3_REG (0x01A8)

PMS_CORE_0_PIF_PMS_MONITOR_VIOLATE_STATUS_HADDR Stores the address that CPU0's PIF bus was trying to access unauthorized. (RO)

Register 13.99. PMS_CORE_0_PIF_PMS_MONITOR_6_REG (0x01B4)

PMS_CORE_0_PIF_PMS_MONITOR_NONWORD_VIOLATE_STATUS_HADDR Stores the address that CPU0's PIF bus was trying to access using unsupported data type. (RO)

Register 13.100. PMS_DATE_REG (0x0FFC)

PMS_DATE Sensitive Date register. (R/W)

Register 13.103. APB_CTRL_FLASH_ACE n _ADDR_REG (n : 0-3) (0x0038 + 4* n)

APB_CTRL_FLASH_ACE0_ADDR_S Configure the starting address of Flash Region n . The size of each region should be aligned to 64 KB. (R/W)

Register 13.104. APB_CTRL_FLASH_ACE n _SIZE_REG (n : 0-3) (0x0048 + 4* n)

APB_CTRL_FLASH_ACE n _SIZE Configure the length of Flash Region n . The size of each region should be aligned to 64 KB. (R/W)

Register 13.105. APB_CTRL_SRAM_ACE_{*n*}_ATTR_REG (0x0058)

APB_CTRL_SRAM_ACE_{*n*}_ATTR Configures the permission to Region *n* of SRAM. (R/W)

Register 13.106. APB_CTRL_SRAM_ACE_{*n*}_ADDR_REG (*n*: 0-3) (0x0068 + 4**n*)

APB_CTRL_SRAM_ACE_{*n*}_ADDR_S Configure the starting address of SRAM Region *n*. The size of each region should be aligned to 64 KB. (R/W)

Register 13.107. APB_CTRL_SRAM_ACE n _SIZE_REG (n : 0-3) (0x0078 + 4* n)

APB_CTRL_SRAM_ACE n _SIZE Configure the length of SRAM Region n . The size of each region should be aligned to 64 KB. (R/W)

Register 13.108. APB_CTRL_SPI_MEM_PMS_CTRL_REG (0x0088)

APB_CTRL_SPI_MEM_REJECT_INT Indicates exception accessing external memory and triggers an interrupt. (RO)

APB_CTRL_SPI_MEM_REJECT_CLR Set this bit to clear the exception status. (WOD)

APB_CTRL_SPI_MEM_REJECT_CDE Stores the exception cause: invalid region, overlapping regions, illegal write, illegal read and illegal instruction execution. (RO)

Register 13.109. APB_CTRL_SPI_MEM_REJECT_ADDR_REG (0x008C)

APB_CTRL_SPI_MEM_REJECT_ADDR Store the exception address.(RO)

14 World Controller

14.1 Introduction

ESP32-S3 allows users to allocate its hardware and software resource into Secure World (World0) and Non-secure World (World1), thus protecting resource from unauthorized access (read or write), and from malicious attacks such as malware, hardware-based monitoring, hardware-level intervention, and so on. CPUs can switch between Secure World and Non-secure World with the help of the World Controller.

By default, all resource in ESP32-S3 are shareable. Users can allocate the resource into two worlds by managing respective permission (For details, please refer to Chapter [13 Permission Control \(PMS\)](#)). This chapter only introduces the World Controller and how CPUs can switch between worlds with the help of World Controller.

14.2 Features

ESP32-S3's World Controller:

- Controls the CPUs to switch between the Secure World and Non-secure World
- Logs CPU's world switches
- Allows NMI masking
- Allows independent world switches of CPUs (CORE_m: CPU0 and CPU1)

14.3 Functional Description

With the help of World Controller, we can allocate different resources to the Secure World and the Non-secure World:

- Secure World (World0):
 - Can access all peripherals and memories;
 - Performs all confidential operations, such as fingerprint identification, password processing, data encryption and decryption, security authentication, etc.
- Non-secure World (World1):
 - Can access some peripherals and memories;
 - Performs other operations, such as user operation and different applications, etc.

ESP32-S3's CPU and slave devices are both configurable with permission to either Secure World and/or Non-Secure World:

- CPU can be in either world at a particular time:
 - In Secure World: performs confidential operations;
 - In Non-secure World: performs non-confidential operations;
 - By default, CPU runs in Secure World after power-up, then can be programmed to switch between two worlds.

- All slave devices (including peripherals* and memories) can be configured to be accessible from the Secure World and/or the Non-secure World:
 - Secure World Access: this slave can be called from Secure World only, meaning it can be accessed only when CPU is in Secure World;
 - Non-secure World Access: this slave can be called from Non-secure World only, meaning it can be accessed only when CPU is in Non-secure World.
 - Note that a slave can be configured to be accessible from both Secure World and Non-secure World simultaneously.

For details, please refer to Chapter 13 *Permission Control (PMS)*.

Note:

* World Controller itself is a peripheral, meaning it also can be granted with Secure World access and/or Non-secure World access, just like all other peripherals. However, to secure the world switch mechanism, World Controller should not be accessible from Non-secure world. Therefore, world controller **should not be granted with** Non-secure World access, preventing any modification to world controller from the Non-secure World.

When CPU accesses any slaves:

1. First, CPU notifies the slave about its own world information;
2. Second, slave decides if it can be accessed by CPU based on the CPU's world information and its own world permission configuration.
 - if allowed, then this slave responds to CPU;
 - if not allowed, then this slave will not respond to CPU and trigger an interrupt.

In this way, the resources in the Secure World will not be illegally accessible by the Non-secure World in an unauthorized way.

14.4 CPU's World Switch

CPU can switch from Secure World to Non-secure World, and from Non-secure World to Secure World.

14.4.1 From Secure World to Non-secure World

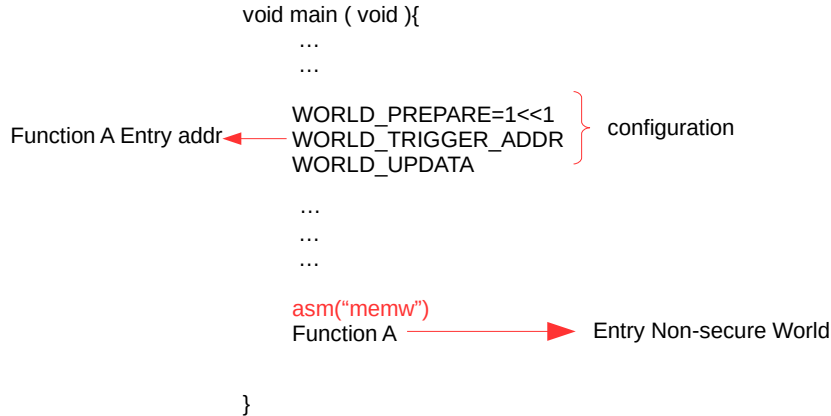

Figure 14-1. Switching From Secure World to Non-secure World

ESP32-S3's CPU only needs to complete the following steps to switch from Secure World to Non-secure World:

1. Configure the World Controller, as described below.
2. Clear the data stored in `write_buffer`, as described in Section 14.4.3.

After that, CPU can switch to the Non-secure World.

However, it's worth noting that you cannot call the application in Non-secure world immediately after configuring the World Controller. For reasons such as CPU pre-indexed addressing and pipeline, it is possible that the CPU have already executed the application in Non-secure World before the World Controller configuration is effective, meaning the CPU runs unsecured application in the Secure World.

Therefore, you need to make sure the CPU only calls applications in the Non-secure world after the World Controller configuration takes effect. This can be guaranteed by **declaring the applications in the Non-secure World as "noinline"**.

Configuring the World Controller

The steps to configure the World Controller to switch the CPU from the Secure World to the Non-secure World are described below:

1. Write 0x2 to Register `WCL_CORE_m_WORLD_PERPARE_REG`, indicating the CPU needs to switch to the Non-secure World.
2. Configure Register `WCL_CORE_m_World_TRIGGER_ADDR_REG` as the entry address to the Non-secure World, i.e., the address of the application in the Non-secure World that needs to be executed.
3. Write any value to Register `WCL_CORE_m_World_UPDATE_REG`, indicating the configuration is done.

Note:

- Register `WCL_CORE_m_World_UPDATE_REG` must be configured at last.
- Registers `WCL_CORE_m_WORLD_PERPARE_REG` and `WCL_CORE_m_World_TRIGGER_ADDR_REG` can be configured in any order.
- After the configuration, you also need to use assembly instruction `memw` (memory wait) to clear `write_buffer`. For details, see Section 14.4.3.

Afterwards, the World Controller keeps monitoring if CPU is executing the configured address of the application in Non-secure World. CPU switches to the Non-secure World once it executes the configured address, and executes the applications in the Non-secure World.

After configuration, the World Controller:

- Keeps monitoring until the CPU executes the configured address and switches to the Non-secure World.
 - Write any value to Register `WCL_CORE_m_World_Cancel_REG` to cancel the World Controller configuration. After the cancellation, CPU will not switch to the Non-secure World even it executes to the configured address. Note that you also need to use assembly instruction `memw` (memory wait) to clear `write_buffer`. For details, see Section 14.4.3.
- The World Controller can only switch from the Secure World to Non-secure World once per configuration. Therefore, the World Controller needs to be configured again after each world switch to prepare it for the next world switch.

14.4.2 From Non-secure World to Secure World

```

void main ( void ){
    ...
    ...
    ...
    Function B entry addr ← ENTRY_ADDR ( X )
                          ENTRY_CHECK=1<<X } configuration
    ...
    ...
    ...
    Function B → Entry Secure World
}

```

Figure 14-2. Switching From Non-secure World to Secure World

CPU can only switch from Non-secure World to Secure World via **Interrupts (or Exceptions)**. After configuring the World Controller, the CPU can switch back Non-secure World to Secure World upon the configured Interrupt trigger.

See details below:

1. Configure Registers [WCL_CORE_m_MESSAGE_ADDR_REG](#) and [WCL_CORE_m_MESSAGE_MAX_REG](#) to clear `write_buffer`, as described in Section 14.4.3.
2. Configure Registers [WCL_CORE_m_ENTRY_n_ADDR_REG](#) (n : 1-13) as the entry address of interrupts (or exceptions).
 - Note that all of ESP32-S3's interrupts and exceptions are using `VecBase + offset` as its address. Therefore, you need to configure [WCL_CORE_m_ENTRY_n_ADDR_REG](#) (n : 1-13) whenever you modify the `VecBase`.
3. Configure Register [WCL_CORE_m_ENTRY_CHECK_REG](#) to enable the monitor of a certain entry. In this way, the CPU switches to the Secure World immediately when it executes the address monitored at this particular entry.
 - Bit x controls the entry monitoring of Entry x ([WCL_CORE_m_ENTRY_x_ADDR_REG](#)). You can enable monitoring for more than one entry.
 - 0: Disable monitoring
 - 1: Enable monitoring
 - Register [WCL_CORE_m_ENTRY_CHECK_REG](#) is effective after configuration all the time till it's disabled, meaning you don't need to configure this register every time after each world switch.

14.4.3 Clearing the `write_buffer`

ESP32-S3 has implemented [write_buffer](#), which means the CPU buses can still hold some data from or execute instructions from the other world after world switches. To improve data security, we need to clear the `write_buffer` before world switching:

- **Switching from Secure World to Non-secure World**
 - Use assembly instruction `memw` (memory wait).
- **Switching from Non-secure World to Secure World**
 - Switch CPU data bus:
 1. Pre-configure the following registers:
 - * Configures Register [WCL_CORE_m_MESSAGE_ADDR_REG](#) to an address in the Non-secure World;
 - * Configure Register [WCL_CORE_m_MESSAGE_MAX_REG](#) to Z ($Z \in \{3, 4, \dots, 16\}$)
 2. Write sequences of 0, 1, ..., $Z-1$, Z to the address configured in Register [WCL_CORE_m_MESSAGE_ADDR_REG](#) before world switching. For example, if Z is configured to 3, then you need to write sequences of 0, 1, 2, 3 into the configured address; if Z is 5, then write 0, 1, 2, 3, 4, 5.
 3. Afterwards, the CPU will switch its data bus to the other world once it detects the agreed sequences configured in [WCL_CORE_m_MESSAGE_MAX_REG](#) are being written to the agreed address configured in [WCL_CORE_m_MESSAGE_ADDR_REG](#).

14.5 World Switch Log

In actual use cases, CPU is switching between two worlds quite frequently and has to deal with nested interrupts. To be able to restore to the previous world, World Controller keeps a world switching log in a series of registers, which is called “World Switch Log Table”.

14.5.1 Structure of World Switch Log Register

ESP32-S3's World Switch Log Table consists of 13 `WCL_CORE_m_STATUSTABLEn_REG(n: 1-13)` registers (see Figure 14-3). The world switching of address configured in `WCL_CORE_m_ENTRY_x_ADDR_REG`, which is monitored at Entry x , is logged in `WCL_CORE_m_STATUSTABLEx_REG`.

Figure 14-3. World Switch Log Register

- `WCL_CORE_m_FROM_WORLD_n`: logs the world information before the world switch.
 - 0: CPU was in Secure World
 - 1: CPU was in Non-secure World
- `WCL_CORE_m_FROM_ENTRY_n`: logs the entry information before the world switch.
 - 0: CPU was not at any interrupts monitored at any entry.
 - 1 - 13: CPU was at the interrupt monitored at a certain entry.
- `WCL_CORE_m_CURRENT_n`: indicates if CPU is at the interrupt monitored at the current entry. When CPU is at the interrupt monitored at Entry x ,
 - `WCL_CORE_m_CURRENT_x` is updated to 1,
 - and the same fields of all other entries are updated to 0.

14.5.2 How World Switch Log Registers are Updated

To explain this process, assuming:

1. At the beginning:
 - CPU is running in the Non-secure World;
 - Registers `WCL_CORE_m_STATUSTABLEn_REG(n: 1-13)` are all empty.
2. Then an interrupt occurs at Entry 9;
3. Then another interrupt with higher priority occurs at Entry 1;
4. Then the last interrupt with highest priority occurs at Entry 4.

The World Switch Log Table is updated as described below:

1. First, an interrupt occurs at Entry 9. At this time, CPU executes to the entry address of this interrupt. The World Switch Log Table is updated as described in Figure 14-4:

entry	current	from_entry	from_world
1	0	0	0
2	0	0	0
3	0	0	0
4	0	0	0
5	0	0	0
6	0	0	0
7	0	0	0
8	0	0	0
9	1	0	1
10	0	0	0
11	0	0	0
12	0	0	0
13	0	0	0

Figure 14-4. Nested Interrupts Handling - Entry 9

- `WCL_CORE_m_STATUSTABLE9_REG`
 - Field `WCL_CORE_m_FROM_WORLD_9` is updated to 1, indicating CPU was in Non-secure World before the interrupt.
 - Field `WCL_CORE_m_FROM_ENTRY_9` is updated to 0, indicating there was not any interrupt before this one.
 - Field `WCL_CORE_m_CURRENT_9` is updated to 1, indicating the CPU is currently at the interrupt monitored at Entry 9.
- Other `WCL_CORE_m_STATUSTABLEn_REG` registers are not updated.

2. Then another interrupt with higher priority occurs at Entry 1. At this time, CPU executes to the entry address of this interrupt. The World Switch Log Table is updated again as described in Figure 14-5:

entry	current	from_entry	from_world
1	1	9	0
2	0	0	0
3	0	0	0
4	0	0	0
5	0	0	0
6	0	0	0
7	0	0	0
8	0	0	0
9	0	0	1
10	0	0	0
11	0	0	0
12	0	0	0
13	0	0	0

Figure 14-5. Nested Interrupts Handling - Entry 1

- `WCL_CORE_m_STATUSTABLE1_REG`
 - Field `WCL_CORE_m_FROM_WORLD_1` is updated to 0, indicating the CPU was in Secure World before this interrupt.
 - Field `WCL_CORE_m_FROM_ENTRY_1` is updated to 9, indicating the CPU was executing the interrupt at Entry 9.
 - Field `WCL_CORE_m_CURRENT_1` is updated to 1, indicating CPU is currently at the interrupt monitored at Entry 1.

- `WCL_CORE_m_STATUSTABLE9_REG`
 - Field `WCL_CORE_m_CURRENT_9` is updated to 0, indicating CPU is no longer at the interrupt monitored at Entry 9 (Instead, CPU is at the interrupt monitored at Entry 1 already).
 - Fields `WCL_CORE_m_FROM_WORLD_9` and `WCL_CORE_m_FROM_ENTRY_9` stay the same.
 - Other `WCL_CORE_m_STATUSTABLEn_REG` registers are not updated.
3. Then the last interrupt with highest priority occurs at Entry 4. At this time, CPU executes to the entry address of interrupt 4. The World Switch Log Table is updated again as described in Figure 14-6:

	current	from_entry	from_world
1	0	9	0
2	0	0	0
3	0	0	0
4	1	1	0
5	0	0	0
6	0	0	0
7	0	0	0
8	0	0	0
9	0	0	1
10	0	0	0
11	0	0	0
12	0	0	0
13	0	0	0

Figure 14-6. Nested Interrupts Handling - Entry 4

- `WCL_CORE_m_STATUSTABLE4_REG`
 - Field `WCL_CORE_m_FROM_WORLD_4` is updated to 0, indicating the CPU was in Secure World before this interrupt.
 - Field `WCL_CORE_m_FROM_ENTRY_4` is updated to 1, indicating the CPU was the interrupt at Entry 1.
 - Field `WCL_CORE_m_CURRENT_4` is updated to 1, indicating the CPU is currently at the interrupt monitored an Entry 4.
- `WCL_CORE_m_STATUSTABLE1_REG`
 - Field `WCL_CORE_m_CURRENT_1` is updated to 0, indicating the CPU is no longer at the interrupt monitored at Entry 1 (Instead CPU is at the interrupt monitored at Entry 4 already).
 - Fields `WCL_CORE_m_FROM_WORLD_1` and `WCL_CORE_m_FROM_ENTRY_1` are not updated.
- Other `WCL_CORE_m_STATUSTABLEn_REG` registers are not updated.

14.5.3 How to Read World Switch Log Registers

By reading World Switch Log Registers, we get to understand the information of previous world switches and nested interrupts, thus being able to restore to previous world.

Steps are described below: (See Figure 14-6 as an example):

1. Read Register `WCL_CORE_m_STATUSTABLE_CURRENT_REG`, and understand CPU is now at the interrupt monitored at Entry 4.
2. Read 1 from Field `WCL_CORE_m_FROM_ENTRY_4`, and understand the CPU was at an interrupt monitored at Entry 1.

3. Read 9 from Field `WCL_CORE_m_FROM_ENTRY_1`, and understand the CPU was at an interrupt monitored at Entry 9.
4. Read 0 from `WCL_CORE_m_FROM_ENTRY_9`, and understand CPU wasn't at any interrupt. Then read 1 from `WCL_CORE_m_FROM_WORLD_9`, and understand CPU was in Non-secure World at the beginning.

14.5.4 Nested Interrupts

ESP32-S3 supports nested interrupts, for example:

1. An interrupt A occurs. CPU jumps to interrupt A entry, which triggers world switches.
2. When CPU is handling interrupt A, an interrupt B with higher priority occurs.
3. Then the CPU drops the current interrupt A and switches to the higher priority interrupt B first.
4. After returning from interrupt B, CPU resumes executing the instruction at interrupt A entry, which triggers world switches again.

In this way, CPU executes the entry address of the first interrupt twice (one time when the interrupt occurs and another time when CPU returns to this interrupt), and thus triggering the world switches twice, which inevitably leads to multiple records tracked for the same interrupt in [World Switch Log](#) and prevents the CPU from restoring to the previous world correctly.

14.5.4.1 How to Handle Nested Interrupts

To avoid multiple records being logged incorrectly in the [World Switch Log](#), the following actions must be completed:

- During the design stage, add two assembly instruction NOP.N (No Operation) to the vector entrance of all interrupts and exceptions.
- During the execution, update the address where the interrupts return to following the instructions described in [14.5.4.2](#).

In this way, when returning to the interrupt at Entry *B*, the interrupt monitored at Entry *A* will not return to the entry address of Entry *B*, but the address after the NOP instructions, thus preventing to trigger the world controller unexpectedly. Also, the NOP instruction doesn't do anything, so nothing is changed even when the NOP instructions are skipped.

14.5.4.2 Programming Procedure

Handling the interrupt at Entry *A*:

1. Clear the write_buffer by writing the agreed sequences configured in Register `WCL_CORE_m_MESSAGE_MAX_REG` to the address configured in `WCL_CORE_m_MESSAGE_ADDR_REG`. For details, see [Section 14.4.3](#).
2. Execute the interrupt programs.
3. Disable all interrupts.
4. Update the address where the interrupt at Entry *A* returns to:
 - Read Field `WCL_CORE_m_FROM_ENTRY_A` for Entry *A*:

- 0: indicates all interrupts are handled, and returns to a normal program:
 - (a) Update Field `WCL_CORE_m_CURRENT_A` of Entry *A* to 0, indicating the CPU is no longer at the interrupt monitored at Entry *A*.
 - (b) Go to Step 5.
 - 1 - 13: indicates the CPU returns to another interrupt monitored at Entry *B*,
 - (a) First, check the return address of the interrupt at Entry *A*:
 - * If it points to the first NOP.N instruction of the interrupt at Entry *B*, then add 4 to the return address of the interrupt at Entry *A*.
 - * If it points to the second NOP.N instruction of the interrupt at Entry *B*, then add 2 to the return address of the interrupt at Entry *A*.
 - * If it points to other address, then no need to update the return address.
 - (b) Update the [How to Read World Switch Log Registers](#):
 - * Update the world switch register of Entry *A*:
 - Update Field `WCL_CORE_m_CURRENT_A` to 0, indicating the CPU is no longer at the interrupt monitored at Entry *A*.
 - Fields `WCL_CORE_m_FROM_WORLD_A` and `WCL_CORE_m_FROM_ENTRY_A` stay the same.
 - * Update the world switch register of Entry *B*:
 - Update Field `WCL_CORE_m_CURRENT_B` to 1, indicating the CPU will return to Entry *B*.
5. Prepare to exit interrupt.
- (a) Check if CPU needs to switch to the other world:
 - If world switch not required, then go to Step 6.
 - If world switch required, then switch the CPU to the other world following instructions described in Section 14.4, then go to Step 6.
6. Enable interrupts, and exit.

Note:

Steps 4 and 5 should not be interrupted by any interrupts. Therefore, users need to disable all the interrupts before these steps, and enable interrupts once done.

14.6 NMI Interrupt Masking

Some software process of ESP32-S3 should not be interrupted. For example, the configuration of World Controller should not be interrupted by any interrupts, including the NMI interrupts.

Normally, we can configure some CPU registers to mask different kinds of interrupts, but NMI interrupt is not one of them. To mask an NMI interrupt, you need to configure the interrupt sources, which is more complicated. For details, see Chapter 8 [Interrupt Matrix \(INTERRUPT\)](#).

World Controller has implemented some hardware mechanism to simplify the process to mask NMI interrupts for:

- **All** applications:
 - Configure `WCL_CORE_m_NMI_MASK`:
 - * 1: Enable
 - * 0: Disable
- **Some** applications:
 1. Configures `WCL_CORE_m_NMI_MASK_TRIGGER_ADDR` to the address at which the NMI interrupt masking ends, meaning the CPU stops masking NMI interrupts after this address.
 2. Write any value to `WCL_CORE_m_NMI_MASK_DISABLE`, indicating the completion of `WCL_CORE_m_NMI_MASK_TRIGGER_ADDR` configuration.
 3. Write any value to `WCL_CORE_m_NMI_MASK_ENABLE` to start masking NMI interrupts till the address configured in `WCL_CORE_m_NMI_MASK_TRIGGER_ADDR`.

Note:

- Only one of the above two methods should be used at the same time.
- The configuration to mask NMI interrupts is effective all the time until trigger address executes. Therefore, you need to configure the world controller to mask NMI interrupts again once trigger address executes.

14.7 Register Summary

The addresses in this section are relative to the World Controller base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Note that, the table below only lists the registers for CPU0. CPU1 shares exactly the same set of registers. Adding 0x0400 to the offset of the equivalent of CPU0 register gives you address for CPU1 registers.

For example, the offset for CPU0 register `WCL_CORE_0_ENTRY_CHECK_REG` is 0x007C, the offset for CPU1 equivalent `WCL_CORE_1_ENTRY_CHECK_REG` should be 0x007C + 0x0400, which is 0x047C.

Name	Description	Address	Access
Non-secure World to Secure World Configuration Registers			
<code>WCL_CORE_0_ENTRY_n_ADDR_REG (n: 1-13)</code>	CPU0 Entry <i>n</i> Address Configuration Register	0x0000	R/W
<code>WCL_CORE_0_ENTRY_CHECK_REG</code>	CPU0 Entry Check Enable Register	0x007C	R/W
<code>WCL_CORE_0_MESSAGE_ADDR_REG</code>	CPU0 Clear Writer_buffer Configuration Register - Configures Address	0x0100	R/W
<code>WCL_CORE_0_MESSAGE_MAX_REG</code>	CPU0 Clear Writer_buffer Configuration Register - Configures sequence	0x0104	R/W
<code>WCL_CORE_0_MESSAGE_PHASE_REG</code>	CPU0 Clear Writer_buffer Configuration Register - Checks Status	0x0108	RO
Status Table Registers			
<code>WCL_CORE_0_STATUSTABLEn_REG(n: 1-13)</code>	CPU0 World Switch Status Register for Entry <i>n</i>	0x0080	R/W
<code>WCL_CORE_0_STATUSTABLE_CURRENT_REG</code>	CPU0 Status Register of Statustable Current Field	0x00FC	R/W
Secure World to Non-secure World Configuration Registers			
<code>WCL_CORE_0_World_TRIGGER_ADDR_REG</code>	CPU0 Trigger Address Configuration Register	0x0140	RW
<code>WCL_CORE_0_World_PREPARE_REG</code>	CPU0 World Configuration Register - Configures Entry Address	0x0144	R/W

<code>WCL_CORE_0_NMI_MASK_PHASE_REG</code>	CPU0 NMI Mask Status Register	0x0194	RO

Register 14.3. WCL_CORE_0_MESSAGE_ADDR_REG (0x0100)

WCL_CORE_0_MESSAGE_ADDR Configures the address to write agreed sequence to clear write_buffer for CPU0. (R/W)

Register 14.4. WCL_CORE_0_MESSAGE_MAX_REG (0x0104)

WCL_CORE_0_MESSAGE_MAX Configures the agreed sequence to write to clear write_buffer for CPU0. It's advised to set this field to no less than 3. (R/W)

Register 14.5. WCL_CORE_0_MESSAGE_PHASE_REG (0x0108)

WCL_CORE_0_MESSAGE_MATCH Indicates if CPU0's world switch is successful. This field is only used for debugging. (RO)

WCL_CORE_0_MESSAGE_EXPECT Indicates the number to be written next for CPU0. This field is only used for debugging. (RO)

WCL_CORE_0_MESSAGE_DATAPHASE When 1, indicates CPU0 is checking if the agreed sequence is written to clear write_buffer. This field is only used for debugging. (RO)

WCL_CORE_0_MESSAGE_ADDRESSPHASE When 1, indicates CPU0 is checking if any sequence is written to the agreed address to clear write_buffer. This field is only used for debugging. (RO)

Register 14.6. WCL_CORE_0_STATUSTABLE_n_REG (n: 1-13) (0x0080+4*n)

WCL_CORE_0_FROM_WORLD_n Stores the world info for CPU0 before entering entry *n*. (R/W)

WCL_CORE_0_FROM_ENTRY_n Stores the previous entry info for CPU0 before entering entry *n*. (R/W)

WCL_CORE_0_CURRENT_n Indicates if the interrupt is at entry *n* for CPU0. (R/W)

Register 14.7. WCL_CORE_0_STATUSTABLE_CURRENT_REG (0x00FC)

WCL_CORE_0_STATUSTABLE_CURRENT Indicates the entry where the interrupt is currently at for CPU0. (R/W)

Register 14.8. WCL_CORE_0_World_TRIGGER_ADDR_REG (0x0140)

WCL_CORE_0_WORLD_TRIGGER_ADDR Configures the entry address at which CPU0 switches from Secure World to Non-secure World. (RW)

Register 14.9. WCL_CORE_0_World_PREPARE_REG (0x0144)

WCL_CORE_0_WORLD_PREPARE Write 0x2 to this field to ready CPU0 for world switch from Secure World to Non-secure World. This field is only used for debugging.(R/W)

Register 14.13. WCL_CORE_0_World_DRam0_PIF_REG (0x0154)

WCL_CORE_0_WORLD_DRAM0_PIF Stores the world info of CPU0's data bus and peripheral bus. This field is only used for debugging. (R/W)

Register 14.14. WCL_CORE_0_World_Phase_REG (0x0158)

WCL_CORE_0_WORLD_PHASE Indicates if the CPU0 is ready to switch from Non-secure World to Secure World. 1: ready; 2: not ready. (RO)

Register 14.15. WCL_CORE_0_NMI_MASK_ENABLE_REG (0x0180)

WCL_CORE_0_NMI_MASK_ENABLE Write any value to this field to start CPU0 masking any NMI interrupt. (WO)

Register 14.16. WCL_CORE_0_NMI_MASK_TRIGGER_ADDR_REG (0x0184)

WCL_CORE_0_NMI_MASK_TRIGGER_ADDR Configures the address at which the NMI masking stops for CPU0. (R/W)

Register 14.17. WCL_CORE_0_NMI_MASK_DISABLE_REG (0x0188)

WCL_CORE_0_NMI_MASK_DISABLE Write any value to this field so CPU0 checks NMI masking. (WO)

Register 14.18. WCL_CORE_0_NMI_MASK_CANCEL_REG (0x018C)

WCL_CORE_0_NMI_MASK_CANCEL Write any value to this field to cancel CPU0's NMI masking. (WO)

Register 14.19. WCL_CORE_0_NMI_MASK_REG (0x0190)

WCL_CORE_0_NMI_MASK Set this bit to mask all the NMI interrupts in CPU0. (R/W)

Register 14.20. WCL_CORE_0_NMI_MASK_PHASE_REG (0x0194)

WCL_CORE_0_NMI_MASK_PHASE Indicates if the NMI interrupt is being masked in CPU0. 1: masked; 0: not masked. (RO)

15 System Registers

15.1 Overview

The ESP32-S3 integrates a large number of peripherals, and enables the control of individual peripherals to achieve optimal characteristics in performance-vs-power-consumption scenarios. Specifically, ESP32-S3 has a various of system configuration registers that can be used for the chip's clock management (clock gating), power management, and the configuration of peripherals and core-system modules. This chapter lists all these system registers and their functions.

15.2 Features

ESP32-S3 system registers can be used to control the following peripheral blocks and core modules:

- System and memory
- Clock
- Software Interrupt
- Low-power management
- Peripheral clock gating and reset
- CPU Control

15.3 Function Description

15.3.1 System and Memory Registers

15.3.1.1 Internal Memory

The following registers can be used to control ESP32-S3's internal memory:

- In register [APB_CTRL_CLKGATE_FORCE_ON_REG](#):
 - Setting different bits of the [APB_CTRL_ROM_CLKGATE_FORCE_ON](#) field forces on the clock gates of different blocks of Internal ROM 0 and Internal ROM 1.
 - Setting different bits of the [APB_CTRL_SRAM_CLKGATE_FORCE_ON](#) field forces on the clock gates of different blocks of Internal SRAM.
 - This means when the respective bits of this register are set to 1, the clock gate of the corresponding ROM or SRAM blocks will always be on. Otherwise, the clock gate will turn on automatically when the corresponding ROM or SRAM blocks are accessed and turn off automatically when the corresponding ROM or SRAM blocks are not accessed. Therefore, it's recommended to configure these bits to 0 to lower power consumption.
- In register [APB_CTRL_MEM_POWER_DOWN_REG](#):
 - Setting different bits of the [APB_CTRL_ROM_POWER_DOWN](#) field sends different blocks of Internal ROM 0 and Internal ROM 1 into retention state.

- Setting different bits of the [APB_CTRL_SRAM_POWER_DOWN](#) field sends different blocks of Internal SRAM into retention state.
- The “Retention” state is a low-power state of a memory block. In this state, the memory block still holds all the data stored but cannot be accessed, thus reducing the power consumption. Therefore, you can send a certain block of memory into the retention state to reduce power consumption if you know you are not going to use such memory block for some time.
- In register [APB_CTRL_MEM_POWER_UP_REG](#):
 - By default, all memory enters low-power state when the chip enters the Light-sleep mode.
 - Setting different bits of the [APB_CTRL_ROM_POWER_UP](#) field forces different blocks of Internal ROM 0 and Internal ROM 1 to work as normal (do not enter the retention state) when the chip enters Light-sleep.
 - Setting different bits of the [APB_CTRL_SRAM_POWER_UP](#) field forces different blocks of Internal SRAM to work as normal (do not enter the retention state) when the chip enters Light-sleep.

For detailed information about the controlling bits of different blocks, please see Table 15-1 below.

Table 15-1. Internal Memory Controlling Bit

Internal Memory	Lowest Address1	Highest Address1	Lowest Address2	Highest Address2	Controlling Bit
Internal ROM 0	0x4000_0000	0x4003_FFFF	-	-	Bit0
Internal ROM 1	0x4004_0000	0x4004_FFFF	-	-	Bit1
Internal ROM 2	0x4005_0000	0x4005_FFFF	0x3FF0_0000	0x3FF0_FFFF	Bit2
SRAM Block0	0x4037_0000	0x4037_3FFF	-	-	Bit0
SRAM Block1	0x4037_4000	0x4037_7FFF	-	-	Bit1
SRAM Block2	0x4037_8000	0x4037_FFFF	0x3FC8_8000	0x3FC8_FFFF	Bit2
SRAM Block3	0x4038_0000	0x4038_FFFF	0x3FC9_0000	0x3FC9_FFFF	Bit3
SRAM Block4	0x4039_8000	0x4039_FFFF	0x3FCA_0000	0x3FCA_FFFF	Bit4
SRAM Block5	0x403A_C000	0x403A_FFFF	0x3FCB_C000	0x3FCB_FFFF	Bit5
SRAM Block6	0x403B_0000	0x403B_FFFF	0x3FCC_0000	0x3FCC_FFFF	Bit6
SRAM Block7	0x403C_0000	0x403C_FFFF	0x3FCD_4000	0x3FCD_FFFF	Bit7
SRAM Block8	0x403D_0000	0x403D_BFFF	0x3FCE_8000	0x3FCE_FFFF	Bit8
SRAM Block9	-	-	0x3FCF_0000	0x3FCF_7FFF	Bit9
SRAM Block10	-	-	0x3FCF_8000	0x3FCF_FFFF	Bit10

For detailed information about the controlling bits of different blocks, please see Table 15-1 below.

15.3.1.2 External Memory

[SYSTEM_EXTERNAL_DEVICE_ENCRYPT_DECRYPT_CONTROL_REG](#) configures encryption and decryption options of the external memory. For details, please refer to Chapter 21 *External Memory Encryption and Decryption (XTS_AES)*.

15.3.1.3 RSA Memory

[SYSTEM_RSA_PD_CTRL_REG](#) controls the SRAM memory in the RSA accelerator.

- Setting the `SYSTEM_RSA_MEM_PD` bit to send the RSA memory into retention state. This bit has the lowest priority, meaning it can be masked by the `SYSTEM_RSA_MEM_FORCE_PU` field. This bit is invalid when the *Digital Signature (DS)* occupies the RSA.
- Setting the `SYSTEM_RSA_MEM_FORCE_PU` bit to force the RSA memory to work as normal when the chip enters light sleep. This bit has the second highest priority, meaning it overrides the `SYSTEM_RSA_MEM_PD` field.
- Setting the `SYSTEM_RSA_MEM_FORCE_PD` bit to send the RSA memory into retention state. This bit has the highest priority, meaning it sends the RSA memory into retention state regardless of the `SYSTEM_RSA_MEM_FORCE_PU` field.

15.3.2 Clock Registers

The following registers are used to set clock sources and frequency. For more information, please refer to Chapter 6 *Reset and Clock*.

- `SYSTEM_CPU_PER_CONF_REG`
- `SYSTEM_SYSCLK_CONF_REG`
- `SYSTEM_BT_LPCK_DIV_FRAC_REG`

15.3.3 Interrupt Signal Registers

The following registers are used for generating the interrupt signals, which then can be routed to the CPU peripheral interrupts via the interrupt matrix. To be more specific, writing 1 to any of the following registers generates an interrupt signal. Therefore, these registers can be used by software to control interrupts. For more information, please refer to Chapter 8 *Interrupt Matrix (INTERRUPT)*.

- `SYSTEM_CPU_INTR_FROM_CPU_0_REG`
- `SYSTEM_CPU_INTR_FROM_CPU_1_REG`
- `SYSTEM_CPU_INTR_FROM_CPU_2_REG`
- `SYSTEM_CPU_INTR_FROM_CPU_3_REG`

15.3.4 Low-power Management Registers

The following registers are used for low-power management. For more information, please refer to Chapter 5 *Low-Power Management (RTC_CNTL) [to be added later]*.

- `SYSTEM_RTC_FASTMEM_CONFIG_REG`: configures the RTC CRC check.
- `SYSTEM_RTC_FASTMEM_CRC_REG`: configures the CRC check value.

15.3.5 Peripheral Clock Gating and Reset Registers

The following registers are used for controlling the clock gating and reset of different peripherals. Details can be seen in Table 15-2.

- `SYSTEM_CACHE_CONTROL_REG`
- `SYSTEM_EDMA_CTRL_REG`
- `SYSTEM_PERIP_CLK_EN0_REG`

- SYSTEM_PERIP_RST_EN0_REG
- SYSTEM_PERIP_CLK_EN1_REG
- SYSTEM_PERIP_RST_EN1_REG

Table 15-2. Peripheral Clock Gating and Reset Bits

Peripheral	Clock Enabling Bit ¹	Reset Controlling Bit ²³
EDMA Ctrl	SYSTEM_EDMA_CTRL_REG	
EDMA	SYSTEM_EDMA_CLK_ON	SYSTEM_EDMA_RESET
CACHE Ctrl	SYSTEM_CACHE_CONTROL_REG	
DCACHE	SYSTEM_DCACHE_CLK_ON	SYSTEM_DCACHE_RESET
ICACHE	SYSTEM_ICACHE_CLK_ON	SYSTEM_ICACHE_RESET
Peripheral	SYSTEM_PERIP_CLK_EN0_REG	
Timer Group0	SYSTEM_TIMERGROUP_CLK_EN	SYSTEM_TIMERGROUP_RST
Timer Group1	SYSTEM_TIMERGROUP1_CLK_EN	SYSTEM_TIMERGROUP1_RST
System Timer	SYSTEM_SYSTIMER_CLK_EN	SYSTEM_SYSTIMER_RST
UART0	SYSTEM_UART_CLK_EN	SYSTEM_UART_RST
UART1	SYSTEM_UART1_CLK_EN	SYSTEM_UART1_RST
UART MEM	SYSTEM_UART_MEM_CLK_EN ⁴	SYSTEM_UART_MEM_RST
SPI0 SPI1	SYSTEM_SPI01_CLK_EN	SYSTEM_SPI01_RST
SPI2	SYSTEM_SPI2_CLK_EN	SYSTEM_SPI2_RST
SPI3	SYSTEM_SPI3_CLK_EN	SYSTEM_SPI3_RST
I2C0	SYSTEM_I2C_EXT0_CLK_EN	SYSTEM_I2C_EXT0_RST
I2C1	SYSTEM_I2C_EXT1_CLK_EN	SYSTEM_I2C_EXT1_RST
I2S0	SYSTEM_I2S0_CLK_EN	SYSTEM_I2S0_RST
I2S1	SYSTEM_I2S1_CLK_EN	SYSTEM_I2S1_RST
TWAI Controller	SYSTEM_CAN_CLK_EN	SYSTEM_CAN_RST
UHCIO	SYSTEM_UHCIO_CLK_EN	SYSTEM_UHCIO_RST
USB	SYSTEM_USB_CLK_EN	SYSTEM_USB_RST
RMT	SYSTEM_RMT_CLK_EN	SYSTEM_RMT_RST
PCNT	SYSTEM_PCNT_CLK_EN	SYSTEM_PCNT_RST
PWM0	SYSTEM_PWM0_CLK_EN	SYSTEM_PWM0_RST
PWM1	SYSTEM_PWM1_CLK_EN	SYSTEM_PWM1_RST
LED_PWM Controller	SYSTEM_LEDC_CLK_EN	SYSTEM_LEDC_RST
ADC Controller	SYSTEM_ADC2_ARB_CLK_EN	SYSTEM_ADC2_ARB_RST
Accelerators	SYSTEM_PERIP_CLK_EN1_REG	
USB_DEVICE	SYSTEM_USB_DEVICE_CLK_EN	SYSTEM_USB_DEVICE_RST
UART2	SYSTEM_UART2_CLK_EN	SYSTEM_UART2_RST
LCD_CAM	SYSTEM_LCD_CAM_CLK_EN	SYSTEM_LCD_CAM_RST
SDIO_HOST	SYSTEM_SDIO_HOST_CLK_EN	SYSTEM_SDIO_HOST_RST
DMA	SYSTEM_DMA_CLK_EN	SYSTEM_DMA_RST ⁵
HMAC	SYSTEM_CRYPTO_HMAC_CLK_EN	SYSTEM_CRYPTO_HMAC_RST ⁶
Digital Signature	SYSTEM_CRYPTO_DS_CLK_EN	SYSTEM_CRYPTO_DS_RST ⁷
RSA Accelerator	SYSTEM_CRYPTO_RSA_CLK_EN	SYSTEM_CRYPTO_RSA_RST
SHA Accelerator	SYSTEM_CRYPTO_SHA_CLK_EN	SYSTEM_CRYPTO_SHA_RST

AES Accelerator	SYSTEM_CRYPT_AES_CLK_EN	SYSTEM_CRYPT_AES_RST
peri backup	SYSTEM_PERI_BACKUP_CLK_EN	SYSTEM_PERI_BACKUP_RST

Note:

1. Setting the clock enable register to 1 enables the clock, and to 0 disables the clock;
2. Setting the reset enabling register to 1 resets a peripheral, and to 0 disables the reset.
3. Reset registers cannot be cleared by hardware. Therefore, SW reset clear is required after setting the reset registers.
4. UART memory is shared by all UART peripherals, meaning having any active UART peripherals will prevent the UART memory from entering the clock-gated state.
5. When DMA is required for peripheral communications, for example, UCHI0, SPI, I2S, LCD_CAM, AES, SHA and ADC, DMA clock should also be enabled.
6. Resetting this bit also resets the SHA accelerator.
7. Resetting this bit also resets the AES, SHA, and RSA accelerators.

15.3.6 CPU Control Registers

These registers control CPU0 and CPU1 of ESP32-S3. Note that, by default, only CPU0 is started when the SoC powers up. During this time, the clock of CPU1 is disabled. Therefore, users need to enable CPU1 clock manually to use both CPU0 and CPU1.

- [SYSTEM_CORE_1_CONTROL_0_REG](#)
 - Setting the [SYSTEM_CONTROL_CORE_1_RESETING](#) bit resets CPU1.
 - [SYSTEM_CONTROL_CORE_1_CLKGATE_EN](#) controls the CPU1 clock.
 - Setting the [SYSTEM_CONTROL_CORE_1_RUNSTALL](#) bit stalls CPU1. When this bit is set, CPU1 will finish the on-going task and stalls.
- Register [SYSTEM_CORE_1_CONTROL_1_REG](#) is used to facilitate the communication between CPU0 and CPU1. To be more specific, one CPU can write this register, using the agreed-on formats, which will then be read by the other CPU, thus achieving communication between these two CPUs. Note that the value in this register will not affect any hardware configuration, which allows CPU communication solely controlled by software.

15.4 Register Summary

In this section, the addresses of all the registers starting with SYSTEM are relative to the base address of system registers provided in Table 3-3 in Chapter 3 *System and Memory*; and those starting with APB are relative to the base address of APB control also provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
SYSTEM_CORE_1_CONTROL_0_REG	Core1 control register 0	0x0000	R/W
SYSTEM_CORE_1_CONTROL_1_REG	Core1 control register 1	0x0004	R/W
SYSTEM_CPU_PER_CONF_REG	CPU peripheral clock configuration register	0x0010	R/W
SYSTEM_PERIP_CLK_EN0_REG	System peripheral clock enable register 0	0x0018	R/W
SYSTEM_PERIP_CLK_EN1_REG	System peripheral clock enable register 1	0x001C	R/W
SYSTEM_PERIP_RST_EN0_REG	System peripheral reset register 0	0x0020	R/W
SYSTEM_PERIP_RST_EN1_REG	System peripheral reset register 1	0x0024	R/W
SYSTEM_BT_LPCK_DIV_FRAC_REG	Low-power clock configuration register 1	0x002C	R/W
SYSTEM_CPU_INTR_FROM_CPU_0_REG	Software interrupt source register 0	0x0030	R/W
SYSTEM_CPU_INTR_FROM_CPU_1_REG	Software interrupt source register 1	0x0034	R/W
SYSTEM_CPU_INTR_FROM_CPU_2_REG	Software interrupt source register 2	0x0038	R/W
SYSTEM_CPU_INTR_FROM_CPU_3_REG	Software interrupt source register 3	0x003C	R/W
SYSTEM_RSA_PD_CTRL_REG	RSA memory power control register	0x0040	R/W
SYSTEM_EDMA_CTRL_REG	EDMA control register	0x0044	R/W
SYSTEM_CACHE_CONTROL_REG	Cache control register	0x0048	R/W
SYSTEM_EXTERNAL_DEVICE_ENCRYPT_DECRYPT_CONTROL_REG	External memory encryption and decryption control register	0x004C	R/W
SYSTEM_RTC_FASTMEM_CONFIG_REG	Fast memory CRC configuration register	0x0050	varies
SYSTEM_RTC_FASTMEM_CRC_REG	Fast memory CRC result register	0x0054	RO
SYSTEM_CLOCK_GATE_REG	System clock control register	0x005C	R/W
SYSTEM_SYSCLK_CONF_REG	System clock configuration register	0x0060	varies
SYSTEM_DATE_REG	Version register	0x0FFC	R/W

Name	Description	Address	Access
APB_CTRL_CLKGATE_FORCE_ON_REG	Internal memory clock gate enable register	0x00A8	R/W
APB_CTRL_MEM_POWER_DOWN_REG	Internal memory control register	0x00AC	R/W
APB_CTRL_MEM_POWER_UP_REG	Internal memory control register	0x00B0	R/W

Register 15.3. SYSTEM_CPU_PER_CONF_REG (0x0010)

SYSTEM_CPUPERIOD_SEL Set this field to select the CPU clock frequency. (R/W)

SYSTEM_PLL_FREQ_SEL Set this bit to select the PLL clock frequency. (R/W)

SYSTEM_CPU_WAIT_MODE_FORCE_ON Set this bit to force on the clock gate of CPU wait mode. Usually, after executing the WAITI instruction, CPU enters the wait mode, during which the clock gate of CPU is turned off until any interrupts occur. In this way, power consumption is reduced. However, if this bit is set, the clock gate of CPU is always on and will not be turned off by the WAITI instruction. (R/W)

SYSTEM_CPU_WAITI_DELAY_NUM Sets the number of delay cycles to turn off the CPU clock gate after the CPU enters the wait mode because of a WAITI instruction. (R/W)

Register 15.4. SYSTEM_PERIP_CLK_EN0_REG (0x0018)

31	30	29	28	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
0	1	1	0	0	0	0	1	1	0	0	0	0	0	0	1	1	0	1	0	0	0	0	0	0	1	1	0	0	1	1	0

Reset

SYSTEM_SPI01_CLK_EN Set this bit to enable SPI01 clock. (R/W)

SYSTEM_UART_CLK_EN Set this bit to enable UART clock. (R/W)

SYSTEM_I2S0_CLK_EN Set this bit to enable I2S0 clock. (R/W)

SYSTEM_UART1_CLK_EN Set this bit to enable UART1 clock. (R/W)

SYSTEM_SPI2_CLK_EN Set this bit to enable SPI2 clock. (R/W)

SYSTEM_I2C_EXT0_CLK_EN Set this bit to enable I2C_EXT0 clock. (R/W)

SYSTEM_UHCI0_CLK_EN Set this bit to enable UHCI0 clock. (R/W)

SYSTEM_RMT_CLK_EN Set this bit to enable RMT clock. (R/W)

SYSTEM_PCNT_CLK_EN Set this bit to enable PCNT clock. (R/W)

SYSTEM_LEDC_CLK_EN Set this bit to enable LEDC clock. (R/W)

SYSTEM_TIMERGROUP_CLK_EN Set this bit to enable TIMERGROUP0 clock. (R/W)

SYSTEM_TIMERGROUP1_CLK_EN Set this bit to enable TIMERGROUP1 clock. (R/W)

SYSTEM_SPI3_CLK_EN Set this bit to enable SPI3 clock. (R/W)

SYSTEM_PWM0_CLK_EN Set this bit to enable PWM0 clock. (R/W)

SYSTEM_I2C_EXT1_CLK_EN Set this bit to enable I2C_EXT1 clock. (R/W)

SYSTEM_CAN_CLK_EN Set this bit to enable CAN clock. (R/W)

SYSTEM_PWM1_CLK_EN Set this bit to enable PWM1 clock. (R/W)

SYSTEM_I2S1_CLK_EN Set this bit to enable I2S1 clock. (R/W)

SYSTEM_USB_CLK_EN Set this bit to enable USB clock. (R/W)

SYSTEM_UART_MEM_CLK_EN Set this bit to enable UART_MEM clock. (R/W)

SYSTEM_SYSTIMER_CLK_EN Set this bit to enable SYSTEM TIMER clock. (R/W)

SYSTEM_ADC2_ARB_CLK_EN Set this bit to enable ADC2_ARB clock. (R/W)

Register 15.6. SYSTEM_PERIP_RST_EN0_REG (0x0020)

31	30	29	28	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Reset

SYSTEM_SPI01_RST Set this bit to reset SPI01. (R/W)

SYSTEM_UART_RST Set this bit to reset UART. (R/W)

SYSTEM_I2S0_RST Set this bit to reset I2S0. (R/W)

SYSTEM_UART1_RST Set this bit to reset UART1. (R/W)

SYSTEM_SPI2_RST Set this bit to reset SPI2. (R/W)

SYSTEM_I2C_EXT0_RST Set this bit to reset I2C_EXT0. (R/W)

SYSTEM_UHCI0_RST Set this bit to reset UHCI0. (R/W)

SYSTEM_RMT_RST Set this bit to reset RMT. (R/W)

SYSTEM_PCNT_RST Set this bit to reset PCNT. (R/W)

SYSTEM_LEDC_RST Set this bit to reset LEDC. (R/W)

SYSTEM_TIMERGROUP_RST Set this bit to reset TIMERGROUP0. (R/W)

SYSTEM_TIMERGROUP1_RST Set this bit to reset TIMERGROUP1. (R/W)

SYSTEM_SPI3_RST Set this bit to reset SPI3. (R/W)

SYSTEM_PWM0_RST Set this bit to reset PWM0. (R/W)

SYSTEM_I2C_EXT1_RST Set this bit to reset I2C_EXT1. (R/W)

SYSTEM_CAN_RST Set this bit to reset CAN. (R/W)

SYSTEM_PWM1_RST Set this bit to reset PWM1. (R/W)

SYSTEM_I2S1_RST Set this bit to reset I2S1. (R/W)

SYSTEM_USB_RST Set this bit to reset USB. (R/W)

SYSTEM_UART_MEM_RST Set this bit to reset UART_MEM. (R/W)

SYSTEM_SYSTIMER_RST Set this bit to reset SYSTIMER. (R/W)

SYSTEM_ADC2_ARB_RST Set this bit to reset ADC2_ARB. (R/W)

Register 15.7. SYSTEM_PERIP_RST_EN1_REG (0x0024)

(reserved)											SYSTEM_USB_DEVICE_RST SYSTEM_UART2_RST SYSTEM_LCD_CAM_RST SYSTEM_SDIO_HOST_RST SYSTEM_DMA_RST SYSTEM_CRYPTO_HMAC_RST SYSTEM_CRYPTO_DS_RST SYSTEM_CRYPTO_RSA_RST SYSTEM_CRYPTO_SHA_RST SYSTEM_PERI_BACKUP_RST													
31											11	10	9	8	7	6	5	4	3	2	1	0		
0											0	0	1	1	1	1	1	1	1	1	1	1	0	Reset

SYSTEM_PERI_BACKUP_RST Set this bit to reset BACKUP. (R/W)

SYSTEM_CRYPTO_AES_RST Set this bit to reset CRYPTO_AES. (R/W)

SYSTEM_CRYPTO_SHA_RST Set this bit to reset CRYPTO_SHA. (R/W)

SYSTEM_CRYPTO_RSA_RST Set this bit to reset CRYPTO_RSA. (R/W)

SYSTEM_CRYPTO_DS_RST Set this bit to reset CRYPTO_DS. (R/W)

SYSTEM_CRYPTO_HMAC_RST Set this bit to reset CRYPTO_HMAC. (R/W)

SYSTEM_DMA_RST Set this bit to reset DMA. (R/W)

SYSTEM_SDIO_HOST_RST Set this bit to reset SDIO_HOST. (R/W)

SYSTEM_LCD_CAM_RST Set this bit to reset LCD_CAM. (R/W)

SYSTEM_UART2_RST Set this bit to reset UART2. (R/W)

SYSTEM_USB_DEVICE_RST Set this bit to reset USB_DEVICE. (R/W)

Register 15.10. SYSTEM_CPU_INTR_FROM_CPU_1_REG (0x0034)

SYSTEM_CPU_INTR_FROM_CPU_1 Set this bit to generate CPU interrupt 1. This bit needs to be reset by software in the ISR process. (R/W)

Register 15.11. SYSTEM_CPU_INTR_FROM_CPU_2_REG (0x0038)

SYSTEM_CPU_INTR_FROM_CPU_2 Set this bit to generate CPU interrupt 2. This bit needs to be reset by software in the ISR process. (R/W)

Register 15.12. SYSTEM_CPU_INTR_FROM_CPU_3_REG (0x003C)

SYSTEM_CPU_INTR_FROM_CPU_3 Set this bit to generate CPU interrupt 3. This bit needs to be reset by software in the ISR process. (R/W)

Register 15.15. SYSTEM_CACHE_CONTROL_REG (0x0048)

(reserved)																				SYSTEM_DCACHE_RESET SYSTEM_DCACHE_CLK_ON SYSTEM_ICACHE_RESET SYSTEM_ICACHE_CLK_ON					
31																				4	3	2	1	0	
0																				0	0	1	0	1	Reset

SYSTEM_ICACHE_CLK_ON Set this bit to enable i-cache clock. (R/W)

SYSTEM_ICACHE_RESET Set this bit to reset i-cache. (R/W)

SYSTEM_DCACHE_CLK_ON Set this bit to enable d-cache clock. (R/W)

SYSTEM_DCACHE_RESET Set this bit to reset d-cache. (R/W)

Register 15.16. SYSTEM_EXTERNAL_DEVICE_ENCRYPT_DECRYPT_CONTROL_REG (0x004C)

(reserved)																				SYSTEM_ENABLE_DOWNLOAD_MANUAL_ENCRYPT SYSTEM_ENABLE_DOWNLOAD_G0CB_DECRYPT SYSTEM_ENABLE_DOWNLOAD_DB_ENCRYPT SYSTEM_ENABLE_SPI_MANUAL_ENCRYPT					
31																				4	3	2	1	0	
0																				0	0	0	0	0	Reset

SYSTEM_ENABLE_SPI_MANUAL_ENCRYPT Set this bit to enable Manual Encryption under SPI Boot mode. (R/W)

SYSTEM_ENABLE_DOWNLOAD_DB_ENCRYPT Set this bit to enable Auto Encryption under Download Boot mode. (R/W)

SYSTEM_ENABLE_DOWNLOAD_G0CB_DECRYPT Set this bit to enable Auto Decryption under Download Boot mode. (R/W)

SYSTEM_ENABLE_DOWNLOAD_MANUAL_ENCRYPT Set this bit to enable Manual Encryption under Download Boot mode. (R/W)

Register 15.17. SYSTEM_RTC_FASTMEM_CONFIG_REG (0x0050)

SYSTEM_RTC_MEM_CRC_START Set this bit to start the CRC of RTC memory (R/W)

SYSTEM_RTC_MEM_CRC_ADDR This field is used to set address of RTC memory for CRC. (R/W)

SYSTEM_RTC_MEM_CRC_LEN This field is used to set length of RTC memory for CRC based on start address. (R/W)

SYSTEM_RTC_MEM_CRC_FINISH This bit stores the status of RTC memory CRC. High level means finished while low level means not finished. (RO)

Register 15.18. SYSTEM_RTC_FASTMEM_CRC_REG (0x0054)

SYSTEM_RTC_MEM_CRC_RES This field stores the CRC result of RTC memory. (RO)

Register 15.19. SYSTEM_CLOCK_GATE_REG (0x005C)

SYSTEM_CLK_EN Set this bit to enable the system clock. (R/W)

Register 15.20. SYSTEM_SYSCLK_CONF_REG (0x0060)

(reserved)										SYSTEM_CLK_XTAL_FREQ			SYSTEM_SOC_CLK_SEL			SYSTEM_PRE_DIV_CNT							
31											19	18				12	11	10	9				0
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0										0			0			0x1			Reset				

SYSTEM_PRE_DIV_CNT This field is used to set the count of prescaler of XTAL_CLK. For details, please refer to Table 6-4 in Chapter 6 *Reset and Clock*. (R/W)

SYSTEM_SOC_CLK_SEL This field is used to select SOC clock. For details, please refer to Table 6-2 in Chapter 6 *Reset and Clock*. (R/W)

SYSTEM_CLK_XTAL_FREQ This field is used to read XTAL frequency in MHz. (RO)

Register 15.21. SYSTEM_DATE_REG (0x0FFC)

(reserved)				SYSTEM_DATE														
31				28	27													0
0 0 0 0				0x2101220												Reset		

SYSTEM_DATE Version control register. (R/W)

Register 15.22. APB_CTRL_CLKGATE_FORCE_ON_REG (0x00A8)

(reserved)														APB_CTRL_SRAM_CLKGATE_FORCE_ON			APB_CTRL_ROM_CLKGATE_FORCE_ON				
31														14	13			3	2	0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0														0x7ff			0x7		Reset

16 SHA Accelerator (SHA)

16.1 Introduction

ESP32-S3 integrates an SHA accelerator, which is a hardware device that speeds up SHA algorithm significantly, compared to SHA algorithm implemented solely in software. The SHA accelerator integrated in ESP32-S3 has two working modes, which are [Typical SHA](#) and [DMA-SHA](#).

16.2 Features

The following functionality is supported:

- All the hash algorithms introduced in [FIPS PUB 180-4 Spec.](#)
 - SHA-1
 - SHA-224
 - SHA-256
 - SHA-384
 - SHA-512
 - SHA-512/224
 - SHA-512/256
 - SHA-512/*t*
- Two working modes
 - Typical SHA
 - DMA-SHA
- interleaved function when working in Typical SHA working mode
- Interrupt function when working in DMA-SHA working mode

16.3 Working Modes

The SHA accelerator integrated in ESP32-S3 has two working modes.

- [Typical SHA Working Mode](#): all the data is written and read via CPU directly.
- [DMA-SHA Working Mode](#): all the data is read via DMA. That is, users can configure the DMA controller to read all the data needed for hash operation, thus releasing CPU for completing other tasks.

Users can start the SHA accelerator with different working modes by configuring registers [SHA_START_REG](#) and [SHA_DMA_START_REG](#). For details, please see [Table 16-1](#).

Table 16-1. SHA Accelerator Working Mode

Working Mode	Configuration Method
Typical SHA	Set <code>SHA_START_REG</code> to 1
DMA-SHA	Set <code>SHA_DMA_START_REG</code> to 1

Users can choose hash algorithms by configuring the `SHA_MODE_REG` register. For details, please see Table 16-2.

Table 16-2. SHA Hash Algorithm Selection

Hash Algorithm	<code>SHA_MODE_REG</code> Configuration
SHA-1	0
SHA-224	1
SHA-256	2
SHA-384	3
SHA-512	4
SHA-512/224	5
SHA-512/256	6
SHA-512/ <i>t</i>	7

Notice:

ESP32-S3's [Digital Signature \(DS\)](#) and [HMAC Accelerator \(HMAC\)](#) modules also call the SHA accelerator. Therefore, users cannot access the SHA accelerator when these modules are working.

16.4 Function Description

SHA accelerator can generate the message digest via two steps: [Preprocessing](#) and [Hash operation](#).

16.4.1 Preprocessing

Preprocessing consists of three steps: [padding the message](#), [parsing the message into message blocks](#) and [setting the initial hash value](#).

16.4.1.1 Padding the Message

The SHA accelerator can only process message blocks of 512 or 1024 bits, depending on the algorithm. Thus, all the messages should be padded to a multiple of 512 or 1024 bits before the hash task.

Suppose that the length of the message M is m bits. Then M shall be padded as introduced below:

- **SHA-1, SHA-224 and SHA-256**

1. First, append the bit "1" to the end of the message;
2. Second, append k zero bits, where k is the smallest, non-negative solution to the equation $m + 1 + k \equiv 448 \pmod{512}$;
3. Last, append the 64-bit block of value equal to the number m expressed using a binary representation.

- **SHA-384, SHA-512, SHA-512/224, SHA-512/256 and SHA-512/*t***
 1. First, append the bit “1” to the end of the message;
 2. Second, append *k* zero bits, where *k* is the smallest, non-negative solution to the equation $m + 1 + k \equiv 896 \pmod{1024}$;
 3. Last, append the 128-bit block of value equal to the number *m* expressed using a binary representation.

For more details, please refer to Section “5.1 Padding the Message” in [FIPS PUB 180-4 Spec](#).

16.4.1.2 Parsing the Message

The message and its padding must be parsed into *N* 512-bit or 1024-bit blocks.

- For **SHA-1, SHA-224 and SHA-256**: the message and its padding are parsed into *N* 512-bit blocks, $M^{(1)}$, $M^{(2)}$, ..., $M^{(N)}$. Since the 512 bits of the input block may be expressed as sixteen 32-bit words, the first 32 bits of message block *i* are denoted $M_0^{(i)}$, the next 32 bits are $M_1^{(i)}$, and so on up to $M_{15}^{(i)}$.
- For **SHA-384, SHA-512, SHA-512/224, SHA-512/256 and SHA-512/*t***: the message and its padding are parsed into *N* 1024-bit blocks. Since the 1024 bits of the input block may be expressed as sixteen 64-bit words, the first 64 bits of message block *i* are denoted $M_0^{(i)}$, the next 64 bits are $M_1^{(i)}$, and so on up to $M_{15}^{(i)}$.

During the task, all the message blocks are written into the [SHA_M_n_REG](#), following the rules below:

- For **SHA-1, SHA-224 and SHA-256**: $M_0^{(i)}$ is stored in [SHA_M_0_REG](#), $M_1^{(i)}$ stored in [SHA_M_1_REG](#), ..., and $M_{15}^{(i)}$ stored in [SHA_M_15_REG](#).
- For **SHA-384, SHA-512, SHA-512/224 and SHA-512/256**: the most significant 32 bits and the least significant 32 bits of $M_0^{(i)}$ are stored in [SHA_M_0_REG](#) and [SHA_M_1_REG](#), respectively, ..., the most significant 32 bits and the least significant 32 bits of $M_{15}^{(i)}$ are stored in [SHA_M_30_REG](#) and [SHA_M_31_REG](#), respectively.

Note:

For more information about “message block”, please refer to Section “2.1 Glossary of Terms and Acronyms” in [FIPS PUB 180-4 Spec](#).

16.4.1.3 Initial Hash Value

Before hash task begins for each of the secure hash algorithms, the initial Hash value $H^{(0)}$ must be set based on different algorithms, among which the SHA-1, SHA-224, SHA-256, SHA-384, SHA-512, SHA-512/224, and SHA-512/256 algorithms use the initial Hash values (constant C) stored in the hardware.

However, SHA-512/*t* requires a distinct initial hash value for each operation for a given value of *t*. Simply put, SHA-512/*t* is the generic name for a *t*-bit hash function based on SHA-512 whose output is truncated to *t* bits. *t* is any positive integer without a leading zero such that $t < 512$, and *t* is not 384. The initial hash value for SHA-512/*t* for a given value of *t* can be calculated by performing SHA-512 from hexadecimal representation of the string “SHA-512/*t*”. It’s not hard to observe that when determining the initial hash values for SHA-512/*t* algorithms with different *t*, the only difference lies in the value of *t*.

Therefore, we have specially developed the following simplified method to calculate the initial hash value for SHA-512/*t*:

1. **Generate `t_string` and `t_length`:** `t_string` is a 32-bit data that stores the input message of t . `t_length` is a 7-bit data that stores the length of the input message. The `t_string` and `t_length` are generated in methods described below, depending on the value of t :

- If $1 \leq t \leq 9$, then $t_length = 7'h48$ and t_string is padded in the following format:

$8'h30 + 8'ht_0$	$1'b1$	$23'b0$
------------------	--------	---------

where $t_0 = t$.

For example, if $t = 8$, then $t_0 = 8$ and $t_string = 32'h38800000$.

- If $10 \leq t \leq 99$, then $t_length = 7'h50$ and t_string is padded in the following format:

$8'h30 + 8'ht_1$	$8'h30 + 8'ht_0$	$1'b1$	$15'b0$
------------------	------------------	--------	---------

where, $t_0 = t\%10$ and $t_1 = t/10$.

For example, if $t = 56$, then $t_0 = 6$, $t_1 = 5$, and $t_string = 32'h35368000$.

- If $100 \leq t < 512$, then $t_length = 7'h58$ and t_string is padded in the following format:

$8'h30 + 8'ht_2$	$8'h30 + 8'ht_1$	$8'h30 + 8'ht_0$	$1'b1$	$7'b0$
------------------	------------------	------------------	--------	--------

where, $t_0 = t\%10$, $t_1 = (t/10)\%10$, and $t_2 = t/100$.

For example, if $t = 231$, then $t_0 = 1$, $t_1 = 3$, $t_2 = 2$, and $t_string = 32'h32333180$.

2. **Initialize relevant registers:** Initialize `SHA_T_STRING_REG` and `SHA_T_LENGTH_REG` with the generated `t_string` and `t_length` in the previous step.
3. **Obtain initial hash value:** Set the `SHA_MODE_REG` register to 7. Set the `SHA_START_REG` register to 1 to start the SHA accelerator. Then poll register `SHA_BUSY_REG` until the content of this register becomes 0, indicating the calculation of initial hash value is completed.

Please note that the initial value for SHA-512/ t can be also calculated according to the Section “5.3.6 SHA-512/ t ” in [FIPS PUB 180-4 Spec](#), that is performing SHA-512 operation (with its initial hash value set to the result of 8-bitwise XOR operation of C and 0xa5) from the hexadecimal representation of the string “SHA-512/ t ”.

16.4.2 Hash task Process

After the preprocessing, the ESP32-S3 SHA accelerator starts to hash a message M and generates message digest of different lengths, depending on different hash algorithms. As described above, the ESP32-S3 SHA accelerator supports two working modes, which are [Typical SHA](#) and [DMA-SHA](#). The operation process for the SHA accelerator under two working modes is described in the following subsections.

16.4.2.1 Typical SHA Mode Process

Usually, the SHA accelerator will process all blocks of a message and produce a message digest before starting the next message digest.

However, ESP32-S3 SHA working in Typical SHA mode also supports optional “interleaved” message digest calculation. Users can insert new calculation (both Typical SHA and DMA-SHA) each time the SHA accelerator completes one message block. To be more specific, users can store the message digest in registers

[SHA_H_n_REG](#) after completing each message block, and assign the accelerator with other higher priority tasks. After the inserted calculation completes, users can put the message digest stored back to registers [SHA_H_n_REG](#), and resume the accelerator with the previously paused calculation.

Typical SHA Process (except for SHA-512/t)

1. Select a hash algorithm.
 - Configure the [SHA_MODE_REG](#) register based on Table 16-2.
2. Process the current message block ¹.
 - Write the message block in registers [SHA_M_n_REG](#).
3. Start the SHA accelerator.
 - If this is the first time to execute this step, set the [SHA_START_REG](#) register to 1 to start the SHA accelerator. In this case, the accelerator uses the initial hash value stored in hardware for a given algorithm configured in Step 1 to start the calculation;
 - If this is not the first time to execute this step², set the [SHA_CONTINUE_REG](#) register to 1 to start the SHA accelerator. In this case, the accelerator uses the hash value stored in the [SHA_H_n_REG](#) register to start calculation.
4. Check the progress of the current message block.
 - Poll register [SHA_BUSY_REG](#) until the content of this register becomes 0, indicating the accelerator has completed the calculation for the current message block and now is in the “idle” status ³.
5. Decide if you have more message blocks to process:
 - If yes, please go back to Step 2.
 - Otherwise, please continue.
6. Obtain the message digest.
 - Read the message digest from registers [SHA_H_n_REG](#).

Typical SHA Process (SHA-512/t)

1. Select a hash algorithm.
 - Configure the [SHA_MODE_REG](#) register to 7 for SHA-512/t.
2. Calculate the initial hash value.
 - (a) Calculate `t_string` and `t_length` and initialize [SHA_T_STRING_REG](#) and [SHA_T_LENGTH_REG](#) with the generated `t_string` and `t_length`. For details, please refer to Section 16.4.1.3.
 - (b) Set the [SHA_START_REG](#) register to 1 to start the SHA accelerator.
 - (c) Poll register [SHA_BUSY_REG](#) until the content of this register becomes 0, indicating the calculation of initial hash value is completed.
3. Process the current message block¹.
 - Write the message block in registers [SHA_M_n_REG](#).
4. Start the SHA accelerator

- Set the [SHA_CONTINUE_REG](#) register to 1. In this case, the accelerator uses the hash value stored in the [SHA_H_n_REG](#) register to start calculation.
5. Check the progress of the calculation.
 - Poll register [SHA_BUSY_REG](#) until the content of this register becomes 0, indicating the accelerator has completed the calculation for the current message block and now is in the “idle” status³.
 6. Decide if you have more message blocks to process:
 - If yes, please go back to Step 3.
 - Otherwise, please continue.
 7. Obtain the message digest.
 - Read the message digest from registers [SHA_H_n_REG](#).

Note:

1. In this step, the software can also write the next message block (to be processed) in registers [SHA_M_n_REG](#), if any, while the hardware starts SHA calculation, to save time.
2. You are resuming the SHA accelerator with the previously paused calculation.
3. Here you can decide if you want to insert other calculations. If yes, please go to the [process for interleaved calculations](#) for details.

As mentioned above, ESP32-S3 SHA accelerator supports “interleaving” calculation under the **Typical SHA working mode**.

The process to implement interleaved calculation is described below.

1. Prepare to hand the SHA accelerator over for an interleaved calculation by saving the following data of the previous calculation.
 - The selected hash algorithm stored in the [SHA_MODE_REG](#) register.
 - The message digest stored in registers [SHA_H_n_REG](#).
2. Perform the interleaved calculation. For the detailed process of the interleaved calculation, please refer to [Typical SHA process](#) or [DMA-SHA process](#), depending on the working mode of your interleaved calculation.
3. Prepare to hand the SHA accelerator back to the previously paused calculation by restoring the following data of the previous calculation.
 - Write the previously stored hash algorithm back to register [SHA_MODE_REG](#)
 - Write the previously stored message digest back to registers [SHA_H_n_REG](#)
4. Write the next message block from the previous paused calculation in registers [SHA_M_n_REG](#), and set the [SHA_CONTINUE_REG](#) register to 1 to restart the SHA accelerator with the previously paused calculation.

16.4.2.2 DMA-SHA Mode Process

ESP32-S3 SHA accelerator does not support “interleaving” message digest calculation when using the DMA, which means you cannot insert new calculation before the whole DMA-SHA process completes. In this case,

users who need inserted calculation are recommended to divide your message blocks and perform several DMA-SHA calculation, instead of trying to compute all the messages in one go.

In contrast to the Typical SHA working mode, when the SHA accelerator is working under the DMA-SHA mode, all data read are completed via DMA.

Therefore, users are required to configure the DMA controller following the description in Chapter 2 *GDMA Controller (GDMA)*.

DMA-SHA process (except SHA-512/t)

1. Select a hash algorithm.
 - Select a hash algorithm by configuring the [SHA_MODE_REG](#) register. For details, please refer to Table 16-2.
2. Configure the [SHA_INT_ENA_REG](#) register to enable or disable interrupt (Set 1 to enable).
3. Configure the number of message blocks.
 - Write the number of message blocks M to the [SHA_DMA_BLOCK_NUM_REG](#) register.
4. Start the DMA-SHA calculation.
 - If the current DMA-SHA calculation follows a previous calculation, firstly write the message digest from the previous calculation to registers [SHA_H_n_REG](#), then write 1 to register [SHA_DMA_CONTINUE_REG](#) to start SHA accelerator;
 - Otherwise, write 1 to register [SHA_DMA_START_REG](#) to start the accelerator.
5. Wait till the completion of the DMA-SHA calculation, which happens when:
 - The content of [SHA_BUSY_REG](#) register becomes 0, or
 - An SHA interrupt occurs. In this case, please clear interrupt by writing 1 to the [SHA_INT_CLEAR_REG](#) register.
6. Obtain the message digest:
 - Read the message digest from registers [SHA_H_n_REG](#).

DMA-SHA process for SHA-512/t

1. Select a hash algorithm.
 - Select SHA-512/t algorithm by configuring the [SHA_MODE_REG](#) register to 7.
2. Configure the [SHA_INT_ENA_REG](#) register to enable or disable interrupt (Set 1 to enable).
3. Calculate the initial hash value.
 - (a) Calculate t_string and t_length and initialize [SHA_T_STRING_REG](#) and [SHA_T_LENGTH_REG](#) with the generated t_string and t_length . For details, please refer to Section 16.4.1.3.
 - (b) Set the [SHA_START_REG](#) register to 1 to start the SHA accelerator.
 - (c) Poll register [SHA_BUSY_REG](#) until the content of this register becomes 0, indicating the calculation of initial hash value is completed.
4. Configure the number of message blocks.

- Write the number of message blocks M to the [SHA_DMA_BLOCK_NUM_REG](#) register.
5. Start the DMA-SHA calculation.
 - Write 1 to register [SHA_DMA_CONTINUE_REG](#) to start the accelerator.
 6. Wait till the completion of the DMA-SHA calculation, which happens when:
 - The content of [SHA_BUSY_REG](#) register becomes 0, or
 - An SHA interrupt occurs. In this case, please clear interrupt by writing 1 to the [SHA_INT_CLEAR_REG](#) register.
 7. Obtain the message digest:
 - Read the message digest from registers [SHA_H_n_REG](#).

16.4.3 Message Digest

After the hash task completes, the SHA accelerator writes the message digest from the task to registers [SHA_H_n_REG](#) (n : 0~15). The lengths of the generated message digest are different depending on different hash algorithms. For details, see Table 16-6 below:

Table 16-6. The Storage and Length of Message digest from Different Algorithms

Hash Algorithm	Length of Message Digest (in bits)	Storage ¹
SHA-1	160	SHA_H_0_REG ~ SHA_H_4_REG
SHA-224	224	SHA_H_0_REG ~ SHA_H_6_REG
SHA-256	256	SHA_H_0_REG ~ SHA_H_7_REG
SHA-384	384	SHA_H_0_REG ~ SHA_H_11_REG
SHA-512	512	SHA_H_0_REG ~ SHA_H_15_REG
SHA-512/224	224	SHA_H_0_REG ~ SHA_H_6_REG
SHA-512/256	256	SHA_H_0_REG ~ SHA_H_7_REG
SHA-512/ t^2	t	SHA_H_0_REG ~ SHA_H_x_REG

¹ The message digest are stored in registers from most significant bits to the least significant bits, with the first word stored in register [SHA_H_0_REG](#) and the second word stored in register [SHA_H_1_REG](#)... For details, please see subsection 16.4.1.2.

² The registers used for SHA-512/ t algorithm depend on the value of t . $x+1$ indicates the number of 32-bit registers used to store t bits of message digest, so that $x = \text{roundup}(t/32) - 1$. For example:

- When $t = 8$, then $x = 0$, indicating that the 8-bit long message digest is stored in the most significant 8 bits of register [SHA_H_0_REG](#);
- When $t = 32$, then $x = 0$, indicating that the 32-bit long message digest is stored in register [SHA_H_0_REG](#);
- When $t = 132$, then $x = 4$, indicating that the 132-bit long message digest is stored in registers [SHA_H_0_REG](#), [SHA_H_1_REG](#), [SHA_H_2_REG](#), [SHA_H_3_REG](#), and [SHA_H_4_REG](#).

16.4.4 Interrupt

SHA accelerator supports interrupt on the completion of message digest calculation when working in the DMA-SHA mode. To enable this function, write 1 to register [SHA_INT_ENA_REG](#). Note that the interrupt should be cleared by software after use via setting the [SHA_INT_CLEAR_REG](#) register to 1.

16.5 Register Summary

The addresses in this section are relative to the SHA accelerator base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
Control/Status registers			
SHA_CONTINUE_REG	Continues SHA operation (only effective in Typical SHA mode)	0x0014	WO
SHA_BUSY_REG	Indicates if SHA Accelerator is busy or not	0x0018	RO
SHA_DMA_START_REG	Starts the SHA accelerator for DMA-SHA operation	0x001C	WO
SHA_START_REG	Starts the SHA accelerator for Typical SHA operation	0x0010	WO
SHA_DMA_CONTINUE_REG	Continues SHA operation (only effective in DMA-SHA mode)	0x0020	WO
SHA_INT_CLEAR_REG	DMA-SHA interrupt clear register	0x0024	WO
SHA_INT_ENA_REG	DMA-SHA interrupt enable register	0x0028	R/W
Version Register			
SHA_DATE_REG	Version control register	0x002C	R/W
Configuration Registers			
SHA_MODE_REG	Defines the algorithm of SHA accelerator	0x0000	R/W
SHA_T_STRING_REG	String content register for calculating initial Hash Value (only effective for SHA-512/t)	0x0004	R/W
SHA_T_LENGTH_REG	String length register for calculating initial Hash Value (only effective for SHA-512/t)	0x0008	R/W
Memories			
SHA_DMA_BLOCK_NUM_REG	Block number register (only effective for DMA-SHA)	0x000C	R/W
SHA_H_0_REG	Hash value	0x0040	R/W
SHA_H_1_REG	Hash value	0x0044	R/W
SHA_H_2_REG	Hash value	0x0048	R/W
SHA_H_3_REG	Hash value	0x004C	R/W
SHA_H_4_REG	Hash value	0x0050	R/W
SHA_H_5_REG	Hash value	0x0054	R/W
SHA_H_6_REG	Hash value	0x0058	R/W
SHA_H_7_REG	Hash value	0x005C	R/W
SHA_H_8_REG	Hash value	0x0060	R/W
SHA_H_9_REG	Hash value	0x0064	R/W
SHA_H_10_REG	Hash value	0x0068	R/W

Name	Description	Address	Access
SHA_H_11_REG	Hash value	0x006C	R/W
SHA_H_12_REG	Hash value	0x0070	R/W
SHA_H_13_REG	Hash value	0x0074	R/W
SHA_H_14_REG	Hash value	0x0078	R/W
SHA_H_15_REG	Hash value	0x007C	R/W
SHA_M_0_REG	Message	0x0080	R/W
SHA_M_1_REG	Message	0x0084	R/W
SHA_M_2_REG	Message	0x0088	R/W
SHA_M_3_REG	Message	0x008C	R/W
SHA_M_4_REG	Message	0x0090	R/W
SHA_M_5_REG	Message	0x0094	R/W
SHA_M_6_REG	Message	0x0098	R/W
SHA_M_7_REG	Message	0x009C	R/W
SHA_M_8_REG	Message	0x00A0	R/W
SHA_M_9_REG	Message	0x00A4	R/W
SHA_M_10_REG	Message	0x00A8	R/W
SHA_M_11_REG	Message	0x00AC	R/W
SHA_M_12_REG	Message	0x00B0	R/W
SHA_M_13_REG	Message	0x00B4	R/W

16.6 Registers

The addresses in this section are relative to the SHA accelerator base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 16.5. SHA_DMA_CONTINUE_REG (0x0020)

SHA_DMA_CONTINUE Write 1 to continue DMA-SHA calculation. (WO)

Register 16.6. SHA_INT_CLEAR_REG (0x0024)

SHA_CLEAR_INTERRUPT Clears DMA-SHA interrupt. (WO)

Register 16.7. SHA_INT_ENA_REG (0x0028)

SHA_INTERRUPT_ENA Enables DMA-SHA interrupt. (R/W)

Register 16.8. SHA_DATE_REG (0x002C)

SHA_DATE Version control register. (R/W)

Register 16.9. SHA_MODE_REG (0x0000)

SHA_MODE Defines the SHA algorithm. For details, please see Table 16-2. (R/W)

Register 16.10. SHA_T_STRING_REG (0x0004)

SHA_T_STRING Defines t_string for calculating the initial Hash value for SHA-512/t. (R/W)

Register 16.11. SHA_T_LENGTH_REG (0x0008)

SHA_T_LENGTH Defines t_length for calculating the initial Hash value for SHA-512/t. (R/W)

Register 16.12. SHA_DMA_BLOCK_NUM_REG (0x000C)

SHA_DMA_BLOCK_NUM Defines the DMA-SHA block number. (R/W)

Register 16.13. SHA_H_n_REG (n : 0-15) ($0x0040+4*n$)

SHA_H_n Stores the n th 32-bit piece of the Hash value. (R/W)

Register 16.14. SHA_M_n_REG (n : 0-31) ($0x0080+4*n$)

SHA_M_n Stores the n th 32-bit piece of the message. (R/W)

17 AES Accelerator (AES)

17.1 Introduction

ESP32-S3 integrates an Advanced Encryption Standard (AES) Accelerator, which is a hardware device that speeds up AES Algorithm significantly, compared to AES algorithms implemented solely in software. The AES Accelerator integrated in ESP32-S3 has two working modes, which are [Typical AES](#) and [DMA-AES](#).

17.2 Features

The following functionality is supported:

- Typical AES working mode
 - AES-128/AES-256 encryption and decryption
- DMA-AES working mode
 - AES-128/AES-256 encryption and decryption
 - Block cipher mode
 - * ECB (Electronic Codebook)
 - * CBC (Cipher Block Chaining)
 - * OFB (Output Feedback)
 - * CTR (Counter)
 - * CFB8 (8-bit Cipher Feedback)
 - * CFB128 (128-bit Cipher Feedback)
 - Interrupt on completion of computation

17.3 AES Working Modes

The AES Accelerator integrated in ESP32-S3 has two working modes, which are [Typical AES](#) and [DMA-AES](#).

- Typical AES Working Mode:
 - Supports encryption and decryption using cryptographic keys of 128 and 256 bits, specified in [NIST FIPS 197](#).

In this working mode, the plaintext and ciphertext is written and read via CPU directly.

- DMA-AES Working Mode:
 - Supports encryption and decryption using cryptographic keys of 128 and 256 bits, specified in [NIST FIPS 197](#);
 - Supports block cipher modes ECB/CBC/OFB/CTR/CFB8/CFB128 under [NIST SP 800-38A](#).

In this working mode, the plaintext and ciphertext is written and read via DMA. An interrupt will be generated when operation completes.

Users can choose the working mode for AES accelerator by configuring the [AES_DMA_ENABLE_REG](#) register according to Table 17-1 below.

Table 17-1. AES Accelerator Working Mode

AES_DMA_ENABLE_REG	Working Mode
0	Typical AES
1	DMA-AES

Users can choose the length of cryptographic keys and encryption / decryption by configuring the [AES_MODE_REG](#) register according to Table 17-2 below.

Table 17-2. Key Length and Encryption / Decryption

AES_MODE_REG [2:0]	Key Length and Encryption / Decryption
0	AES-128 encryption
1	reserved
2	AES-256 encryption
3	reserved
4	AES-128 decryption
5	reserved
6	AES-256 decryption
7	reserved

For detailed introduction on these two working modes, please refer to Section 17.4 and Section 17.5 below.

Notice: ESP32-S3's [Digital Signature \(DS\)](#) module will call the AES accelerator. Therefore, users cannot access the AES accelerator when [Digital Signature \(DS\)](#) module is working.

17.4 Typical AES Working Mode

In the Typical AES working mode, users can check the working status of the AES accelerator by inquiring the [AES_STATE_REG](#) register and comparing the return value against the Table 17-3 below.

Table 17-3. Working Status under Typical AES Working Mode

AES_STATE_REG	Status	Description
0	IDLE	The AES accelerator is idle or completed operation.
1	WORK	The AES accelerator is in the middle of an operation.

17.4.1 Key, Plaintext, and Ciphertext

The encryption or decryption key is stored in [AES_KEY_n_REG](#), which is a set of eight 32-bit registers.

- For AES-128 encryption/decryption, the 128-bit key is stored in [AES_KEY_0_REG](#) ~ [AES_KEY_3_REG](#).
- For AES-256 encryption/decryption, the 256-bit key is stored in [AES_KEY_0_REG](#) ~ [AES_KEY_7_REG](#).

The plaintext and ciphertext are stored in [AES_TEXT_IN_m_REG](#) and [AES_TEXT_OUT_m_REG](#), which are two sets of four 32-bit registers.

- For AES-128/AES-256 encryption, the [AES_TEXT_IN_m_REG](#) registers are initialized with plaintext. Then, the AES Accelerator stores the ciphertext into [AES_TEXT_OUT_m_REG](#) after operation.
- For AES-128/AES-256 decryption, the [AES_TEXT_IN_m_REG](#) registers are initialized with ciphertext. Then, the AES Accelerator stores the plaintext into [AES_TEXT_OUT_m_REG](#) after operation.

17.4.2 Endianness

Text Endianness

In Typical AES working mode, the AES Accelerator uses cryptographic keys to encrypt and decrypt data in blocks of 128 bits. When filling data into [AES_TEXT_IN_m_REG](#) register or reading result from [AES_TEXT_OUT_m_REG](#) registers, users should follow the text endianness type specified in Table 17-4.

Table 17-4. Text Endianness Type for Typical AES

		Plaintext/Ciphertext			
State ¹		c ²			
		0	1	2	3
r	0	AES_TEXT_x_0_REG[7:0]	AES_TEXT_x_1_REG[7:0]	AES_TEXT_x_2_REG[7:0]	AES_TEXT_x_3_REG[7:0]
	1	AES_TEXT_x_0_REG[15:8]	AES_TEXT_x_1_REG[15:8]	AES_TEXT_x_2_REG[15:8]	AES_TEXT_x_3_REG[15:8]
	2	AES_TEXT_x_0_REG[23:16]	AES_TEXT_x_1_REG[23:16]	AES_TEXT_x_2_REG[23:16]	AES_TEXT_x_3_REG[23:16]
	3	AES_TEXT_x_0_REG[31:24]	AES_TEXT_x_1_REG[31:24]	AES_TEXT_x_2_REG[31:24]	AES_TEXT_x_3_REG[31:24]

¹ The definition of “State (including c and r)” is described in Section 3.4 The State in [NIST FIPS 197](#).

² Where $x = \text{IN or OUT}$.

Key Endianness

In Typical AES working mode, When filling key into [AES_KEY_m_REG](#) registers, users should follow the key endianness type specified in Table 17-5 and Table 17-6.

Table 17-5. Key Endianness Type for AES-128 Encryption and Decryption

Bit ¹	w[0]	w[1]	w[2]	w[3] ²
[31:24]	AES_KEY_0_REG[7:0]	AES_KEY_1_REG[7:0]	AES_KEY_2_REG[7:0]	AES_KEY_3_REG[7:0]
[23:16]	AES_KEY_0_REG[15:8]	AES_KEY_1_REG[15:8]	AES_KEY_2_REG[15:8]	AES_KEY_3_REG[15:8]
[15:8]	AES_KEY_0_REG[23:16]	AES_KEY_1_REG[23:16]	AES_KEY_2_REG[23:16]	AES_KEY_3_REG[23:16]
[7:0]	AES_KEY_0_REG[31:24]	AES_KEY_1_REG[31:24]	AES_KEY_2_REG[31:24]	AES_KEY_3_REG[31:24]

¹ Column “Bit” specifies the bytes of each word stored in w[0] ~ w[3].

² w[0] ~ w[3] are “the first Nk words of the expanded key” as specified in Section 5.2 Key Expansion in [NIST FIPS 197](#).

Table 17-6. Key Endianness Type for AES-256 Encryption and Decryption

Bit ¹	w[0]	w[1]	w[2]	w[3]	w[4]	w[5]	w[6]	w[7] ²
[31:24]	AES_KEY_0_REG[7:0]	AES_KEY_1_REG[7:0]	AES_KEY_2_REG[7:0]	AES_KEY_3_REG[7:0]	AES_KEY_4_REG[7:0]	AES_KEY_5_REG[7:0]	AES_KEY_6_REG[7:0]	AES_KEY_7_REG[7:0]
[23:16]	AES_KEY_0_REG[15:8]	AES_KEY_1_REG[15:8]	AES_KEY_2_REG[15:8]	AES_KEY_3_REG[15:8]	AES_KEY_4_REG[15:8]	AES_KEY_5_REG[15:8]	AES_KEY_6_REG[15:8]	AES_KEY_7_REG[15:8]
[15:8]	AES_KEY_0_REG[23:16]	AES_KEY_1_REG[23:16]	AES_KEY_2_REG[23:16]	AES_KEY_3_REG[23:16]	AES_KEY_4_REG[23:16]	AES_KEY_5_REG[23:16]	AES_KEY_6_REG[23:16]	AES_KEY_7_REG[23:16]
[7:0]	AES_KEY_0_REG[31:24]	AES_KEY_1_REG[31:24]	AES_KEY_2_REG[31:24]	AES_KEY_3_REG[31:24]	AES_KEY_4_REG[31:24]	AES_KEY_5_REG[31:24]	AES_KEY_6_REG[31:24]	AES_KEY_7_REG[31:24]

¹ Column “Bit” specifies the bytes of each word stored in w[0] ~ w[7].

² w[0] ~ w[7] are “the first Nk words of the expanded key” as specified in Chapter 5.2 Key Expansion in [NIST FIPS 197](#).

17.4.3 Operation Process

Single Operation

1. Write 0 to the [AES_DMA_ENABLE_REG](#) register.
2. Initialize registers [AES_MODE_REG](#), [AES_KEY_n_REG](#), [AES_TEXT_IN_m_REG](#).
3. Start operation by writing 1 to the [AES_TRIGGER_REG](#) register.
4. Wait till the content of the [AES_STATE_REG](#) register becomes 0, which indicates the operation is completed.
5. Read results from the [AES_TEXT_OUT_m_REG](#) register.

Consecutive Operations

In consecutive operations, primarily the input [AES_TEXT_IN_m_REG](#) and output [AES_TEXT_OUT_m_REG](#) registers are being written and read, while the content of [AES_DMA_ENABLE_REG](#), [AES_MODE_REG](#), [AES_KEY_n_REG](#) is kept unchanged. Therefore, the initialization can be simplified during the consecutive operation.

1. Write 0 to the [AES_DMA_ENABLE_REG](#) register before starting the first operation.
2. Initialize registers [AES_MODE_REG](#) and [AES_KEY_n_REG](#) before starting the first operation.
3. Update the content of [AES_TEXT_IN_m_REG](#).
4. Start operation by writing 1 to the [AES_TRIGGER_REG](#) register.
5. Wait till the content of the [AES_STATE_REG](#) register becomes 0, which indicates the operation completes.
6. Read results from the [AES_TEXT_OUT_m_REG](#) register, and return to Step 3 to continue the next operation.

17.5 DMA-AES Working Mode

In the DMA-AES working mode, the AES accelerator supports six block cipher modes including ECB/CBC/OFB/CTR/CFB8/CFB128. Users can choose the block cipher mode by configuring the [AES_BLOCK_MODE_REG](#) register according to Table 17-7 below.

Table 17-7. Block Cipher Mode

AES_BLOCK_MODE_REG [2:0]	Block Cipher Mode
0	ECB (Electronic Codebook)
1	CBC (Cipher Block Chaining)
2	OFB (Output Feedback)
3	CTR (Counter)
4	CFB8 (8-bit Cipher Feedback)
5	CFB128 (128-bit Cipher Feedback)
6	reserved
7	reserved

Users can check the working status of the AES accelerator by inquiring the [AES_STATE_REG](#) register and comparing the return value against the Table 17-8 below.

Table 17-8. Working Status under DMA-AES Working mode

AES_STATE_REG[1:0]	Status	Description
0	IDLE	The AES accelerator is idle.
1	WORK	The AES accelerator is in the middle of an operation.
2	DONE	The AES accelerator completed operations.

When working in the DMA-AES working mode, the AES accelerator supports interrupt on the completion of computation. To enable this function, write 1 to the [AES_INT_ENA_REG](#) register. By default, the interrupt function is disabled. Also, note that the interrupt should be cleared by software after use.

17.5.1 Key, Plaintext, and Ciphertext

Block Operation

During the block operations, the AES Accelerator reads source data from DMA, and write result data to DMA after the computation.

- For encryption, DMA reads plaintext from memory, then passes it to AES as source data. After computation, AES passes ciphertext as result data back to DMA to write into memory.
- For decryption, DMA reads ciphertext from memory, then passes it to AES as source data. After computation, AES passes plaintext as result data back to DMA to write into memory.

During block operations, the lengths of the source data and result data are the same. The total computation time is reduced because the DMA data operation and AES computation can happen concurrently.

The length of source data for AES Accelerator under DMA-AES working mode must be 128 bits or the integral multiples of 128 bits. Otherwise, trailing zeros will be added to the original source data, so the length of source data equals to the nearest integral multiples of 128 bits. Please see details in [Table 17-9](#) below.

Table 17-9. TEXT-PADDING

Function : TEXT-PADDING()	
Input	: X , bit string.
Output	: $Y = \text{TEXT-PADDING}(X)$, whose length is the nearest integral multiples of 128 bits.
Steps	
Let us assume that X is a data-stream that can be split into n parts as following:	
$X = X_1 X_2 \dots X_{n-1} X_n$	
Here, the lengths of X_1, X_2, \dots, X_{n-1} all equal to 128 bits, and the length of X_n is t ($0 < t <= 127$).	
If $t = 0$, then	
TEXT-PADDING (X) = X ;	
If $0 < t <= 127$, define a 128-bit block, X_n^* , and let $X_n^* = X_n 0^{128-t}$, then	
TEXT-PADDING (X) = $X_1 X_2 \dots X_{n-1} X_n^* = X 0^{128-t}$	

17.5.2 Endianness

Under the DMA-AES working mode, the transmission of source data and result data for AES Accelerator is solely controlled by DMA. Therefore, the AES Accelerator cannot control the Endianness of the source data and result

data, but does have requirement on how these data should be stored in memory and on the length of the data.

For example, let us assume DMA needs to write the following data into memory at address 0x0280.

- Data represented in hexadecimal:
 - 0102030405060708090A0B0C0D0E0F101112131415161718191A1B1C1D1E1F20
- Data Length:
 - Equals to 2 blocks.

Then, this data will be stored in memory as shown in Table 17-10 below.

Table 17-10. Text Endianness for DMA-AES

Address	Byte	Address	Byte	Address	Byte	Address	Byte
0x0280	0x01	0x0281	0x02	0x0282	0x03	0x0283	0x04
0x0284	0x05	0x0285	0x06	0x0286	0x07	0x0287	0x08
0x0288	0x09	0x0289	0x0A	0x028A	0x0B	0x028B	0x0C
0x028C	0x0D	0x028D	0x0E	0x028E	0x0F	0x028F	0x10
0x0290	0x11	0x0291	0x12	0x0292	0x13	0x0293	0x14
0x0294	0x15	0x0295	0x16	0x0296	0x17	0x0297	0x18
0x0298	0x19	0x0299	0x1A	0x029A	0x1B	0x029B	0x1C
0x029C	0x1D	0x029D	0x1E	0x029E	0x1F	0x029F	0x20

DMA can access both internal memory and PSRAM outside ESP32-S3. When you use DMA to access external PSRAM, please use base addresses that meet the requirements for DMA. When you use DMA to access internal memory, base addresses do not have such requirements. Details can be found in Chapter 2 *GDMA Controller (GDMA)*.

17.5.3 Standard Incrementing Function

AES accelerator provides two Standard Incrementing Functions for the CTR block operation, which are INC_{32} and INC_{128} Standard Incrementing Functions. By setting the `AES_INC_SEL_REG` register to 0 or 1, users can choose the INC_{32} or INC_{128} functions respectively. For details on the Standard Incrementing Function, please see Chapter B.1 The Standard Incrementing Function in [NIST SP 800-38A](#).

17.5.4 Block Number

Register `AES_BLOCK_NUM_REG` stores the Block Number of plaintext P or ciphertext C . The length of this register equals to $\text{length}(\text{TEXT-PADDING}(P))/128$ or $\text{length}(\text{TEXT-PADDING}(C))/128$. The AES Accelerator only uses this register when working in the DMA-AES mode.

17.5.5 Initialization Vector

`AES_IV_MEM` is a 16-byte memory, which is only available for AES Accelerator working in block operations. For CBC/OFB/CFB8/CFB128 operations, the `AES_IV_MEM` memory stores the Initialization Vector (IV). For the CTR operation, the `AES_IV_MEM` memory stores the Initial Counter Block (ICB).

Both IV and ICB are 128-bit strings, which can be divided into Byte0, Byte1, Byte2 . . . Byte15 (from left to right). [AES_IV_MEM](#) stores data following the Endianness pattern presented in Table 17-10, i.e. the most significant (i.e., left-most) byte Byte0 is stored at the lowest address while the least significant (i.e., right-most) byte Byte15 is stored at the highest address.

For more details on IV and ICB, please refer to [NIST SP 800-38A](#).

17.5.6 Block Operation Process

1. Select one of DMA channels to connect with AES, configure the DMA chained list, and then start DMA. For details, please refer to Chapter 2 *GDMA Controller (GDMA)*.
2. Initialize the AES accelerator-related registers:
 - Write 1 to the [AES_DMA_ENABLE_REG](#) register.
 - Configure the [AES_INT_ENA_REG](#) register to enable or disable the interrupt function.
 - Initialize registers [AES_MODE_REG](#) and [AES_KEY_n_REG](#).
 - Select block cipher mode by configuring the [AES_BLOCK_MODE_REG](#) register. For details, see Table 17-7.
 - Initialize the [AES_BLOCK_NUM_REG](#) register. For details, see Section 17.5.4.
 - Initialize the [AES_INC_SEL_REG](#) register (only needed when AES Accelerator is working under CTR block operation).
 - Initialize the [AES_IV_MEM](#) memory (This is always needed except for ECB block operation).
3. Start operation by writing 1 to the [AES_TRIGGER_REG](#) register.
4. Wait for the completion of computation, which happens when the content of [AES_STATE_REG](#) becomes 2 or the AES interrupt occurs.
5. Check if DMA completes data transmission from AES to memory. At this time, DMA had already written the result data in memory, which can be accessed directly. For details on DMA, please refer to Chapter 2 *GDMA Controller (GDMA)*.
6. Clear interrupt by writing 1 to the [AES_INT_CLR_REG](#) register, if any AES interrupt occurred during the computation.
7. Release the AES Accelerator by writing 0 to the [AES_DMA_EXIT_REG](#) register. After this, the content of the [AES_STATE_REG](#) register becomes 0. Note that, you can release DMA earlier, but only after Step 4 is completed.

17.6 Memory Summary

The addresses in this section are relative to the AES accelerator base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Size (byte)	Starting Address	Ending Address	Access
AES_IV_MEM	Memory IV	16 bytes	0x0050	0x005F	R/W

17.7 Register Summary

The addresses in this section are relative to the AES accelerator base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
Key Registers			
AES_KEY_0_REG	AES key register 0	0x0000	R/W
AES_KEY_1_REG	AES key register 1	0x0004	R/W
AES_KEY_2_REG	AES key register 2	0x0008	R/W
AES_KEY_3_REG	AES key register 3	0x000C	R/W
AES_KEY_4_REG	AES key register 4	0x0010	R/W
AES_KEY_5_REG	AES key register 5	0x0014	R/W
AES_KEY_6_REG	AES key register 6	0x0018	R/W
AES_KEY_7_REG	AES key register 7	0x001C	R/W
TEXT_IN Registers			
AES_TEXT_IN_0_REG	Source data register 0	0x0020	R/W
AES_TEXT_IN_1_REG	Source data register 1	0x0024	R/W
AES_TEXT_IN_2_REG	Source data register 2	0x0028	R/W
AES_TEXT_IN_3_REG	Source data register 3	0x002C	R/W
TEXT_OUT Registers			
AES_TEXT_OUT_0_REG	Result data register 0	0x0030	RO
AES_TEXT_OUT_1_REG	Result data register 1	0x0034	RO
AES_TEXT_OUT_2_REG	Result data register 2	0x0038	RO
AES_TEXT_OUT_3_REG	Result data register 3	0x003C	RO
Configuration Registers			
AES_MODE_REG	Defines key length and encryption / decryption	0x0040	R/W
AES_DMA_ENABLE_REG	Selects the working mode of the AES accelerator	0x0090	R/W
AES_BLOCK_MODE_REG	Defines the block cipher mode	0x0094	R/W
AES_BLOCK_NUM_REG	Block number configuration register	0x0098	R/W
AES_INC_SEL_REG	Standard incrementing function register	0x009C	R/W
Controlling / Status Registers			
AES_TRIGGER_REG	Operation start controlling register	0x0048	WO
AES_STATE_REG	Operation status register	0x004C	RO
AES_DMA_EXIT_REG	Operation exit controlling register	0x00B8	WO
Interrupt Registers			
AES_INT_CLR_REG	DMA-AES interrupt clear register	0x00AC	WO
AES_INT_ENA_REG	DMA-AES interrupt enable register	0x00B0	R/W

17.8 Registers

The addresses in this section are relative to the AES accelerator base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 17.1. AES_KEY_ n _REG (n : 0-7) (0x0000+4* n)

31	0
0x00000000	
Reset	

AES_KEY_ n _REG (n : 0-7) Stores AES keys. (R/W)

Register 17.2. AES_TEXT_IN_ m _REG (m : 0-3) (0x0020+4* m)

31	0
0x00000000	
Reset	

AES_TEXT_IN_ m _REG (m : 0-3) Stores the source data when the AES Accelerator operates in the Typical AES working mode. (R/W)

Register 17.3. AES_TEXT_OUT_ m _REG (m : 0-3) (0x0030+4* m)

31	0
0x00000000	
Reset	

AES_TEXT_OUT_ m _REG (m : 0-3) Stores the result data when the AES Accelerator operates in the Typical AES working mode. (RO)

Register 17.4. AES_MODE_REG (0x0040)

31	(reserved)	3	2	0
0x00000000				AES_MODE
0				Reset

AES_MODE Defines the key length and encryption / decryption of the AES Accelerator. For details, see Table 17-2. (R/W)

Register 17.5. AES_DMA_ENABLE_REG (0x0090)

31	(reserved)	1	0	
0x00000000				0
				Reset

AES_DMA_ENABLE Defines the working mode of the AES Accelerator. 0: Typical AES, 1: DMA-AES.
For details, see Table 17-1. (R/W)

Register 17.6. AES_BLOCK_MODE_REG (0x0094)

31	(reserved)	3	2	0	
0x00000000					0
					Reset

AES_BLOCK_MODE Defines the block cipher mode of the AES Accelerator operating under the DMA-AES working mode. For details, see Table 17-7. (R/W)

Register 17.7. AES_BLOCK_NUM_REG (0x0098)

31	0	
0x00000000		Reset

AES_BLOCK_NUM Stores the Block Number of plaintext or ciphertext when the AES Accelerator operates under the DMA-AES working mode. For details, see Section 17.5.4. (R/W)

Register 17.8. AES_INC_SEL_REG (0x009C)

31	(reserved)	1	0	
0x00000000				0
				Reset

AES_INC_SEL Defines the Standard Incrementing Function for CTR block operation. Set this bit to 0 or 1 to choose INC₃₂ or INC₁₂₈. (R/W)

Register 17.9. AES_TRIGGER_REG (0x0048)

31	(reserved)	1	0	AES_TRIGGER
0x00000000				
Reset				

AES_TRIGGER Set this bit to 1 to start AES operation. (WO)

Register 17.10. AES_STATE_REG (0x004C)

31	(reserved)	2	1	0	AES_STATE
0x00000000					
Reset					

AES_STATE Stores the working status of the AES Accelerator. For details, see Table 17-3 for Typical AES working mode and Table 17-8 for DMA AES working mode. (RO)

Register 17.11. AES_DMA_EXIT_REG (0x00B8)

31	(reserved)	1	0	AES_DMA_EXIT
0x00000000				
Reset				

AES_DMA_EXIT Set this bit to 1 to exit AES operation. This register is only effective for DMA-AES operation. (WO)

Register 17.12. AES_INT_CLR_REG (0x00AC)

31	(reserved)	1	0	AES_INT_CLR
0x00000000				
Reset				

AES_INT_CLR Set this bit to 1 to clear AES interrupt. (WO)

Register 17.13. AES_INT_ENA_REG (0x00B0)

31	(reserved)	1	0	AES_INT_ENA
0x00000000			0	Reset

AES_INT_ENA Set this bit to 1 to enable AES interrupt and 0 to disable interrupt. (R/W)

18 RSA Accelerator (RSA)

18.1 Introduction

The RSA Accelerator provides hardware support for high precision computation used in various RSA asymmetric cipher algorithms by significantly reducing their software complexity. Compared with RSA algorithms implemented solely in software, this hardware accelerator can speed up RSA algorithms significantly. Besides, the RSA Accelerator also supports operands of different lengths, which provides more flexibility during the computation.

18.2 Features

The following functionality is supported:

- Large-number modular exponentiation with two optional acceleration options
- Large-number modular multiplication
- Large-number multiplication
- Operands of different lengths
- Interrupt on completion of computation

18.3 Functional Description

The RSA Accelerator is activated by setting the `SYSTEM_CRYPTO_RSA_CLK_EN` bit in the `SYSTEM_PERIP_CLK_EN1_REG` register and clearing the `SYSTEM_RSA_MEM_PD` bit in the `SYSTEM_RSA_PD_CTRL_REG` register. This releases the RSA Accelerator from reset.

The RSA Accelerator is only available after the [RSA-related memories](#) are initialized. The content of the `RSA_CLEAN_REG` register is 0 during initialization and will become 1 after the initialization is done. Therefore, it is advised to wait until `RSA_CLEAN_REG` becomes 1 before using the RSA Accelerator.

The `RSA_INTERRUPT_ENA_REG` register is used to control the interrupt triggered on completion of computation. Write 1 or 0 to this register to enable or disable interrupt. By default, the interrupt function of the RSA Accelerator is enabled.

Notice:

ESP32-S3's [Digital Signature \(DS\)](#) module also calls the RSA accelerator. Therefore, users cannot access the RSA accelerator when [Digital Signature \(DS\)](#) is working.

18.3.1 Large Number Modular Exponentiation

Large-number modular exponentiation performs $Z = X^Y \bmod M$. The computation is based on Montgomery multiplication. Therefore, aside from the X , Y , and M arguments, two additional ones are needed — \bar{r} and M' , which need to be calculated in advance by software.

RSA Accelerator supports operands of length $N = 32 \times x$, where $x \in \{1, 2, 3, \dots, 128\}$. The bit lengths of arguments Z , X , Y , M , and \bar{r} can be arbitrary N , but all numbers in a calculation must be of the same length.

The bit length of M' must be 32.

To represent the numbers used as operands, let us define a base- b positional notation, as follows:

$$b = 2^{32}$$

Using this notation, each number is represented by a sequence of base- b digits:

$$n = \frac{N}{32}$$

$$Z = (Z_{n-1}Z_{n-2} \cdots Z_0)_b$$

$$X = (X_{n-1}X_{n-2} \cdots X_0)_b$$

$$Y = (Y_{n-1}Y_{n-2} \cdots Y_0)_b$$

$$M = (M_{n-1}M_{n-2} \cdots M_0)_b$$

$$\bar{r} = (\bar{r}_{n-1}\bar{r}_{n-2} \cdots \bar{r}_0)_b$$

Each of the n values in $Z_{n-1} \cdots Z_0$, $X_{n-1} \cdots X_0$, $Y_{n-1} \cdots Y_0$, $M_{n-1} \cdots M_0$, $\bar{r}_{n-1} \cdots \bar{r}_0$ represents one base- b digit (a 32-bit word).

Z_{n-1} , X_{n-1} , Y_{n-1} , M_{n-1} and \bar{r}_{n-1} are the most significant bits of Z , X , Y , M , while Z_0 , X_0 , Y_0 , M_0 and \bar{r}_0 are the least significant bits.

If we define $R = b^n$, the additional arguments can be calculated as $\bar{r} = R^2 \bmod M$.

The following equation in the form compatible with the extended binary GCD algorithm can be written as

$$M^{-1} \times M + 1 = R \times R^{-1}$$

$$M' = M^{-1} \bmod b$$

Large-number modular exponentiation can be implemented as follows:

1. Write 1 or 0 to the [RSA_INTERRUPT_ENA_REG](#) register to enable or disable the interrupt function.
2. Configure relevant registers:
 - (a) Write $(\frac{N}{32} - 1)$ to the [RSA_MODE_REG](#) register.
 - (b) Write M' to the [RSA_M_PRIME_REG](#) register.
 - (c) Configure registers related to the acceleration options, which are described later in Section 18.3.4.
3. Write X_i , Y_i , M_i and \bar{r}_i for $i \in \{0, 1, \dots, n - 1\}$ to memory blocks [RSA_X_MEM](#), [RSA_Y_MEM](#), [RSA_M_MEM](#) and [RSA_Z_MEM](#). The capacity of each memory block is 128 words. Each word of each memory block can store one base- b digit. The memory blocks use the little endian format for storage, i.e. the least significant digit of each number is in the lowest address.

Users need to write data to each memory block only according to the length of the number; data beyond this length are ignored.

4. Write 1 to the [RSA_MODEXP_START_REG](#) register to start computation.
5. Wait for the completion of computation, which happens when the content of [RSA_IDLE_REG](#) becomes 1 or the RSA interrupt occurs.

6. Read the result Z_i for $i \in \{0, 1, \dots, n - 1\}$ from [RSA_Z_MEM](#).
7. Write 1 to [RSA_CLEAR_INTERRUPT_REG](#) to clear the interrupt, if you have enabled the interrupt function.

After the computation, the [RSA_MODE_REG](#) register, memory blocks [RSA_Y_MEM](#) and [RSA_M_MEM](#), as well as the [RSA_M_PRIME_REG](#) remain unchanged. However, X_i in [RSA_X_MEM](#) and \bar{r}_i in [RSA_Z_MEM](#) computation are overwritten, and only these overwritten memory blocks need to be re-initialized before starting another computation.

18.3.2 Large Number Modular Multiplication

Large-number modular multiplication performs $Z = X \times Y \bmod M$. This computation is based on Montgomery multiplication. Therefore, similar to the large number modular exponentiation, two additional arguments are needed – \bar{r} and M' , which need to be calculated in advance by software.

The RSA Accelerator supports large-number modular multiplication with operands of 128 different lengths.

The computation can be executed as follows:

1. Write 1 or 0 to the [RSA_INTERRUPT_ENA_REG](#) register to enable or disable the interrupt function.
2. Configure relevant registers:
 - (a) Write $(\frac{N}{32} - 1)$ to the [RSA_MODE_REG](#) register.
 - (b) Write M' to the [RSA_M_PRIME_REG](#) register.
3. Write X_i , Y_i , M_i , and \bar{r}_i for $i \in \{0, 1, \dots, n - 1\}$ to memory blocks [RSA_X_MEM](#), [RSA_Y_MEM](#), [RSA_M_MEM](#) and [RSA_Z_MEM](#). The capacity of each memory block is 128 words. Each word of each memory block can store one base- b digit. The memory blocks use the little endian format for storage, i.e. the least significant digit of each number is in the lowest address.

Users need to write data to each memory block only according to the length of the number; data beyond this length are ignored.
4. Write 1 to the [RSA_MODMULT_START_REG](#) register.
5. Wait for the completion of computation, which happens when the content of [RSA_IDLE_REG](#) becomes 1 or the RSA interrupt occurs.
6. Read the result Z_i for $i \in \{0, 1, \dots, n - 1\}$ from [RSA_Z_MEM](#).
7. Write 1 to [RSA_CLEAR_INTERRUPT_REG](#) to clear the interrupt, if you have enabled the interrupt function.

After the computation, the length of operands in [RSA_MODE_REG](#), the X_i in memory [RSA_X_MEM](#), the Y_i in memory [RSA_Y_MEM](#), the M_i in memory [RSA_M_MEM](#), and the M' in memory [RSA_M_PRIME_REG](#) remain unchanged. However, the \bar{r}_i in memory [RSA_Z_MEM](#) has already been overwritten, and only this overwritten memory block needs to be re-initialized before starting another computation.

18.3.3 Large Number Multiplication

Large-number multiplication performs $Z = X \times Y$. The length of result Z is twice that of operand X and operand Y . Therefore, the RSA Accelerator only supports Large Number Multiplication with operand length $N = 32 \times x$, where $x \in \{1, 2, 3, \dots, 64\}$. The length \hat{N} of result Z is $2 \times N$.

The computation can be executed as follows:

1. Write 1 or 0 to the [RSA_INTERRUPT_ENA_REG](#) register to enable or disable the interrupt function.
2. Write $(\frac{\hat{N}}{32} - 1)$, i.e. $(\frac{N}{16} - 1)$ to the [RSA_MODE_REG](#) register.
3. Write X_i and Y_i for $i \in \{0, 1, \dots, n - 1\}$ to memory blocks [RSA_X_MEM](#) and [RSA_Z_MEM](#). The capacity of each memory block is 64 words. Each word of each memory block can store one base- b digit. The memory blocks use the little endian format for storage, i.e. the least significant digit of each number is in the lowest address. n is $\frac{N}{32}$.

Write X_i for $i \in \{0, 1, \dots, n - 1\}$ to the address of the i words of the [RSA_X_MEM](#) memory block. Note that Y_i for $i \in \{0, 1, \dots, n - 1\}$ will not be written to the address of the i words of the [RSA_Z_MEM](#) register, but the address of the $n + i$ words, i.e. the base address of the [RSA_Z_MEM](#) memory plus the address offset $4 \times (n + i)$.

Users need to write data to each memory block only according to the length of the number; data beyond this length are ignored.

4. Write 1 to the [RSA_MULT_START_REG](#) register.
5. Wait for the completion of computation, which happens when the content of [RSA_IDLE_REG](#) becomes 1 or the RSA interrupt occurs.
6. Read the result Z_i for $i \in \{0, 1, \dots, \hat{n} - 1\}$ from the [RSA_Z_MEM](#) register. \hat{n} is $2 \times n$.
7. Write 1 to [RSA_CLEAR_INTERRUPT_REG](#) to clear the interrupt, if you have enabled the interrupt function.

After the computation, the length of operands in [RSA_MODE_REG](#) and the X_i in memory [RSA_X_MEM](#) remain unchanged. However, the Y_i in memory [RSA_Z_MEM](#) has already been overwritten, and only this overwritten memory block needs to be re-initialized before starting another computation.

18.3.4 Options for Acceleration

The ESP32-S3 RSA accelerator also provides [SEARCH](#) and [CONSTANT_TIME](#) options that can be configured to accelerate the large-number modular exponentiation. By default, both options are configured for no acceleration. Users can choose to use one or two of these options to accelerate the computation.

To be more specific, when neither of these two options are configured for acceleration, the time required to calculate $Z = X^Y \bmod M$ is solely determined by the lengths of operands. When either or both of these two options are configured for acceleration, the time required is also correlated with the 0/1 distribution of Y .

To better illustrate how these two options work, first assume Y is represented in binaries as

$$Y = (\tilde{Y}_{N-1}\tilde{Y}_{N-2}\cdots\tilde{Y}_{t+1}\tilde{Y}_t\tilde{Y}_{t-1}\cdots\tilde{Y}_0)_2$$

where,

- N is the length of Y ,
- \tilde{Y}_t is 1,
- $\tilde{Y}_{N-1}, \tilde{Y}_{N-2}, \dots, \tilde{Y}_{t+1}$ are all equal to 0,
- and $\tilde{Y}_{t-1}, \tilde{Y}_{t-2}, \dots, \tilde{Y}_0$ are either 0 or 1 but exactly m bits should be equal to 0 and $t-m$ bits 1, i.e. the Hamming weight of $\tilde{Y}_{t-1}\tilde{Y}_{t-2}, \dots, \tilde{Y}_0$ is $t - m$.

When either of these two options is configured for acceleration:

- SEARCH Option (Configuring [RSA_SEARCH_ENABLE](#) to 1 for acceleration)
 - The accelerator ignores the bit positions of \tilde{Y}_i , where $i > \alpha$. Search position α is set by configuring the [RSA_SEARCH_POS_REG](#) register. The maximum value of α is $N-1$, which leads to the same result when this option is not used for acceleration. The best acceleration performance can be achieved by setting α to t , in which case, all the $\tilde{Y}_{N-1}, \tilde{Y}_{N-2}, \dots, \tilde{Y}_{t+1}$ of 0s are ignored during the calculation. Note that if you set α to be less than t , then the result of the modular exponentiation $Z = X^Y \bmod M$ will be incorrect.
- CONSTANT_TIME Option (Configuring [RSA_CONSTANT_TIME_REG](#) to 0 for acceleration)
 - The accelerator speeds up the calculation by simplifying the calculation concerning the 0 bits of Y . Therefore, the higher the proportion of bits 0 against bits 1, the better the acceleration performance is.

We provide an example to demonstrate the performance of the RSA Accelerator under different combinations of [SEARCH](#) and [CONSTANT_TIME](#) configuration. Here we perform $Z = X^Y \bmod M$ with $N = 3072$ and $Y = 65537$. Table 18-1 below demonstrates the time costs under different combinations of [SEARCH](#) and [CONSTANT_TIME](#) configuration. Here, we should also mention that, α is set to 16 when the SEARCH option is enabled.

Table 18-1. Acceleration Performance

SEARCH Option	CONSTANT_TIME Option	Time Cost (ms)
No acceleration	No acceleration	752.81
Accelerated	No acceleration	4.52
No acceleration	Acceleration	2.406
Acceleration	Acceleration	2.33

It's obvious that:

- The time cost is the biggest when none of these two options is configured for acceleration.
- The time cost is the smallest when both of these two options are configured for acceleration.
- The time cost can be dramatically reduced when either or both option(s) are configured for acceleration.

18.4 Memory Summary

The addresses in this section are relative to the RSA accelerator base address provided in Table 3-3 in Chapter 3 [System and Memory](#).

Table 18-2. RSA Accelerator Memory Blocks

Name	Description	Size (byte)	Starting Address	Ending Address	Access
RSA_M_MEM	Memory M	512	0x0000	0x01FF	WO
RSA_Z_MEM	Memory Z	512	0x0200	0x03FF	R/W
RSA_Y_MEM	Memory Y	512	0x0400	0x05FF	WO
RSA_X_MEM	Memory X	512	0x0600	0x07FF	WO

18.5 Register Summary

The addresses in this section are relative to the RSA accelerator base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
Configuration Registers			
RSA_M_PRIME_REG	Register to store M'	0x0800	R/W
RSA_MODE_REG	RSA length mode	0x0804	R/W
RSA_CONSTANT_TIME_REG	The constant_time option	0x0820	R/W
RSA_SEARCH_ENABLE_REG	The search option	0x0824	R/W
RSA_SEARCH_POS_REG	The search position	0x0828	R/W
Status/Control Registers			
RSA_CLEAN_REG	RSA clean register	0x0808	RO
RSA_MODEXP_START_REG	Modular exponentiation starting bit	0x080C	WO
RSA_MODMULT_START_REG	Modular multiplication starting bit	0x0810	WO
RSA_MULT_START_REG	Normal multiplication starting bit	0x0814	WO
RSA_IDLE_REG	RSA idle register	0x0818	RO
Interrupt Registers			
RSA_CLEAR_INTERRUPT_REG	RSA clear interrupt register	0x081C	WO
RSA_INTERRUPT_ENA_REG	RSA interrupt enable register	0x082C	R/W
Version Register			
RSA_DATE_REG	Version control register	0x0830	R/W

18.6 Registers

The addresses in this section are relative to the RSA accelerator base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 18.1. RSA_M_PRIME_REG (0x0800)

31	0
0x00000000	
Reset	

RSA_M_PRIME_REG Stores M'. (R/W)

Register 18.2. RSA_MODE_REG (0x0804)

31	7	6	0
(reserved)		RSA_MODE	
0 0		0 0 0 0 0 0 0 0	
Reset			

RSA_MODE Stores the mode of modular exponentiation. (R/W)

Register 18.7. RSA_IDLE_REG (0x0818)

RSA_IDLE The content of this bit is 1 when the RSA accelerator is idle. (RO)

Register 18.8. RSA_CLEAR_INTERRUPT_REG (0x081C)

RSA_CLEAR_INTERRUPT Set this bit to 1 to clear the RSA interrupts. (WO)

Register 18.9. RSA_CONSTANT_TIME_REG (0x0820)

RSA_CONSTANT_TIME_REG Controls the constant_time option. 0: acceleration. 1: no acceleration (by default). (R/W)

Register 18.10. RSA_SEARCH_ENABLE_REG (0x0824)

RSA_SEARCH_ENABLE Controls the search option. 0: no acceleration (by default). 1: acceleration. (R/W)

Register 18.11. RSA_SEARCH_POS_REG (0x0828)

RSA_SEARCH_POS Is used to configure the starting address when the acceleration option of search is used. (R/W)

Register 18.12. RSA_INTERRUPT_ENA_REG (0x082C)

RSA_INTERRUPT_ENA Set this bit to 1 to enable the RSA interrupt. This option is enabled by default. (R/W)

Register 18.13. RSA_DATE_REG (0x0830)

RSA_DATE Version control register. (R/W)

19 HMAC Accelerator (HMAC)

The Hash-based Message Authentication Code (HMAC) module computes Message Authentication Codes (MACs) using Hash algorithm and keys as described in RFC 2104. The underlying hash algorithm is SHA-256, and the 256-bit HMAC key is stored in an eFuse key block and can be set as read-protected for users.

19.1 Main Features

- Standard HMAC-SHA-256 algorithm
- Hash result only accessible by configurable hardware peripheral (in downstream mode)
- Compatible to challenge-response authentication algorithm
- Generates required keys for the Digital Signature (DS) peripheral (in downstream mode)
- Re-enables soft-disabled JTAG (in downstream mode)

19.2 Functional Description

The HMAC module operates in two modes: upstream mode and downstream mode. In upstream mode, the HMAC message is provided by the user and the calculation result is read back by the user; in downstream mode, the HMAC module is used as a Key Derivation Function (KDF) for other internal hardware. For instance, the JTAG can be temporarily disabled by burning odd number bits of `EFUSE_SOFT_DIS_JTAG` in eFuse. In this case, users can temporarily re-enable JTAG using the HMAC module in downstream mode.

After the reset signal being released, the HMAC module will check whether the DS key exists in the eFuse. If the key exists, the HMAC module will enter downstream digital signature mode and finish the DS key calculation automatically.

19.2.1 Upstream Mode

Common use cases for the upstream mode are challenge-response protocols supporting HMAC-SHA-256 algorithm. In upstream mode, the user should provide the related HMAC information and read back its calculation results.

Assume the two entities in the challenge-response protocol are A and B respectively, and the entities share the same secret KEY. The data message they expect to exchange is M. The general process of this protocol is as follows:

- A calculates a unique random number M
- A sends M to B
- B calculates the HMAC value (through M and KEY) and sends the result to A
- A also calculates the HMAC value (through M and KEY) internally
- A compares these two values. If they are the same, then the identity of B is authenticated

To calculate the HMAC value (the following steps should be done by the user):

1. Initialize the HMAC module, and enter upstream mode.
2. Write the correctly padded message to the HMAC, one block at a time.

3. Read back the result from HMAC.

For details of this process, please see Section [19.2.6](#).

19.2.2 Downstream JTAG Enable Mode

There are two parameters in the eFuse memory to disable JTAG debugging, namely [EFUSE_DIS_PAD_JTAG](#) and [EFUSE_SOFT_DIS_JTAG](#). Set [EFUSE_DIS_PAD_JTAG](#) to 1 can disable JTAG permanently, and set odd numbers of 1 to [EFUSE_SOFT_DIS_JTAG](#) can disable JTAG temporarily. For more details, please see Chapter [4 eFuse Controller](#).

To re-enable the temporarily disabled JTAG, users can follow the steps below:

1. Enable the HMAC module and enter downstream JTAG enable mode.
2. Write 1 to the [HMAC_SOFT_JTAG_CTRL_REG](#) register to enter JTAG re-enable compare mode.
3. Write the 256-bit HMAC value which is calculated locally from the 32-byte 0x00 using HMAC-SHA-256 algorithm and the pre-generated key to register [HMAC_WR_JTAG_REG](#), in big-endian order of word.
4. If the HMAC internally calculated value matches the value that user programmed, then JTAG is re-enabled. Otherwise, JTAG remains disabled.
5. JTAG remains in the status as in step 4 until the user writes 1 to register [HMAC_SET_INVALIDATE_JTAG_REG](#) or restart JTAG.

For detailed steps of this process, please see Section [19.2.6](#).

19.2.3 Downstream Digital Signature Mode

The Digital Signature (DS) module encrypts its parameters using AES-CBC algorithm. The HMAC module is used as a Key Derivation Function (KDF) to derive the AES key to decrypt these parameters.

Before starting the DS module, the user needs to obtain the key for it first through HMAC calculation. For more information, please see Chapter [20 Digital Signature \(DS\)](#). After the clock of HMAC be enabled and reset of HMAC be released, the HMAC module will check to see if there is a functional key in eFuses for the DS module. If yes, HMAC will enter downstream digital signature mode and finish DS key calculation automatically.

19.2.4 HMAC eFuse Configuration

The HMAC module provides three different functionalities: re-enabling JTAG and serving as DS KDF in downstream mode as well as pure HMAC calculation in upstream mode. Table [19-1](#) lists the register value corresponding to each purpose, which should be written to register [HMAC_SET_PARA_PURPOSE_REG](#) by the user (see Section [19.2.6](#)).

Table 19-1. HMAC Purposes and Configuration Values

Purpose	Mode	Value	Description
JTAG Re-enable	Downstream	6	EFUSE_KEY_PURPOSE_HMAC_DOWN_JTAG
DS Key Derivation	Downstream	7	EFUSE_KEY_PURPOSE_HMAC_DOWN_DIGITAL_SIGNATURE
HMAC Calculation	Upstream	8	EFUSE_KEY_PURPOSE_HMAC_UP
Both JTAG Re-enable and DS KDF	Downstream	5	EFUSE_KEY_PURPOSE_HMAC_DOWN_ALL

Before enabling HMAC to do calculations, user should make sure the key to be used has been burned in eFuse. You can burn a key to eFuse as follows:

1. Prepare a secret 256-bit HMAC key and burn the key to an empty eFuse block y (there are six blocks for storing a key in eFuse. The numbers of those blocks range from 4 to 9, so $y = 4, 5, \dots, 9$. Hence, if we are talking about key0, we mean eFuse block4), and then program the purpose to `EFUSE_KEY_PURPOSE_(y - 4)`. Take upstream mode as an example: after programming the key, the user should program `EFUSE_KEY_PURPOSE_HMAC_UP` (corresponding value is 8) to `EFUSE_KEY_PURPOSE_(y - 4)`. Please see Chapter 4 *eFuse Controller* on how to program eFuse keys.
2. Configure this eFuse key block to be read protected, so that users cannot read its value. A copy of this key should be kept by any party who needs to verify this device.

19.2.5 HMAC Initialization

The eFuse key blocks (with correctly programmed purpose values) must be coordinated with the HMAC modes, or HMAC will terminate calculation.

Configure HMAC modes

The correct purpose (see Table 19-1) has to be written to register `HMAC_SET_PARA_PURPOSE_REG` by the user.

Select eFuse Key Blocks

The eFuse controller provides six key blocks, i.e., KEY0 ~ 5. To select a particular KEY n for a certain HMAC calculation, write the key number n to register `HMAC_SET_PARA_KEY_REG`.

Note that the purpose of the key has also been programmed to eFuse memory. Only when the configured HMAC purpose matches the defined purpose of KEY n , will the HMAC module execute the configured calculation. Otherwise, it will return a matching error and stop the current calculation. For example, suppose a user selects KEY3 for HMAC calculation, and the value programmed to `KEY_PURPOSE_3` is 6 (`EFUSE_KEY_PURPOSE_HMAC_DOWN_JTAG`). Based on Table 19-1, KEY3 can be used to re-enable JTAG. If the value written to register `HMAC_SET_PARA_PURPOSE_REG` is also 6, then the HMAC module will start the process to re-enable JTAG.

19.2.6 HMAC Process (Detailed)

The process to call HMAC in ESP32-S3 is as follows:

1. Enable HMAC module

(a) Set the peripheral clock bits for HMAC and SHA peripherals in `SYSTEM_PEIRP_CLK_EN1_REG`, and clear the corresponding peripheral reset bits in `SYSTEM_PEIRP_RST_EN1_REG`. For registers information, please see Chapter 3 *System and Memory*.

(b) Write 1 to register `HMAC_SET_START_REG`.

2. Configure HMAC keys and key purposes

(a) Write the key purpose m to register `HMAC_SET_PARA_PURPOSE_REG`. The possible key purpose values are shown in Table 19-1. For more information, please refer to Section 19.2.4.

(b) Select `KEY n` in eFuse memory as the key by writing n (0 ~ 5) to register `HMAC_SET_PARA_KEY_REG`. For more information, please refer to Section 19.2.5.

(c) Write 1 to register `HMAC_SET_PARA_FINISH_REG` to complete the configuration.

(d) Read register `HMAC_QUERY_ERROR_REG`. If its value is 1, it means the purpose of the selected block does not match the configured key purpose and the calculation will not proceed. If its value is 0, it means the purpose of the selected block matches the configured key purpose, and then the calculation can proceed.

(e) When the value of `HMAC_SET_PARA_PURPOSE_REG` is not 8, it means the HMAC module is in downstream mode, proceed with Step 3. When the value is 8, it means the HMAC module is in upstream mode, proceed with Step 4.

3. Downstream mode

(a) Poll Status register `HMAC_QUERY_BUSY_REG`. When the value of this register is 0, HMAC calculation in downstream mode is completed.

(b) In downstream mode, the calculation result is used by either the JTAG or DS module in the hardware. To clear the result and make further usage of the dependent hardware (JTAG or DS), write 1 to either register `HMAC_SET_INVALIDATE_JTAG_REG` to clear the result generated by JTAG key; or to register `HMAC_SET_INVALIDATE_DS_REG` to clear the result generated by DS key.

(c) Downstream mode operation completed.

4. Transmit message block Block $_n$ ($n \geq 1$) in upstream mode

(a) Poll Status register `HMAC_QUERY_BUSY_REG`. When the value of this register is 0, go to step 4(b).

(b) Write the 512-bit Block $_n$ to register `HMAC_WDATA0~15_REG`. Write 1 to register `HMAC_SET_MESSAGE_ONE_REG`, to trigger the processing of this message block.

(c) Poll Status register `HMAC_QUERY_BUSY_REG`. When the value of this register is 0, go to step 4(d).

(d) Different message blocks will be generated, depending on whether the size of the to-be-processed message is a multiple of 512 bits.

- If the bit length of the message is a multiple of 512 bits, there are three possible options:
 - i. If Block $_{n+1}$ exists, write 1 to register `HMAC_SET_MESSAGE_ING_REG` to make $n = n + 1$, and then jump to step 4(b).
 - ii. If Block $_n$ is the last block of the message and the user wants to apply SHA padding in hardware, write 1 to register `HMAC_SET_MESSAGE_END_REG`, and then jump to step 6.

- iii. If Block_ n is the last block of the padded message and the user has applied SHA padding in software, write 1 to register `HMAC_SET_MESSAGE_PAD_REG`, and then jump to step 5.
- If the bit length of the message is not a multiple of 512 bits, there are three possible options as follows. Note that in this case, the user should apply SHA padding to the message, after which the padded message length should be a multiple of 512 bits.
 - i. If Block_ n is the only message block, $n = 1$, and Block_ 1 has included all padding bits, write 1 to register `HMAC_ONE_BLOCK_REG`, and then jump to step 6.
 - ii. If Block_ n is the second to last padded block, write 1 to register `HMAC_SET_MESSAGE_PAD_REG`, and then jump to step 5.
 - iii. If Block_ n is neither the last nor the second to last message block, write 1 to register `HMAC_SET_MESSAGE_ING_REG` and define $n = n + 1$, and then jump to step 4.(b).
- 5. Apply SHA padding to message
 - (a) After applying SHA padding to the last message block as described in Section 19.3.1, write this block to register `HMAC_WDATA0~15_REG`, and then write 1 to register `HMAC_SET_MESSAGE_ONE_REG`. Then the HMAC module will calculate this message block.
 - (b) Jump to step 6.
- 6. Read hash result in upstream mode
 - (a) Poll Status register `HMAC_QUERY_BUSY_REG`. When the value of this register is 0, go to the next step.
 - (b) Read hash result from register `HMAC_RDATA0~7_REG`.
 - (c) Write 1 to register `HMAC_SET_RESULT_FINISH_REG` to finish calculation.
 - (d) Upstream mode operation is completed.

Note:

The SHA accelerator can be called directly, or used internally by the DS module and the HMAC module. However, they can not share the hardware resources simultaneously. Therefore, SHA module can not be called by the CPU nor DS module when the HMAC module is in use.

19.3 HMAC Algorithm Details

19.3.1 Padding Bits

The HMAC module uses SHA-256 as hash algorithm. If the input message is not a multiple of 512 bits, a SHA-256 padding algorithm must be applied in software. The SHA-256 padding algorithm is the same as described in Section *Padding the Message* of *FIPS PUB 180-4*.

As shown in Figure 19-1, suppose the length of the unpadded message is m bits. Padding steps are as follows:

1. Append one bit of value “1” to the end of the unpadded message;
2. Append k bits of value “0”, where k is the smallest non-negative number which satisfies $m + 1 + k \equiv 448 \pmod{512}$;

- Append a 64-bit integer value as a binary block. This block includes the length of the unpadded message as a big-endian binary integer value m .

Figure 19-1. HMAC SHA-256 Padding Diagram

In downstream mode, there is no need to input any message or apply padding. In upstream mode, if the length of the unpadded message is a multiple of 512 bits, the user can choose to configure hardware to apply the SHA padding. If the length is not a multiple of 512 bits, the user must apply the SHA padding manually. For detailed steps, please see Section 19.2.6.

19.3.2 HMAC Algorithm Structure

The structure of the implemented algorithm in the HMAC module is shown in Figure 19-2. This is the standard HMAC algorithm as described in RFC 2104.

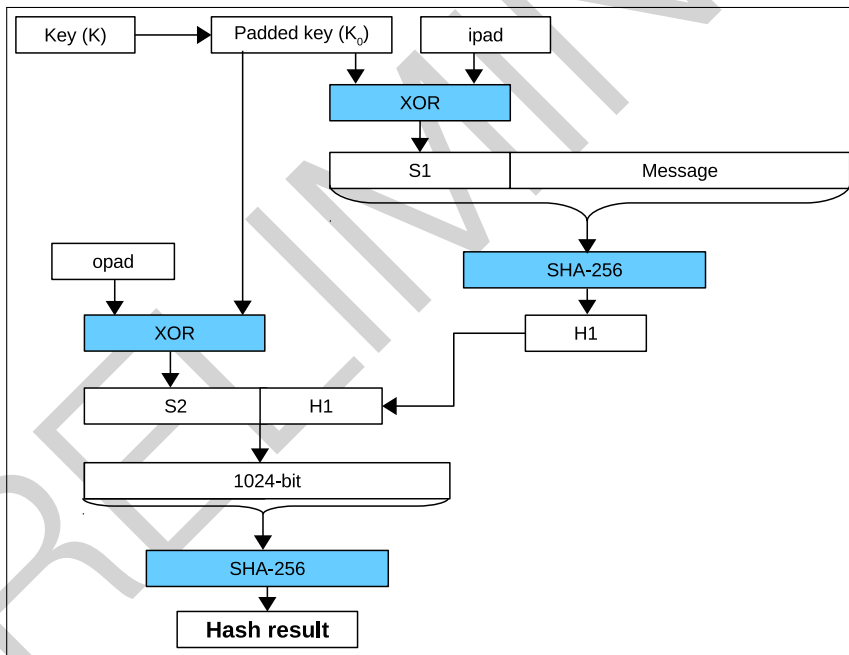

Figure 19-2. HMAC Structure Schematic Diagram

In Figure 19-2:

1. ipad is a 512-bit message block composed of 64 bytes of 0x36.
2. opad is a 512-bit message block composed of 64 bytes of 0x5c.

The HMAC module appends a 256-bit 0 sequence after the bit sequence of the 256-bit key K in order to get a 512-bit K_0 . Then, the HMAC module XORs K_0 with ipad to get the 512-bit S_1 . Afterwards, the HMAC module appends the input message (multiple of 512 bits) after the 512-bit S_1 , and exercises the SHA-256 algorithm to get the 256-bit H_1 .

The HMAC module appends the 256-bit SHA-256 hash result H_1 to the 512-bit S_2 value, which is calculated using the XOR operation of K_0 and opad. A 768-bit sequence will be generated. Then, the HMAC module uses the SHA padding algorithm described in Section 19.3.1 to pad the 768-bit sequence to a 1024-bit sequence, and applies the SHA-256 algorithm to get the final hash result (256-bit).

19.4 Register Summary

The addresses in this section are relative to HMAC Accelerator base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
Status/Control Register			
HMAC_SET_START_REG	HMAC start control register	0x040	WO
HMAC_SET_PARA_PURPOSE_REG	HMAC parameter purpose register	0x044	WO
HMAC_SET_PARA_KEY_REG	HMAC parameter key register	0x048	WO
HMAC_SET_PARA_FINISH_REG	Finish initial configuration	0x04C	WO
HMAC_SET_MESSAGE_ONE_REG	HMAC message control register	0x050	WO
HMAC_SET_MESSAGE_ING_REG	HMAC message continue register	0x054	WO
HMAC_SET_MESSAGE_END_REG	HMAC message end register	0x058	WO
HMAC_SET_RESULT_FINISH_REG	HMAC result reading finish register	0x05C	WO
HMAC_SET_INVALIDATE_JTAG_REG	Invalidate JTAG result register	0x060	WO
HMAC_SET_INVALIDATE_DS_REG	Invalidate digital signature result register	0x064	WO
HMAC_QUERY_ERROR_REG	Stores matching results between keys generated by users and corresponding purposes	0x068	RO
HMAC_QUERY_BUSY_REG	Busy state of HMAC module	0x06C	RO
HMAC Message Block			
HMAC_WR_MESSAGE_0_REG	Message register 0	0x080	WO
HMAC_WR_MESSAGE_1_REG	Message register 1	0x084	WO
HMAC_WR_MESSAGE_2_REG	Message register 2	0x088	WO
HMAC_WR_MESSAGE_3_REG	Message register 3	0x08C	WO
HMAC_WR_MESSAGE_4_REG	Message register 4	0x090	WO
HMAC_WR_MESSAGE_5_REG	Message register 5	0x094	WO
HMAC_WR_MESSAGE_6_REG	Message register 6	0x098	WO
HMAC_WR_MESSAGE_7_REG	Message register 7	0x09C	WO
HMAC_WR_MESSAGE_8_REG	Message register 8	0x0A0	WO
HMAC_WR_MESSAGE_9_REG	Message register 9	0x0A4	WO
HMAC_WR_MESSAGE_10_REG	Message register 10	0x0A8	WO
HMAC_WR_MESSAGE_11_REG	Message register 11	0x0AC	WO
HMAC_WR_MESSAGE_12_REG	Message register 12	0x0B0	WO
HMAC_WR_MESSAGE_13_REG	Message register 13	0x0B4	WO
HMAC_WR_MESSAGE_14_REG	Message register 14	0x0B8	WO
HMAC_WR_MESSAGE_15_REG	Message register 15	0x0BC	WO
HMAC Upstream Result			
HMAC_RD_RESULT_0_REG	Hash result register 0	0x0C0	RO
HMAC_RD_RESULT_1_REG	Hash result register 1	0x0C4	RO
HMAC_RD_RESULT_2_REG	Hash result register 2	0x0C8	RO
HMAC_RD_RESULT_3_REG	Hash result register 3	0x0CC	RO
HMAC_RD_RESULT_4_REG	Hash result register 4	0x0D0	RO
HMAC_RD_RESULT_5_REG	Hash result register 5	0x0D4	RO
HMAC_RD_RESULT_6_REG	Hash result register 6	0x0D8	RO

Name	Description	Address	Access
HMAC_RD_RESULT_7_REG	Hash result register 7	0x0DC	RO
configuration Register			
HMAC_SET_MESSAGE_PAD_REG	Software padding register	0x0F0	WO
HMAC_ONE_BLOCK_REG	One block message register	0x0F4	WO
HMAC_SOFT_JTAG_CTRL_REG	Re-enable JTAG register 0	0x0F8	WO
HMAC_WR_JTAG_REG	Re-enable JTAG register 1	0x0FC	WO
Version Register			
HMAC_DATE_REG	Version control register	0x1FC	R/W

19.5 Registers

The addresses in this section are relative to HMAC Accelerator base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 19.1. HMAC_SET_START_REG (0x040)

HMAC_SET_START Set this bit to start hmac operation. (WO)

Register 19.2. HMAC_SET_PARA_PURPOSE_REG (0x044)

HMAC_PURPOSE_SET Set HMAC parameter purpose, please see Table 19-1. (WO)

Register 19.3. HMAC_SET_PARA_KEY_REG (0x048)

HMAC_KEY_SET Set HMAC parameter key. There are six keys with index 0 ~ 5. Write the index of the selected key to this field. (WO)

Register 19.7. HMAC_SET_MESSAGE_END_REG (0x058)

HMAC_SET_TEXT_END Set this bit to start hardware padding. (WO)

Register 19.8. HMAC_SET_RESULT_FINISH_REG (0x05C)

HMAC_SET_RESULT_END After read result from upstream, then let HMAC back to idle. (WO)

Register 19.9. HMAC_SET_INVALIDATE_JTAG_REG (0x060)

HMAC_SET_INVALIDATE_JTAG Set this bit to clear calculation results when re-enabling JTAG in downstream mode. (WO)

Register 19.10. HMAC_SET_INVALIDATE_DS_REG (0x064)

HMAC_SET_INVALIDATE_DS Set this bit to clear calculation results of the DS module in downstream mode. (WO)

Register 19.11. HMAC_QUERY_ERROR_REG (0x068)

HMAC_QUREY_CHECK Indicates whether a HMAC key matches the purpose.

- 0: HMAC key and purpose match.
- 1: error. (RO)

Register 19.12. HMAC_QUERY_BUSY_REG (0x06C)

HMAC_BUSY_STATE Indicates whether HMAC is in busy state.

- 1'b0: idle.
- 1'b1: HMAC is still working for calculation. (RO)

Register 19.13. HMAC_WR_MESSAGE_n_REG (n: 0-15) (0x080+4*n)

HMAC_WDATA_n Store the *n*th 32-bit of message. (WO)

Register 19.14. HMAC_RD_RESULT_n_REG (n: 0-7) (0x0C0+4*n)

HMAC_RDATA_n Read the *n*th 32-bit of hash result. (RO)

Register 19.15. HMAC_SET_MESSAGE_PAD_REG (0x0F0)

HMAC_SET_TEXT_PAD Set this bit to start software padding. (WO)

Register 19.16. HMAC_ONE_BLOCK_REG (0x0F4)

HMAC_SET_ONE_BLOCK Set this bit to show that no padding is required. (WO)

Register 19.17. HMAC_SOFT_JTAG_CTRL_REG (0x0F8)

HMAC_SOFT_JTAG_CTRL Set this bit to turn on JTAG verification. (WO)

Register 19.18. HMAC_WR_JTAG_REG (0x0FC)

HMAC_WR_JTAG 32-bit of key to be compared. (WO)

Register 19.19. HMAC_DATE_REG (0x1FC)

HMAC_DATE Version control register.(R/W)

20 Digital Signature (DS)

20.1 Overview

A Digital Signature is used to verify the authenticity and integrity of a message using a cryptographic algorithm. This can be used to validate a device's identity to a server, or to check the integrity of a message.

The ESP32-S3 includes a Digital Signature (DS) module providing hardware acceleration of messages' signatures based on RSA. It uses pre-encrypted parameters to calculate a signature. The parameters are encrypted using HMAC as a key-derivation function. In turn, the HMAC uses eFuses as an input key. The whole process happens in hardware so that neither the decryption key for the RSA parameters nor the input key for the HMAC key derivation function can be seen by the users while calculating the signature.

20.2 Features

- RSA Digital Signatures with key length up to 4096 bits
- Encrypted private key data, only decryptable by DS peripheral
- SHA-256 digest to protect private key data against tampering by an attacker

20.3 Functional Description

20.3.1 Overview

The DS peripheral calculates RSA signature as $Z = X^Y \bmod M$ where Z is the signature, X is the input message, Y and M are the RSA private key parameters.

Private key parameters are stored in flash or other memory as ciphertext. They are decrypted using a key (DS_KEY) which can only be read by the DS peripheral via the HMAC peripheral. The required inputs ($HMAC_KEY$) to generate the key are only stored in eFuse and can only be accessed by the HMAC peripheral. The DS peripheral hardware can decrypt the private key, and the private key in plaintext is never accessed by the software. For more detailed information about eFuse and HMAC peripherals, please refer to Chapter 4 [eFuse Controller](#) and 19 [HMAC Accelerator \(HMAC\)](#) peripheral.

The input message X will be sent directly to the DS peripheral by the software, each time a signature is needed. After the RSA signature operation, the signature Z is read back by the software.

For better understanding, we define some symbols and functions here, which are only applicable to this chapter:

- 1^s A bit string consist of s bits that stores "1".
- $[x]_s$ A bit string of s bits, in which s should be the integral multiple of 8 bits. If x is a number ($x < 2^s$), it is represented in little endian byte order in the bit string. x may be a variable value such as $[Y]_{4096}$ or as a hexadecimal constant such as $[0x0C]_8$. If necessary, the value $[x]_t$ can be right-padded with $(s - t)$ number of 0 to reach s bits in length, and finally get $[x]_s$. For example, $[0x05]_8 = 00000101$, $[0x05]_{16} = 0000010100000000$, $[0x0005]_{16} = 0000000000000101$, $[0x13]_8 = 00010011$, $[0x13]_{16} = 0001001100000000$, $[0x0013]_{16} = 0000000000010011$.
- $||$ A bit string concatenation operator for joining multiple bit strings into a longer bit string.

20.3.2 Private Key Operands

Private key operands Y (private key exponent) and M (key modulus) are generated by the user. They have a particular RSA key length (up to 4096 bits). Two additional private key operands are needed: \bar{r} and M' . These two operands are derived from Y and M .

Operands Y , M , \bar{r} and M' are encrypted by the user along with an authentication digest and stored as a single ciphertext C . C is inputted to the DS peripheral in this encrypted format, decrypted by the hardware, and then used for RSA signature calculation. Detailed description of how to generate C is provided in Section 20.3.3.

The DS peripheral supports RSA signature calculation $Z = X^Y \bmod M$, in which the length of operands should be $N = 32 \times x$ where $x \in \{1, 2, 3, \dots, 128\}$. The bit lengths of arguments Z , X , Y , M and \bar{r} should be an arbitrary value in N , and all of them in a calculation must be of the same length, while the bit length of M' should always be 32. For more detailed information about RSA calculation, please refer to Section 18.3.1 *Large Number Modular Exponentiation* in Chapter 18 *RSA Accelerator (RSA)*.

20.3.3 Software Prerequisites

The left side of Figure 20-1 lists preparations required by the software before the hardware starts RSA signature calculation, while the right side lists the hardware workflow during the entire calculation procedure.

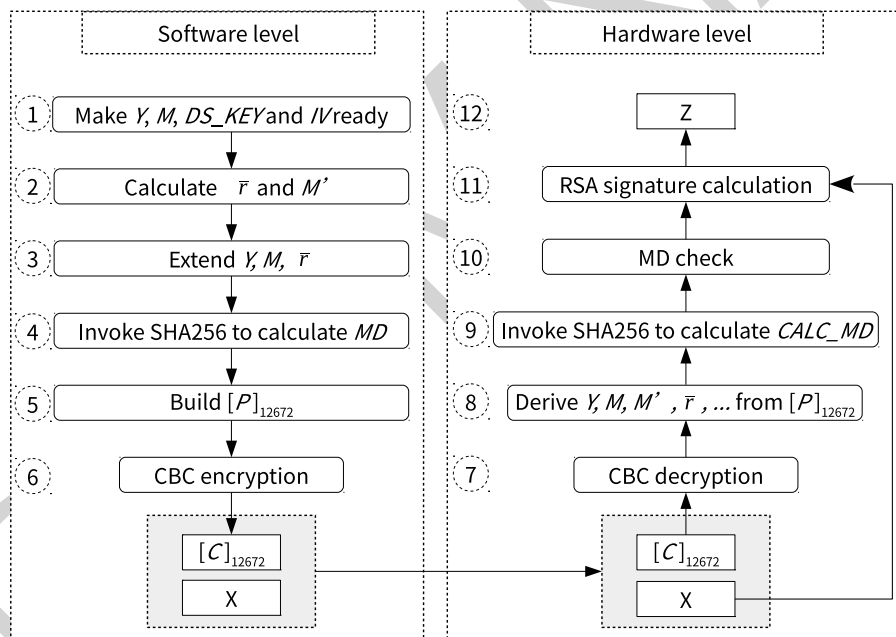

Figure 20-1. Software Preparations and Hardware Working Process

Note:

1. The software preparation (left side in the Figure 20-1) is a one-time operation before any signature is calculated, while the hardware calculation (right side in the Figure 1-1) repeats for every signature calculation.

Users need to follow the steps shown in the left part of Figure 20-1 to calculate C . Detailed instructions are as follows:

- **Step 1:** Prepare operands Y and M whose lengths should meet the requirements in Section 20.3.2.

Define $[L]_{32} = \frac{N}{32}$ (i.e., for RSA 4096, $[L]_{32} = [0x80]_{32}$). Prepare $[HMAC_KEY]_{256}$ and calculate $[DS_KEY]_{256}$ based on $DS_KEY = \text{HMAC-SHA256}([HMAC_KEY]_{256}, 1^{256})$. Generate a random $[IV]_{128}$ which should meet the requirements of the AES-CBC block encryption algorithm. For more information on AES, please refer to Chapter 17 *AES Accelerator (AES)*.

- **Step 2:** Calculate \bar{r} and M' based on M .
- **Step 3:** Extend Y , M and \bar{r} , in order to get $[Y]_{4096}$, $[M]_{4096}$ and $[\bar{r}]_{4096}$, respectively. This step is only required for Y , M and \bar{r} whose length are less than 4096 bits, since their largest length are 4096 bits.
- **Step 4** Calculate MD authentication code using the SHA-256:
 $[MD]_{256} = \text{SHA256}([Y]_{4096} || [M]_{4096} || [\bar{r}]_{4096} || [M']_{32} || [L]_{32} || [IV]_{128})$
- **Step 5:** Build $[P]_{12672} = ([Y]_{4096} || [M]_{4096} || [\bar{r}]_{4096} || [MD]_{256} || [M']_{32} || [L]_{32} || [\beta]_{64})$, where $[\beta]_{64}$ is a PKCS#7 padding value, i.e., a 64-bit string $[0x0808080808080808]_{64}$ composed of 8 bytes (value = 0x80). The purpose of $[\beta]_{64}$ is to make the bit length of P a multiple of 128.
- **Step 6:** Calculate $C = [C]_{12672} = \text{AES-CBC-ENC}([P]_{12672}, [DS_KEY]_{256}, [IV]_{128})$, where C is the ciphertext with length of 12672 bits.

20.3.4 DS Operation at the Hardware Level

The hardware operation is triggered each time a digital signature needs to be calculated. The inputs are the pre-generated private key ciphertext C , a unique message X , and IV .

The DS operation at the hardware level can be divided into the following three stages:

1. Decryption: Step 7 and 8 in Figure 20-1

The decryption process is the inverse of Step 6 in figure 20-1. The DS peripheral will call AES accelerator to decrypt C in CBC block mode and get the resulted plaintext. The decryption process can be represented by $P = \text{AES-CBC-DEC}(C, DS_KEY, IV)$, where IV (i.e., $[IV]_{128}$) is defined by users. $[DS_KEY]_{256}$ is provided by HMAC module, derived from $HMAC_KEY$ stored in eFuse. $[DS_KEY]_{256}$, as well as $[HMAC_KEY]_{256}$ are not readable by users.

With P , the DS peripheral can derive $[Y]_{4096}$, $[M]_{4096}$, $[\bar{r}]_{4096}$, $[M']_{32}$, $[L]_{32}$, MD authentication code, and the padding value $[\beta]_{64}$. This process is the inverse of Step 5.

2. Check: Step 9 and 10 in Figure 20-1

The DS peripheral will perform two checks: MD check and padding check. Padding check is not shown in Figure 20-1, as it happens at the same time with MD check.

- **MD check:** The DS peripheral calls SHA-256 to calculate the MD authentication code $[CALC_MD]_{256}$ from $[Y]_{4096} || [M]_{4096} || [\bar{r}]_{4096} || [M']_{32} || [L]_{32} || [IV]_{128}$. Then, $[CALC_MD]_{256}$ is compared against the pre-calculated MD authentication code $[MD]_{256}$ from step 4. Only when the two match, MD check passes.
- **Padding check:** The DS peripheral checks if $[\beta]_{64}$ complies with the aforementioned PKCS#7 format. Only when $[\beta]_{64}$ complies with the format, padding check passes.

The DS peripheral will only perform subsequent operations if MD check passes. If padding check fails, an error bit is set in the query register, but it does not affect the subsequent operations, i.e., it is up to the user to proceed or not.

3. Calculation: Step 11 and 12 in Figure 20-1

The DS peripheral treats X (input by users) and Y , M , \bar{r} (compiled) as big numbers. With M' , all operands to perform $X^Y \bmod M$ are in place. The operand length is defined by L . The DS peripheral will get the signed result Z by calling RSA to perform $Z = X^Y \bmod M$.

20.3.5 DS Operation at the Software Level

The following software steps should be followed each time a Digital Signature needs to be calculated. The inputs are the pre-generated private key ciphertext C , a unique message X , and IV . These software steps trigger the hardware steps described in Section 20.3.4.

We assume that the software has called the HMAC peripheral and HMAC on the hardware has calculated DS_KEY based on $HMAC_KEY$.

1. **Prerequisites:** Prepare operands C , X , IV according to Section 20.3.3.
2. **Activate the DS peripheral:** Write 1 to `DS_SET_START_REG`.
3. **Check if DS_KEY is ready:** Poll `DS_QUERY_BUSY_REG` until the software reads 0.

If the software does not read 0 in `DS_QUERY_BUSY_REG` after approximately 1 ms, it indicates a problem with HMAC initialization. In such a case, the software can read register `DS_QUERY_KEY_WRONG_REG` to get more information:

- If the software reads 0 in `DS_QUERY_KEY_WRONG_REG`, it indicates that the HMAC peripheral has not been activated.
 - If the software reads any value from 1 to 15 in `DS_QUERY_KEY_WRONG_REG`, it indicates that HMAC was activated, but the DS peripheral did not successfully receive the DS_KEY value from the HMAC peripheral. This may indicate that the HMAC operation has been interrupted due to a software concurrency problem.
4. **Configure register:** Write IV block to register `DS_IV_m_REG` (m : 0-3). For more information on the IV block, please refer to Chapter 17 *AES Accelerator (AES)*.
 5. **Write X to memory block `DS_X_MEM`:** Write X_i ($i \in \{0, 1, \dots, n - 1\}$), where $n = \frac{N}{32}$, to memory block `DS_X_MEM` whose capacity is 128 words. Each word can store one base- b digit. The memory block uses the little endian format for storage, i.e., the least significant digit of the operand is in the lowest address. Words in `DS_X_MEM` block after the configured length of X (N bits, as described in Section 20.3.2) are ignored.
 6. **Write C to memory block `DS_C_MEM`:** Write C_i ($i \in \{0, 1, \dots, 395\}$) to memory block `DS_C_MEM` whose capacity is 396 words. Each word can store one base- b digit.
 7. **Start DS operation:** Write 1 to register `DS_SET_ME_REG`.
 8. **Wait for the operation to be completed:** Poll register `DS_QUERY_BUSY_REG` until the software reads 0.
 9. **Query check result:** Read register `DS_QUERY_CHECK_REG` and determine the subsequent operations based on the return value.
 - If the value is 0, it indicates that both padding check and MD check pass. Users can continue to get the signed result Z .

- If the value is 1, it indicates that the padding check passes but MD check fails. The signed result Z is invalid. The operation will resume directly from Step 11.
 - If the value is 2, it indicates that the padding check fails but MD check passes. Users can continue to get the signed result Z . But please note that the data encapsulation format does not comply with the aforementioned PKCS#7 format, which may not be what you want.
 - If the value is 3, it indicates that both padding check and MD check fail. In this case, some fatal errors may occurred and the signed result Z is invalid. The operation will resume directly from Step 11.
10. **Read the signed result:** Read the signed result Z_i ($i \in \{0, 1, \dots, n - 1\}$), where $n = \frac{N}{32}$, from memory block `DS_Z_MEM`. The memory block stores Z in little-endian byte order.
 11. **Exit the operation:** Write 1 to `DS_SET_FINISH_REG`, then poll `DS_QUERY_BUSY_REG` until the software reads 0.

After the operation, all the input/output registers and memory blocks are cleared.

20.4 Memory Summary

The addresses in this section are relative to the [\[Digital Signature\]](#) base address provided in [Table 3-3](#) in [Chapter 3 System and Memory](#).

Name	Description	Size (byte)	Starting Address	Ending Address	Access
DS_C_MEM	Memory block C	1584	0x0000	0x062F	WO
DS_X_MEM	Memory block X	512	0x0800	0x09FF	WO
DS_Z_MEM	Memory block Z	512	0x0A00	0x0BFF	RO

20.5 Register Summary

The addresses in this section are relative to the Digital Signature base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
Configuration Registers			
DS_IV_0_REG	IV block data	0x0630	WO
DS_IV_1_REG	IV block data	0x0634	WO
DS_IV_2_REG	IV block data	0x0638	WO
DS_IV_3_REG	IV block data	0x063C	WO
Status/Control Registers			
DS_SET_START_REG	Activates the DS peripheral	0x0E00	WO
DS_SET_ME_REG	Starts DS operation	0x0E04	WO
DS_SET_FINISH_REG	Ends DS operation	0x0E08	WO
DS_QUERY_BUSY_REG	Status of the DS peripheral	0x0E0C	RO
DS_QUERY_KEY_WRONG_REG	Checks the reason why <i>DS_KEY</i> is not ready	0x0E10	RO
DS_QUERY_CHECK_REG	Queries DS check result	0x0814	RO
Version Register			
DS_DATE_REG	Version control register	0x0820	W/R

21 External Memory Encryption and Decryption (XTS_AES)

21.1 Overview

The ESP32-S3 integrates an External Memory Encryption and Decryption module that complies with the XTS_AES standard algorithm specified in [IEEE Std 1619-2007](#), providing security for users' application code and data stored in the external memory (flash and RAM). Users can store proprietary firmware and sensitive data (e.g., credentials for gaining access to a private network) to the external flash, or store general data to the external RAM.

21.2 Features

- General XTS_AES algorithm, compliant with IEEE Std 1619-2007
- Software-based manual encryption
- High-speed auto encryption, without software's participation
- High-speed auto decryption, without software's participation
- Encryption and decryption functions jointly determined by registers configuration, eFuse parameters, and boot mode

21.3 Module Structure

The External Memory Encryption and Decryption module consists of three blocks, namely the Manual Encryption block, Auto Encryption block, and Auto Decryption block. The module architecture is shown in Figure 21-1.

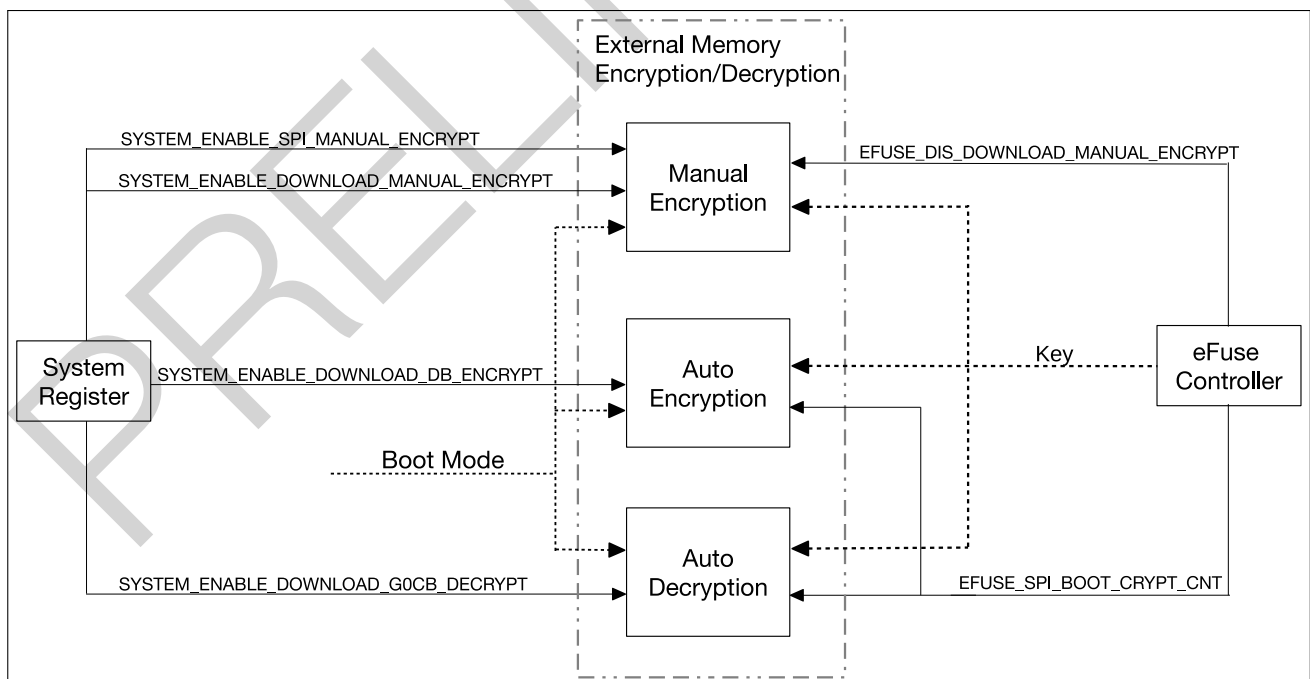

Figure 21-1. External Memory Encryption and Decryption Operation Settings

The Manual Encryption block can encrypt instructions/data which will then be written to the external flash as ciphertext via SPI1.

When the CPU writes data to the external RAM through cache, the Auto Encryption block will automatically encrypt the data first, then the data will be written to the external RAM as ciphertext.

When the CPU reads from the external flash or external RAM through cache, the Auto Decryption block will automatically decrypt the ciphertext to retrieve instructions and data.

In the System Registers (SYSREG) peripheral, the following four bits in register SYSTEM_EXTERNAL_DEVICE_ENCRYPT_DECRYPT_CONTROL_REG are relevant to the external memory encryption and decryption:

- SYSTEM_ENABLE_DOWNLOAD_MANUAL_ENCRYPT
- SYSTEM_ENABLE_DOWNLOAD_G0CB_DECRYPT
- SYSTEM_ENABLE_DOWNLOAD_DB_ENCRYPT
- SYSTEM_ENABLE_SPI_MANUAL_ENCRYPT

The XTS_AES module also fetches two parameters from the peripheral [4 eFuse Controller](#), which are: EFUSE_DIS_DOWNLOAD_MANUAL_ENCRYPT and EFUSE_SPI_BOOT_CRYPT_CNT.

21.4 Functional Description

21.4.1 XTS Algorithm

The manual encryption and auto encryption/decryption all use the same algorithm, i.e., XTS algorithm. During implementation, the XTS algorithm is characterized by a "data unit" of 1024 bits, which is defined in the Section *XTS-AES encryption procedure of XTS-AES Tweakable Block Cipher* Standard. For more information about XTS-AES algorithm, please refer to [IEEE Std 1619-2007](#).

21.4.2 Key

The Manual Encryption block, Auto Encryption block and Auto Decryption block share the same *Key* when implementing XTS algorithm. The *Key* is provided by the eFuse hardware and cannot be accessed by users.

The *Key* can be either 256-bit or 512-bit long. The value and length of the *Key* are determined by eFuse parameters. For easier description, now define:

- Block_A: the BLOCK in BLOCK4 ~ BLOCK9 whose key purpose is EFUSE_KEY_PURPOSE_XTS_AES_256_KEY_1. If Block_A is true, then the 256-bit *Key*_A is stored in it.
- Block_B: the BLOCK in BLOCK4 ~ BLOCK9 whose key purpose is EFUSE_KEY_PURPOSE_XTS_AES_256_KEY_2. If Block_B is true, then the 256-bit *Key*_B is stored in it.
- Block_C: the BLOCK in BLOCK4 ~ BLOCK9 whose key purpose is EFUSE_KEY_PURPOSE_XTS_AES_128_KEY. If Block_C is true, then the 256-bit *Key*_C is stored in it.

There are five possibilities of how the *Key* is generated depending on whether Block_A, Block_B and Block_C exists or not, as shown in Table 21-1. In each case, the *Key* can be uniquely determined by Block_A, Block_B or Block_C.

Table 21-1. Key generated based on Key_A , Key_B and Key_C

Block _A	Block _B	Block _C	Key	Key Length (bit)
Yes	Yes	Don't care	$Key_A Key_B$	512
Yes	No	Don't care	$Key_A 0^{256}$	512
No	Yes	Don't care	$0^{256} Key_B$	512
No	No	Yes	Key_C	256
No	No	No	0^{256}	256

Notes:

“YES” indicates that the block exists; “NO” indicates that the block does not exist; “0²⁵⁶” indicates a bit string that consists of 256-bit zeros; “||” is a bonding operator for joining one bit string to another.

For more information of key purposes, please refer to Table 4-2 *Secure Key Purpose Values* in Chapter 4 *eFuse Controller*.

21.4.3 Target Memory Space

The target memory space refers to a continuous address space in the external memory where the first encrypted ciphertext is stored. The target memory space can be uniquely determined by three relevant parameters: type, size and base address, whose definitions are listed below.

- Type: the *type* of the target memory space, either external flash or external RAM. Value 0 indicates external flash, while 1 indicates external RAM.
- Size: the *size* of the target memory space, indicating the number bytes encrypted in one encryption operation, which supports 16, 32 or 64 bytes.
- Base address: the *base_addr* of the target memory space. It is a 30-bit physical address, with range of 0x0000_0000 ~ 0x3FFF_FFFF. It should be aligned to *size*, i.e., $base_addr \% size == 0$.

For example, if there are 16 bytes of instruction data need to be encrypted and written to address 0x130 ~ 0x13F in the external flash, then the target space is 0x130 ~ 0x13F, type is 0 (external flash), size is 16 (bytes), and base address is 0x130.

The encryption of any length (must be multiples of 16 bytes) of plaintext instruction/data can be completed separately in multiple operations, and each operation has individual target memory space and the relevant parameters.

For Auto Encryption/Decryption blocks, these parameters are automatically defined by hardware. For Manual Encryption block, these parameters should be configured manually by users.

Note:

The “tweak” defined in Chapter 5.1 *Data units and tweaks* of [IEEE Std 1619-2007](#) is a 128-bit non-negative integer (*tweak*), which can be generated according to $tweak = type * 2^{30} + (base_addr \& 0x3FFFFFF80)$. The lowest 7 bits and the highest 97 bits in *tweak* are always zero.

21.4.4 Data Padding

For Auto Encryption/Decryption blocks, data padding is automatically completed by hardware. For Manual Encryption block, data padding should be completed manually by users. The Manual Encryption block has a

registers block which consists of 16 registers, i.e., XTS_AES_PLAIN_0_REG (n : 0-15), that are dedicated to data padding and can store up to 512 bits of plaintext instructions/data.

Actually, the Manual Encryption block does not care where the plaintext comes from, but only where the ciphertext will be stored. Because of the strict correspondence between plaintext and ciphertext, in order to better describe how the plaintext is stored in the register block, we assume that the plaintext is stored in the target memory space in the first place and replaced by ciphertext after encryption. Therefore, the following description no longer has the concept of “plaintext”, but uses “target memory space” instead. Please note that the plaintext can come from everywhere in actual use, but users should understand how the plaintext is stored in the register block.

How mapping works between target memory space and registers:

Assume a word in the target memory space is stored in *address*, define $offset = address \% 64$, $n = \frac{offset}{4}$, then the word will be stored in register XTS_AES_PLAIN_0_REG.

For example, if the *size* of the target memory space is 64, then all the 16 registers will be used for data storage. The mapping between *offset* and registers is shown in Table 21-2.

Table 21-2. Mapping Between Offsets and Registers

<i>offset</i>	Register	<i>offset</i>	Register
0x00	XTS_AES_PLAIN_0_REG	0x20	XTS_AES_PLAIN_8_REG
0x04	XTS_AES_PLAIN_1_REG	0x24	XTS_AES_PLAIN_9_REG
0x08	XTS_AES_PLAIN_2_REG	0x28	XTS_AES_PLAIN_10_REG
0x0C	XTS_AES_PLAIN_3_REG	0x2C	XTS_AES_PLAIN_11_REG
0x10	XTS_AES_PLAIN_4_REG	0x30	XTS_AES_PLAIN_12_REG
0x14	XTS_AES_PLAIN_5_REG	0x34	XTS_AES_PLAIN_13_REG
0x18	XTS_AES_PLAIN_6_REG	0x38	XTS_AES_PLAIN_14_REG
0x1C	XTS_AES_PLAIN_7_REG	0x3C	XTS_AES_PLAIN_15_REG

21.4.5 Manual Encryption Block

The Manual Encryption block is a peripheral module. It is equipped with registers and can be accessed by the CPU directly. Registers embedded in this block, the System Registers (SYSREG) peripheral, eFuse parameters, and boot mode jointly configure and use this module. Please note that the Manual Encryption block can only encrypt for storage in the external flash.

The Manual Encryption block is operational only under certain conditions. The operating conditions are:

- In SPI Boot mode

If bit SYSTEM_ENABLE_SPI_MANUAL_ENCRYPT in register SYSTEM_EXTERNAL_DEVICE_ENCRYPT_DECRYPT_CONTROL_REG is 1, the Manual Encryption block can be enabled. Otherwise, it is not operational.

- In Download Boot mode

If bit SYSTEM_ENABLE_DOWNLOAD_MANUAL_ENCRYPT in register SYSTEM_EXTERNAL_DEVICE_ENCRYPT_DECRYPT_CONTROL_REG is 1 and the eFuse parameter

EFUSE_DIS_DOWNLOAD_MANUAL_ENCRYPT is 0, the Manual Encryption block can be enabled. Otherwise, it is not operational.

Note:

- Even though the CPU can skip cache and get the encrypted instruction/data directly by reading the external memory, users can by no means access *Key*.

21.4.6 Auto Encryption Block

The Auto Encryption block is not a conventional peripheral, so it does not have any registers and cannot be accessed by the CPU directly. The System Registers (SYSREG) peripheral, eFuse parameters, and boot mode jointly configure and use this block.

The Auto Encryption block is operational only under certain conditions. The operating conditions are:

- In SPI Boot mode

If the first bit or the third bit in parameter SPI_BOOT_CRYPT_CNT (3 bits) is set to 1, then the Auto Encryption block can be enabled. Otherwise, it is not operational.

- In Download Boot mode

If bit SYSTEM_ENABLE_DOWNLOAD_DB_ENCRYPT in register SYSTEM_EXTERNAL_DEVICE_ENCRYPT_DECRYPT_CONTROL_REG is 1, the Auto Encryption block can be enabled. Otherwise, it is not operational.

Note:

- When the Auto Encryption block is enabled, it will automatically encrypt data if the CPU writes data to the external RAM, and then the encrypted ciphertext will be written to the external RAM. The entire encryption process does not need software participation and is transparent to the cache. Users can by no means obtain the encryption *Key* during the process.
- When the Auto Encryption block is disabled, it will ignore the CPU's access request to cache and do not process the data. Therefore, the data will be written to the external RAM as plaintext directly.

21.4.7 Auto Decryption Block

The Auto Decryption block is not a conventional peripheral, so it does not have any registers and cannot be accessed by the CPU directly. The System Registers (SYSREG) peripheral, eFuse parameters, and boot mode jointly configure and use this block.

The Auto Decryption block is operational only under certain conditions. The operating conditions are:

- In SPI Boot mode

If the first bit or the third bit in parameter SPI_BOOT_CRYPT_CNT (3 bits) is set to 1, then the Auto Decryption block can be enabled. Otherwise, it is not operational.

- In Download Boot mode

If bit SYSTEM_ENABLE_DOWNLOAD_G0CB_DECRYPT in register SYSTEM_EXTERNAL_DEVICE_ENCRYPT_DECRYPT_CONTROL_REG is 1, the Auto Decryption block

can be enabled. Otherwise, it is not operational.

Note:

- When the Auto Decryption block is enabled, it will automatically decrypt the ciphertext if the CPU reads instructions/data from the external memory via cache to retrieve the instructions/data. The entire decryption process does not need software participation and is transparent to the cache. Users can by no means obtain the decryption *Key* during the process.
- When the Auto Decryption block is disabled, it does not have any effect on the contents stored in the external memory, no matter they are encrypted or not. Therefore, what the CPU reads via cache is the original information stored in the external memory.

21.5 Software Process

When the Manual Encryption block operates, software needs to be involved in the process. The steps are as follows:

1. Configure XTS_AES:

- Set register `XTS_AES_DESTINATION_REG` to $type = 0$.
- Set register `XTS_AES_PHYSICAL_ADDRESS_REG` to $base_addr$.
- Set register `XTS_AES_LINESIZE_REG` to $\frac{size}{32}$.

For definitions of $type$, $base_addr$ and $size$, please refer to Section 21.4.3.

2. Pad plaintext data to the registers block `XTS_AES_PLAIN_n_REG` (n : 0-15). For detailed information, please refer to Section 21.4.4.

Please pad data to registers according to your actual needs, and the unused ones could be set to arbitrary values.

3. Wait for Manual Encrypt block to be idle. Poll register `XTS_AES_STATE_REG` until the software reads 0.

4. Trigger manual encryption by writing 1 to register `XTS_AES_TRIGGER_REG`.

5. Wait for the encryption process. Poll register `XTS_AES_STATE_REG` until the software reads 2.

Step 1 to 5 are the steps of encrypting plaintext instructions with the Manual Encryption block using the *Key*.

6. Grant the ciphertext access to SPI1. Write 1 to register `XTS_AES_RELEASE_REG` to grant SPI1 the access to the encrypted ciphertext. After this, the value of register `XTS_AES_STATE_REG` will become 3.

7. Call SPI1 to write the ciphertext in the external flash (see Chapter 3 *SPI Controller (SPI)* [to be added later]).

8. Destroy the ciphertext. Write 1 to register `XTS_AES_DESTROY_REG`. After this, the value of register `XTS_AES_STATE_REG` will become 0.

Repeat above steps to meet plaintext instructions/data encryption demands.

21.6 Register Summary

The addresses in this section are relative to the External Memory Encryption and Decryption base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
Plaintext Register Heap			
XTS_AES_PLAIN_0_REG	Plaintext register 0	0x0000	R/W
XTS_AES_PLAIN_1_REG	Plaintext register 1	0x0004	R/W
XTS_AES_PLAIN_2_REG	Plaintext register 2	0x0008	R/W
XTS_AES_PLAIN_3_REG	Plaintext register 3	0x000C	R/W
XTS_AES_PLAIN_4_REG	Plaintext register 4	0x0010	R/W
XTS_AES_PLAIN_5_REG	Plaintext register 5	0x0014	R/W
XTS_AES_PLAIN_6_REG	Plaintext register 6	0x0018	R/W
XTS_AES_PLAIN_7_REG	Plaintext register 7	0x001C	R/W
XTS_AES_PLAIN_8_REG	Plaintext register 8	0x0020	R/W
XTS_AES_PLAIN_9_REG	Plaintext register 9	0x0024	R/W
XTS_AES_PLAIN_10_REG	Plaintext register 10	0x0028	R/W
XTS_AES_PLAIN_11_REG	Plaintext register 11	0x002C	R/W
XTS_AES_PLAIN_12_REG	Plaintext register 12	0x0030	R/W
XTS_AES_PLAIN_13_REG	Plaintext register 13	0x0034	R/W
XTS_AES_PLAIN_14_REG	Plaintext register 14	0x0038	R/W
XTS_AES_PLAIN_15_REG	Plaintext register 15	0x003C	R/W
Configuration Registers			
XTS_AES_LINESIZE_REG	Configures the size of target memory space	0x0040	R/W
XTS_AES_DESTINATION_REG	Configures the type of the external memory	0x0044	R/W
XTS_AES_PHYSICAL_ADDRESS_REG	Physical address	0x0048	R/W
Control/Status Registers			
XTS_AES_TRIGGER_REG	Activates AES algorithm	0x004C	WO
XTS_AES_RELEASE_REG	Release control	0x0050	WO
XTS_AES_DESTROY_REG	Destroys control	0x0054	WO
XTS_AES_STATE_REG	Status register	0x0058	RO
Version Register			
XTS_AES_DATE_REG	Version control register	0x005C	RO

21.7 Registers

The addresses in this section are relative to the External Memory Encryption and Decryption base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 21.1. XTS_AES_PLAIN_n_REG (n: 0-15) (0x0000+4*n)

XTS_AES_PLAIN_n Stores *n*th 32-bit piece of plain text. (R/W)

Register 21.2. XTS_AES_LINESIZE_REG (0x0040)

XTS_AES_LINESIZE Configures the data size of one encryption.

- 0: 16 bytes;
- 1: 32 bytes;
- 2: 64 bytes. (R/W)

Register 21.3. XTS_AES_DESTINATION_REG (0x0044)

XTS_AES_DESTINATION Configures the type of the external memory. Currently, it must be set to 0, as the Manual Encryption block only supports flash encryption. Errors may occur if users write 1. 0: flash; 1: external RAM. (R/W)

Register 21.4. XTS_AES_PHYSICAL_ADDRESS_REG (0x0048)

(reserved)		XTS_AES_PHYSICAL_ADDRESS	
31	30	29	0
0x0		0x00000000	
			Reset

XTS_AES_PHYSICAL_ADDRESS Physical address. (R/W)

Register 21.5. XTS_AES_TRIGGER_REG (0x004C)

(reserved)		XTS_AES_TRIGGER	
31			0
0x00000000		1	0
			Reset

XTS_AES_TRIGGER Write 1 to enable manual encryption. (WO)

Register 21.6. XTS_AES_RELEASE_REG (0x0050)

(reserved)		XTS_AES_RELEASE	
31			0
0x00000000		1	0
			Reset

XTS_AES_RELEASE Write 1 to grant SPI1 access to encrypted result. (WO)

Register 21.7. XTS_AES_DESTROY_REG (0x0054)

(reserved)		XTS_AES_DESTROY	
31			0
0x00000000		1	0
			Reset

XTS_AES_DESTROY Write 1 to destroy encrypted result. (WO)

Register 21.8. XTS_AES_STATE_REG (0x0058)

(reserved)		XTS_AES_STATE		
31	2	1	0	
0x00000000				0x0
				Reset

XTS_AES_STATE Indicates the status of the Manual Encryption block. (RO)

- 0x0 (XTS_AES_IDLE): idle;
- 0x1 (XTS_AES_BUSY): busy with encryption;
- 0x2 (XTS_AES_DONE): encryption is completed, but the encrypted result is not accessible to SPI;
- 0x3 (XTS_AES_RELEASE): encrypted result is accessible to SPI.

Register 21.9. XTS_AES_DATE_REG (0x005C)

(reserved)		XTS_AES_DATE		
31	30	29	0	
0	0	0x20200111		Reset

XTS_AES_DATE Version control register. (R/W)

22 Clock Glitch Detection

22.1 Overview

The Clock Glitch Detection module on ESP32-S3 detects glitches in external crystal XTAL_CLK signals, and generates a system reset signal (see Chapter 6 *Reset and Clock*) when detecting glitches to reset the whole digital circuit including RTC. By doing so, it prevents attackers from injecting glitches on external crystal XTAL_CLK clock to compromise ESP32-S3 and thus strengthens chip security.

22.2 Functional Description

22.2.1 Clock Glitch Detection

The Clock Glitch Detection module on ESP32-S3 monitors input clock signals from XTAL_CLK. If it detects a glitch, namely a clock pulse (a or b in the figure below) with a width shorter than 3 ns, input clock signals from XTAL_CLK are blocked.

Figure 22-1. XTAL_CLK Pulse Width

22.2.2 Reset

Once detecting a glitch on XTAL_CLK that affects the circuit's normal operation, the Clock Glitch Detection module triggers a system reset if `RTC_CNTL_GLITCH_RST_EN` bit is enabled. By default, this bit is set to enable a reset.

23 Random Number Generator (RNG)

23.1 Introduction

The ESP32-S3 contains a true random number generator, which generates 32-bit random numbers that can be used for cryptographical operations, among other things.

23.2 Features

The random number generator in ESP32-S3 generates true random numbers, which means random number generated from a physical process, rather than by means of an algorithm. No number generated within the specified range is more or less likely to appear than any other number.

23.3 Functional Description

Every 32-bit value that the system reads from the `RNG_DATA_REG` register of the random number generator is a true random number. These true random numbers are generated based on the thermal noise in the system and the asynchronous clock mismatch.

Thermal noise comes from the high-speed ADC or SAR ADC or both. Whenever the high-speed ADC or SAR ADC is enabled, bit streams will be generated and fed into the random number generator through an XOR logic gate as random seeds.

When the `RTC20M_CLK` clock is enabled for the digital core, the random number generator will also sample `RTC20M_CLK` (20 MHz) as a random bit seed. `RTC20M_CLK` is an asynchronous clock source and it increases the RNG entropy by introducing circuit metastability. However, to ensure maximum entropy, it's recommended to always enable an ADC source as well.

Figure 23-1. Noise Source

When there is noise coming from the SAR ADC, the random number generator is fed with a 2-bit entropy in one clock cycle of `RTC20M_CLK` (20 MHz), which is generated from an internal RC oscillator (see Chapter 6 *Reset and Clock* for details). Thus, it is advisable to read the `RNG_DATA_REG` register at a maximum rate of 500 kHz to obtain the maximum entropy.

When there is noise coming from the high-speed ADC, the random number generator is fed with a 2-bit entropy in one APB clock cycle, which is normally 80 MHz. Thus, it is advisable to read the `RNG_DATA_REG` register at a maximum rate of 5 MHz to obtain the maximum entropy.

23.4 Programming Procedure

When using the random number generator, make sure at least either the SAR ADC, high-speed ADC, or RTC20M_CLK is enabled. Otherwise, pseudo-random numbers will be returned.

- SAR ADC can be enabled by using the DIG ADC controller. For details, please refer to Chapter 4 *On-Chip Sensors and Analog Signal Processing [to be added later]*.
- High-speed ADC is enabled automatically when the Wi-Fi or Bluetooth modules is enabled.
- RTC20M_CLK is enabled by setting the `RTC_CNTL_DIG_CLK20M_EN` bit in the `RTC_CNTL_CLK_CONF_REG` register.

Note:

Note that, when the Wi-Fi module is enabled, the value read from the high-speed ADC can be saturated in some extreme cases, which lowers the entropy. Thus, it is advisable to also enable the SAR ADC as the noise source for the random number generator for such cases.

When using the random number generator, read the `RNG_DATA_REG` register multiple times until sufficient random numbers have been generated. Ensure the rate at which the register is read does not exceed the frequencies described in section 23.3 above.

23.5 Register Summary

The address in the following table is relative to the random number generator base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
<code>RNG_DATA_REG</code>	Random number data	0x0110	RO

23.6 Register

The address in this section is relative to the random number generator base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 23.1. `RNG_DATA_REG` (0x0110)

31	0
0x00000000	
Reset	

RNG_DATA Random number source. (RO)

24 UART Controller (UART)

24.1 Overview

In embedded system applications, data are required to be transferred in a simple way with minimal system resources. This can be achieved by a Universal Asynchronous Receiver/Transmitter (UART), which flexibly exchanges data with other peripheral devices in full-duplex mode. ESP32-S3 has three UART controllers compatible with various UART devices. They support Infrared Data Association (IrDA) and RS485 transmission.

Each of the three UART controllers has a group of registers that function identically. In this chapter, the three UART controllers are referred to as UART n , in which n denotes 0, 1, or 2.

A UART is a character-oriented data link for asynchronous communication between devices. Such communication does not provide any clock signal to send data. Therefore, in order to communicate successfully, the transmitter and the receiver must operate at the same baud rate with the same stop bit and parity bit.

A UART data frame usually begins with one start bit, followed by data bits, one parity bit (optional) and one or more stop bits. UART controllers on ESP32-S3 support various lengths of data bits and stop bits. These controllers also support software and hardware flow control as well as GDMA for seamless high-speed data transfer. This allows developers to use multiple UART ports at minimal software cost.

24.2 Features

Each UART controller has the following features:

- Three clock sources that can be divided
- Programmable baud rate
- 1024 x 8-bit RAM shared by TX FIFOs and RX FIFOs of the three UART controllers
- Full-duplex asynchronous communication
- Automatic baud rate detection of input signals
- Data bits ranging from 5 to 8
- Stop bits of 1, 1.5, 2 or 3 bits
- Parity bit
- Special character AT_CMD detection
- RS485 protocol
- IrDA protocol
- High-speed data communication using GDMA
- UART as wake-up source
- Software and hardware flow control

24.3 UART Structure

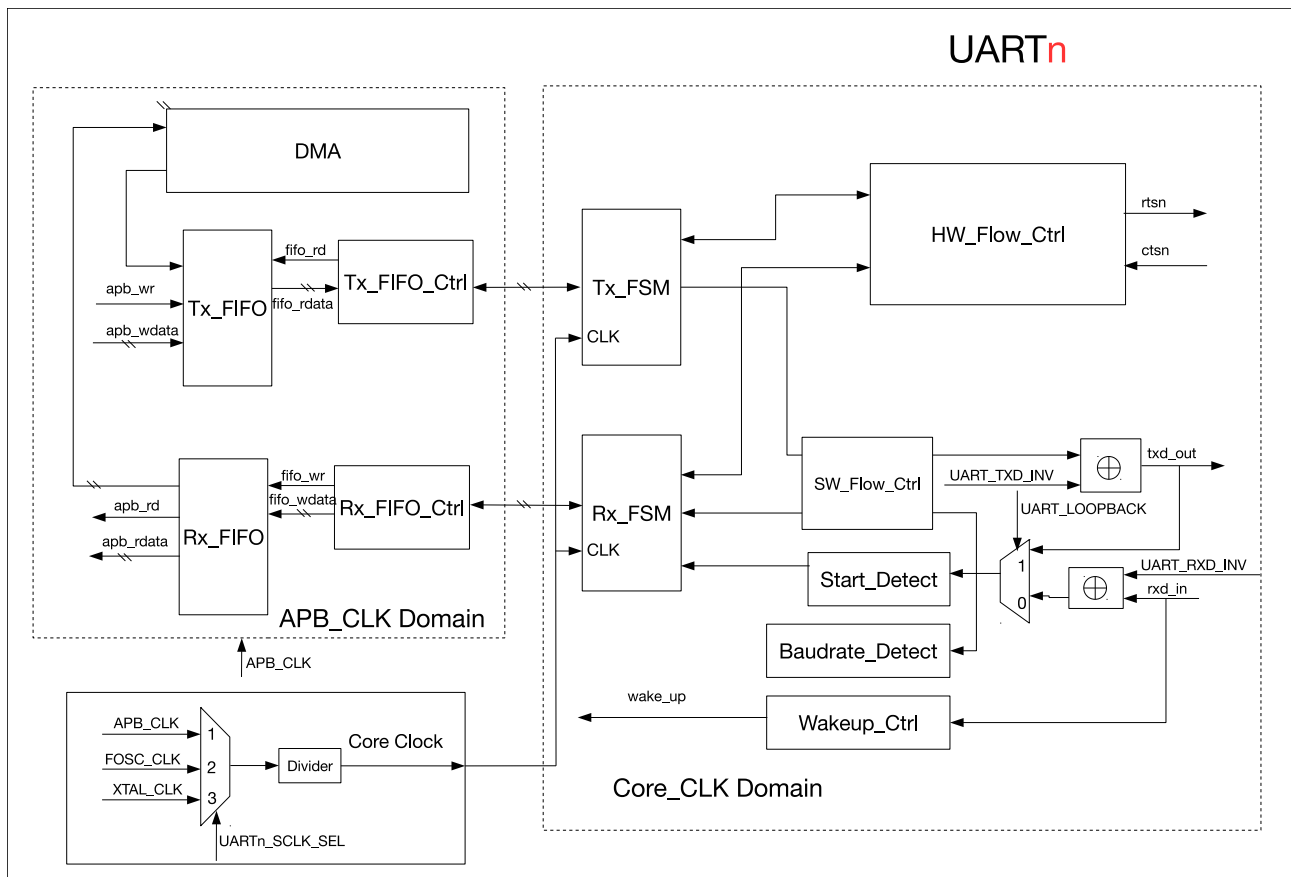

Figure 24-1. UART Structure

Figure 24-1 shows the basic structure of a UART controller. A UART controller works in two clock domains, namely APB_CLK domain and Core Clock domain (the UART Core's clock domain). The UART Core has three clock sources: 80 MHz APB_CLK, FOSC_CLK and external crystal clock XTAL_CLK (for details, please refer to Chapter 6 *Reset and Clock*), which are selected by configuring `UART_SCLCK_SEL`. The selected clock source is divided by a divider to generate clock signals that drive the UART Core.

A UART controller is broken down into two parts: a transmitter and a receiver.

The transmitter contains a FIFO, called TX FIFO (or Tx_FIFO), which buffers data to be sent. Software can write data to the Tx_FIFO either via the APB bus, or using GDMA. Tx_FIFO_Ctrl controls writing and reading the Tx_FIFO. When Tx_FIFO is not empty, Tx_FSM reads data bits in the data frame via Tx_FIFO_Ctrl, and converts them into a bitstream. The levels of output signal txd_out can be inverted by configuring `UART_TXD_INV` field.

The receiver also contains a FIFO, called RX FIFO (or Rx_FIFO), which buffers received data. The levels of input signal rxd_in can be inverted by configuring `UART_RXD_INV` field. Baudrate_Detect measures the baud rate of input signal rxd_in by detecting its minimum pulse width. Start_Detect detects the start bit in a data frame. If the start bit is detected, Rx_FSM stores data bits in the data frame into Rx_FIFO by Rx_FIFO_Ctrl. Software can read data from Rx_FIFO via the APB bus, or receive data using GDMA.

HW_Flow_Ctrl controls rxd_in and txd_out data flows by standard UART RTS and CTS flow control signals (rtsn_out and ctsn_in). SW_Flow_Ctrl controls data flows by automatically adding special characters to outgoing

data and detecting special characters in incoming data.

When a UART controller is in Light-sleep mode (see Chapter 5 *Low-Power Management (RTC_CNTL)* [to be added later] for more details), Wakeup_Ctrl counts up rising edges of rxd_in. When the number reaches `UART_ACTIVE_THRESHOLD + 2`, a wake_up signal is generated and sent to RTC, which then wakes up the ESP32-S3 chip.

24.4 Functional Description

24.4.1 Clock and Reset

UART controllers are asynchronous. their configuration registers, TX FIFOs, and RX FIFOs are in APB_CLK domain, while the module controlling transmission and reception (i.e. UART Core) is in Core Clock domain. The latter can be sourced out of three clocks, namely APB_CLK, FOSC_CLK and external crystal clock XTAL_CLK, which can be selected by configuring `UART_SCLK_SEL`. The selected clock source can be divided. This divider supports fractional division, and the divisor is equal to:

$$UART_SCLK_DIV_NUM + \frac{UART_SCLK_DIV_B}{UART_SCLK_DIV_A}$$

The divisor ranges from 1 ~ 256.

When the frequency of the UART Core's clock is higher than the frequency needed to generate baud rate, the UART Core can be clocked at a lower frequency by the divider, in order to reduce power consumption. Usually, the UART Core's clock frequency is lower than the APB_CLK's frequency, and can be divided by the largest divisor value when higher than the frequency needed to generate baud rate. The frequency of the UART Core's clock can also be at most twice higher than the APB_CLK. The clock for the UART transmitter and the UART receiver can be controlled independently. To enable the clock for the UART transmitter, `UART_TX_SCLK_EN` shall be set; to enable the clock for the UART receiver, `UART_RX_SCLK_EN` shall be set.

Section 24.5 explains the procedure to ensure that the configured register values are synchronized between APB_CLK domain and Core Clock domain.

Section 24.5.2.1 explains the procedure to reset the whole UART controller. Note that it is not recommended to only reset the APB clock domain module or UART Core.

24.4.2 UART RAM

Figure 24-2. UART Controllers Sharing RAM

All three UART controllers on ESP32-S3 share 1024×8 bits of RAM. As Figure 24-2 illustrates, the RAM is divided into 8 blocks, each has 128×8 bits. Figure 24-2 shows how many RAM blocks are allocated by default to TX and RX FIFOs for each of the three UART controllers. UART n Tx_FIFO can be expanded by configuring `UART_TX_SIZE`, while UART n Rx_FIFO can be expanded by configuring `UART_RX_SIZE`. Some limits are imposed:

- UART0 Tx_FIFO can be increased up to 8 blocks (the whole RAM);
- UART1 Tx_FIFO can be increased up to 7 blocks (from offset 128 to the end address);
- UART2 Tx_FIFO can be increased up to 6 blocks (from offset 256 to the end address);
- UART0 Rx_FIFO can be increased up to 4 blocks (from offset 512 to the end address);
- UART1 Rx_FIFO can be increased up to 3 blocks (from offset 640 to the end address);
- UART2 Rx_FIFO can be increased up to 2 blocks (from offset 768 to the end address).

Please note that starting addresses of all FIFOs are fixed, so expanding one FIFO may take up the default space of other FIFOs. For example, by setting `UART_TX_SIZE` of UART0 to 2, the size of UART0 Tx_FIFO is increased by 128 bytes (from offset 0 to offset 255). In this case, UART0 Tx_FIFO takes up the default space for UART1 Tx_FIFO, and UART1's transmitting function cannot be used as a result.

When neither of the three UART controllers is active, RAM can enter low-power mode by setting `UART_MEM_FORCE_PD`.

UART n Tx_FIFO is reset by setting `UART_TXFIFO_RST`. UART n Rx_FIFO is reset by setting `UART_RXFIFO_RST`.

The "empty" signal threshold for Tx_FIFO is configured by setting `UART_TXFIFO_EMPTY_THRHD`. When data stored in Tx_FIFO is less than `UART_TXFIFO_EMPTY_THRHD`, a `UART_TXFIFO_EMPTY_INT` interrupt is generated. The "full" signal threshold for Rx_FIFO is configured by setting `UART_RXFIFO_FULL_THRHD`. When data stored in Rx_FIFO is equal to or greater than `UART_RXFIFO_FULL_THRHD`, a `UART_RXFIFO_FULL_INT`

interrupt is generated. In addition, when Rx_FIFO receives more data than its capacity, a UART_RXFIFO_OVF_INT interrupt is generated.

TX FIFO and RX FIFO can be accessed via the APB bus or GDMA. Access via the APB bus is performed through register `UART_FIFO_REG`. You can put data into TX FIFO by writing `UART_RXFIFO_RD_BYTE`, and get data in RX FIFO by reading this exact same field. For access via GDMA, please refer to Section 24.4.10.

24.4.3 Baud Rate Generation and Detection

24.4.3.1 Baud Rate Generation

Before a UART controller sends or receives data, the baud rate should be configured by setting corresponding registers. The baud rate generator of a UART controller functions by dividing the input clock source. It can divide the clock source by a fractional amount. The divisor is configured by `UART_CLKDIV_REG`: `UART_CLKDIV` for the integer part, and `UART_CLKDIV_FRAG` for the fractional part. When using the 80 MHz input clock, the UART controller supports a maximum baud rate of 5 Mbaud.

The divisor of the baud rate is equal to

$$UART_CLKDIV + \frac{UART_CLKDIV_FRAG}{16}$$

meaning that the final baud rate is equal to

$$\frac{INPUT_FREQ}{UART_CLKDIV + \frac{UART_CLKDIV_FRAG}{16}}$$

where `INPUT_FREQ` is the frequency of UART Core's source clock. For example, if `UART_CLKDIV` = 694 and `UART_CLKDIV_FRAG` = 7 then the divisor value is

$$694 + \frac{7}{16} = 694.4375$$

When `UART_CLKDIV_FRAG` is 0, the baud rate generator is an integer clock divider where an output pulse is generated every `UART_CLKDIV` input pulses.

When `UART_CLKDIV_FRAG` is not 0, the divider is fractional and the output baud rate clock pulses are not strictly uniform. As shown in Figure 24-3, for every 16 output pulses, the frequency of some pulses is $INPUT_FREQ / (UART_CLKDIV + 1)$, and the frequency of the other pulses is $INPUT_FREQ / UART_CLKDIV$. A total of `UART_CLKDIV_FRAG` output pulses are generated by dividing $(UART_CLKDIV + 1)$ input pulses, and the remaining $(16 - UART_CLKDIV_FRAG)$ output pulses are generated by dividing `UART_CLKDIV` input pulses.

The output pulses are interleaved as shown in Figure 24-3 below, to make the output timing more uniform:

Figure 24-3. UART Controllers Division

To support IrDA (see Section 24.4.6 for details), the fractional clock divider for IrDA data transmission generates clock signals divided by $16 \times \text{UART_CLKDIV_REG}$. This divider works similarly as the one elaborated above: it takes $\text{UART_CLKDIV}/16$ as the integer value and the lowest four bits of UART_CLKDIV as the fractional value.

24.4.3.2 Baud Rate Detection

Automatic baud rate detection (Autobaud) on UARTs is enabled by setting `UART_AUTOBAUD_EN`. The Baudrate_Detect module shown in Figure 24-1 filters any noise whose pulse width is shorter than `UART_GLITCH_FILT`.

Before communication starts, the transmitter can send random data to the receiver for baud rate detection. `UART_LOWPULSE_MIN_CNT` stores the minimum low pulse width, `UART_HIGHPULSE_MIN_CNT` stores the minimum high pulse width, `UART_POSEDGE_MIN_CNT` stores the minimum pulse width between two rising edges, and `UART_NEGEDGE_MIN_CNT` stores the minimum pulse width between two falling edges. These four fields are read by software to determine the transmitter's baud rate.

Figure 24-4. The Timing Diagram of Weak UART Signals Along Falling Edges

Baud rate can be determined in the following three ways:

1. Normally, to avoid sampling erroneous data along rising or falling edges in metastable state, which results in inaccuracy of `UART_LOWPULSE_MIN_CNT` or `UART_HIGHPULSE_MIN_CNT`, use a weighted average of these two values to eliminate errors. In this case, baud rate is calculated as follows:

$$B_{\text{uart}} = \frac{f_{\text{clk}}}{(\text{UART_LOWPULSE_MIN_CNT} + \text{UART_HIGHPULSE_MIN_CNT} + 2)/2}$$

2. If UART signals are weak along falling edges as shown in Figure 24-4, which leads to inaccurate average of `UART_LOWPULSE_MIN_CNT` and `UART_HIGHPULSE_MIN_CNT`, use `UART_POSEDGE_MIN_CNT` to determine the transmitter's baud rate as follows:

$$B_{\text{uart}} = \frac{f_{\text{clk}}}{(\text{UART_POSEDGE_MIN_CNT} + 1)/2}$$

3. If UART signals are weak along rising edges, use `UART_NEGEDGE_MIN_CNT` to determine the transmitter's baud rate as follows:

$$B_{\text{uart}} = \frac{f_{\text{clk}}}{(\text{UART_NEGEDGE_MIN_CNT} + 1)/2}$$

24.4.4 UART Data Frame

Figure 24-5. Structure of UART Data Frame

Figure 24-5 shows the basic structure of a data frame. A frame starts with one START bit, and ends with STOP bits which can be 1, 1.5, 2 or 3 bits long, configured by `UART_STOP_BIT_NUM`, `UART_DL1_EN` and `UART_DLO_EN`. The START bit is logical low, whereas STOP bits are logical high.

The actual data length can be anywhere between 5 ~ 8 bits, configured by `UART_BIT_NUM`. When `UART_PARITY_EN` is set, a parity bit is added after data bits. `UART_PARITY` is used to choose even parity or odd parity. When the receiver detects a parity bit error in data received, a `UART_PARITY_ERR_INT` interrupt is generated, and the erroneous data are still stored into the RX FIFO. When the receiver detects a data frame error, a `UART_FRM_ERR_INT` interrupt is generated, and the erroneous data by default is stored into the RX FIFO.

If all data in `Tx_FIFO` have been sent, a `UART_TX_DONE_INT` interrupt is generated. After this, if the `UART_TXD_BRK` bit is set then the transmitter will send several low level bits, namely delimiters, to separate data packets. The number of low level bits is configured by `UART_TX_BRK_NUM`. Once the transmitter has sent all delimiters, a `UART_TX_BRK_DONE_INT` interrupt is generated. The minimum interval between data frames can be configured using `UART_TX_IDLE_NUM`. If the transmitter stays idle for `UART_TX_IDLE_NUM` or more time (in the unit of bit time, i.e. the time it takes to transfer one bit), a `UART_TX_BRK_IDLE_DONE_INT` interrupt is generated.

Figure 24-6. AT_CMD Character Structure

Figure 24-6 is the structure of a special character `AT_CMD`. If the receiver constantly receives `AT_CMD_CHAR` and the following conditions are met, a `UART_AT_CMD_CHAR_DET_INT` interrupt is generated. The specific value of `AT_CMD_CHAR` can be read from `UARTn_AT_CMD_CHAR`.

- The interval between the first `AT_CMD_CHAR` and the last non-`AT_CMD_CHAR` character is at least `UART_PRE_IDLE_NUM` cycles.
- The interval between two `AT_CMD_CHAR` characters is less than `UART_RX_GAP_TOUT` cycles.
- The number of `AT_CMD_CHAR` characters is equal to or greater than `UART_CHAR_NUM`.

- The interval between the last AT_CMD_CHAR character and next non-AT_CMD_CHAR character is at least `UART_POST_IDLE_NUM` cycles.

24.4.5 RS485

All three UART controllers support RS485 protocol. This protocol uses differential signals to transmit data, so it can communicate over longer distances at higher bit rates than RS232. RS485 has two-wire half-duplex mode and four-wire full-duplex modes. UART controllers support two-wire half-duplex transmission and bus snooping. In a two-wire RS485 multidrop network, there can be 32 slaves at most.

24.4.5.1 Driver Control

As shown in Figure 24-7, in a two-wire multidrop network, an external RS485 transceiver is needed for differential to single-ended conversion. A RS485 transceiver contains a driver and a receiver. When a UART controller is not in transmitter mode, the connection to the differential line can be broken by disabling the driver. When the DE (Driver Enable) signal is 1, the driver is enabled; when DE is 0, the driver is disabled.

The UART receiver converts differential signals to single-ended signals via an external receiver. RE is the enable control signal for the receiver. When RE is 0, the receiver is enabled; when RE is 1, the receiver is disabled. If RE is configured as 0, the UART controller is allowed to snoop data on the bus, including data sent by itself.

DE can be controlled by either software or hardware. To reduce the cost of software, DE is controlled by hardware in our design. As shown in Figure 24-7, DE is connected to `dtrn_out` of UART (please refer to Section 24.4.9.1 for more details).

Figure 24-7. Driver Control Diagram in RS485 Mode

24.4.5.2 Turnaround Delay

By default, all three UART controllers work in receiver mode. When a UART controller is switched from transmitter mode to receiver mode, the RS485 protocol requires a turnaround delay of one cycle after the stop bit. The UART transmitter supports adding a turnaround delay of one cycle not only before the start bit but also after the stop bit. When `UART_DL0_EN` is set, a turnaround delay of one cycle is added before the start bit; when `UART_DL1_EN` is set, a turnaround delay of one cycle is added after the stop bit.

24.4.5.3 Bus Snooping

In a two-wire multidrop network, UART controllers support bus snooping if RE of the external RS485 transceiver is 0. By default, a UART controller is not allowed to transmit and receive data simultaneously. If `UART_RS485TX_RX_EN` is set and the external RS485 transceiver is configured as in Figure 24-7, a UART

controller may receive data in transmitter mode and snoop the bus. If `UART_RS485RXBY_TX_EN` is set, a UART controller may transmit data in receiver mode.

All three UART controllers can snoop data sent by themselves. In transmitter mode, when a UART controller monitors a collision between data sent and data received, a `UART_RS485_CLASH_INT` interrupt is generated; when it monitors a data frame error, a `UART_RS485_FRM_ERR_INT` interrupt is generated; when it monitors a polarity error, a `UART_RS485_PARITY_ERR_INT` is generated.

24.4.6 IrDA

IrDA protocol consists of three layers, namely the physical layer, the link access protocol, and the link management protocol. The three UART controllers implement IrDA's physical layer. In IrDA encoding, a UART controller supports data rates up to 115.2 kbit/s (SIR, or serial infrared mode). As shown in Figure 24-8, the IrDA encoder converts a NRZ (non-return to zero code) signal to a RZI (return to zero code) signal and sends it to the external driver and infrared LED. This encoder uses modulated signals whose pulse width is $3/16$ bits to indicate logic "0", and low levels to indicate logic "1". The IrDA decoder receives signals from the infrared receiver and converts them to NRZ signals. In most cases, the receiver is high when it is idle, and the encoder output polarity is the opposite of the decoder input polarity. If a low pulse is detected, it indicates that a start bit has been received.

When IrDA function is enabled, one bit is divided into 16 clock cycles. If the bit to be sent is zero, then the 9th, 10th and 11th clock cycle are high.

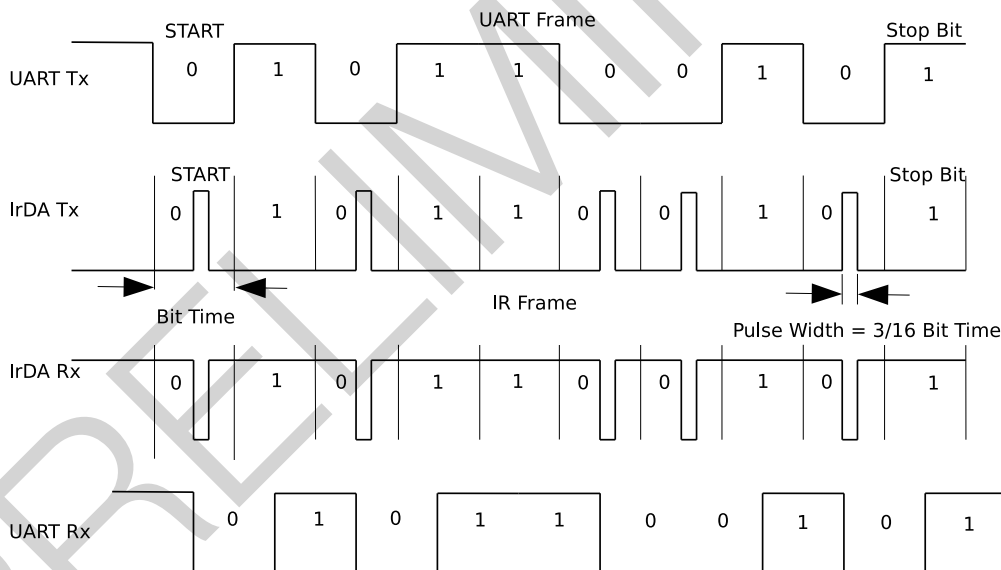

Figure 24-8. The Timing Diagram of Encoding and Decoding in SIR mode

The IrDA transceiver is half-duplex, meaning that it cannot send and receive data simultaneously. As shown in Figure 24-9, IrDA function is enabled by setting `UART_IRDA_EN`. When `UART_IRDA_TX_EN` is set (high), the IrDA transceiver is enabled to send data and not allowed to receive data; when `UART_IRDA_TX_EN` is reset (low), the IrDA transceiver is enabled to receive data and not allowed to send data.

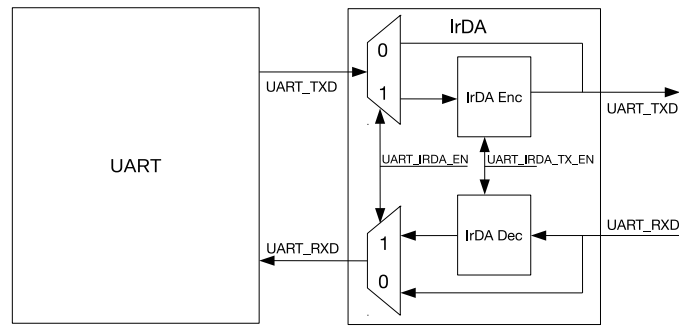

Figure 24-9. IrDA Encoding and Decoding Diagram

24.4.7 Wake-up

UART0 and UART1 can be set as a wake-up source for Light-sleep mode. To be specific Wakeup_Ctrl counts up the rising edges of rxd_in, and when this count becomes greater than `UART_ACTIVE_THRESHOLD + 2`, a wake_up signal is generated and sent to RTC, which then wakes ESP32-S3 up.

24.4.8 Loopback Test

UART n supports loopback testing, which can be enabled by setting `UART_LOOPBACK`. When loopback testing is enabled, UART output signal txd_out is connected to its input signal rxd_in, rtsn_out is connected to ctsn_in, and dtrn_out is connected to dsrn_out. Data are then sent out through txd_out. If the data received match the data sent, it indicates that UART n controller is working properly.

24.4.9 Flow Control

UART controllers have two ways to control data flow, namely hardware flow control and software flow control. Hardware flow control is achieved using output signal rtsn_out and input signal dsrn_in. Software flow control is achieved by inserting special characters (XON or XOFF) in data flow sent and detecting special characters in data flow received.

24.4.9.1 Hardware Flow Control

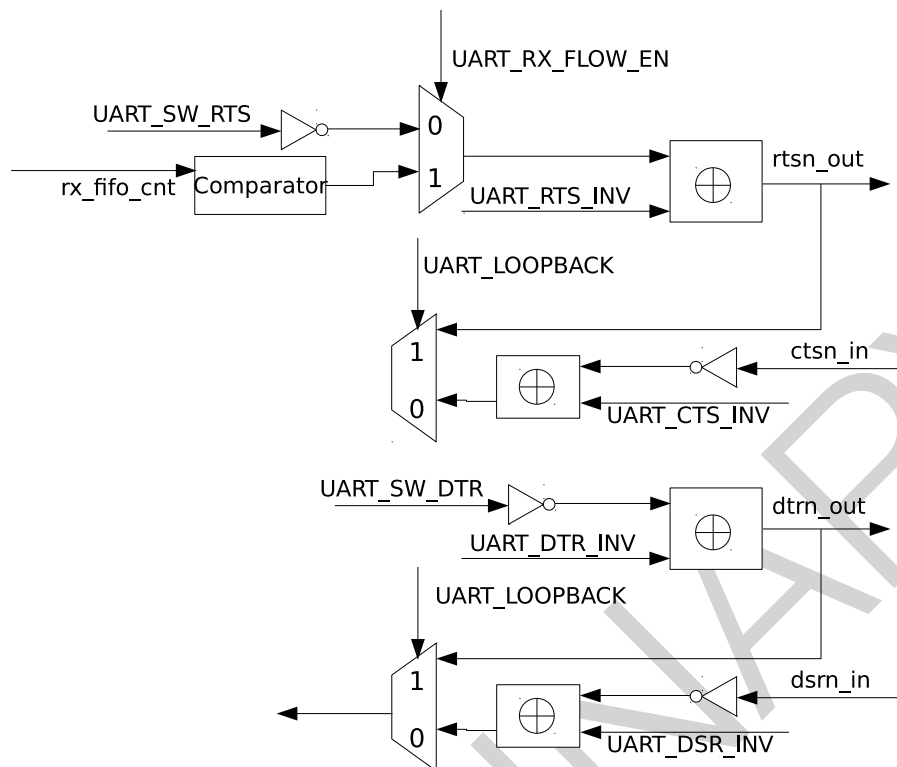

Figure 24-10. Hardware Flow Control Diagram

Figure 24-10 shows hardware flow control of a UART controller. Hardware flow control uses output signal `rtsn_out` and input signal `dsmn_in`. Figure 24-11 illustrates how these signals are connected between UART on ESP32-S3 (hereinafter referred to as IU0) and the external UART (hereinafter referred to as EU0).

When `rtsn_out` of IU0 is low, EU0 is allowed to send data; when `rtsn_out` of IU0 is high, EU0 is notified to stop sending data until `rtsn_out` of IU0 returns to low. The output signal `rtsn_out` can be controlled in two ways.

- Software control: Enter this mode by clearing `UART_RX_FLOW_EN` to 0. In this mode, the level of `rtsn_out` is changed by configuring `UART_SW_RTS`.
- Hardware control: Enter this mode by setting `UART_RX_FLOW_EN` to 1. In this mode, `rtsn_out` is pulled high when data in Rx_FIFO exceeds `UART_RX_FLOW_THRHD`.

Figure 24-11. Connection between Hardware Flow Control Signals

When `ctsn_in` of IU0 is low, IU0 is allowed to send data; when `ctsn_in` is high, IU0 is not allowed to send data. When IU0 detects an edge change on `ctsn_in`, a `UART_CTS_CHG_INT` interrupt is generated.

If `dtrn_out` of IU0 is high, it indicates that IU0 is ready to transmit data. `dtrn_out` is generated by configuring the `UART_SW_DTR` field. When the IU0 transmitter detects a edge change on `dsrn_in`, a `UART_DSR_CHG_INT` interrupt is generated. After this interrupt is detected, software can obtain the level of input signal `dsrn_in` by reading `UART_DSRN`. If `dsrn_in` is high, it indicates that EU0 is ready to transmit data.

In a two-wire RS485 multidrop network enabled by setting `UART_RS485_EN`, `dtrn_out` is generated by hardware and used for transmit/receive turnaround. When data transmission starts, `dtrn_out` is pulled high and the external driver is enabled; when data transmission completes, `dtrn_out` is pulled low and the external driver is disabled. Please note that when there is turnaround delay of one cycle added after the stop bit, `dtrn_out` is pulled low after the delay.

24.4.9.2 Software Flow Control

Instead of CTS/RTS lines, software flow control uses XON/XOFF characters to start or stop data transmission. Such flow control can be enabled by setting `UART_SW_FLOW_CON_EN` to 1.

When choosing software flow control, the hardware automatically detects if XON and XOFF characters are used in data flow, and generates a `UART_SW_XOFF_INT` or a `UART_SW_XON_INT` interrupt accordingly. When XOFF character is detected, the transmitter stops data transmission once the current byte has been transmitted; when XON character is detected, the transmitter starts data transmission. In addition, software can force the transmitter to stop sending data or to start sending data by setting respectively `UART_FORCE_XOFF` or `UART_FORCE_XON`.

Software determines whether to insert flow control characters according to the remaining room in the RX FIFO. When `UART_SEND_XOFF` is set, the transmitter sends an XOFF character configured by `UART_XOFF_CHAR` after the current byte in transmission; when `UART_SEND_XON` is set, the transmitter sends an XON character configured by `UART_XON_CHAR` after the current byte in transmission. If the RX FIFO of a UART controller stores more data than `UART_XOFF_THRESHOLD`, `UART_SEND_XOFF` is set by hardware. As a result, the transmitter sends an XOFF character configured by `UART_XOFF_CHAR` after the current byte in transmission. If the RX FIFO of a UART controller stores less data than `UART_XON_THRESHOLD`, `UART_SEND_XON` is set by hardware. As a result, the transmitter sends an XON character configured by `UART_XON_CHAR` after the current byte in transmission.

24.4.10 GDMA Mode

All three UART controllers on ESP32-S3 share one TX/RX GDMA (general direct memory access) channel via UHCI. In GDMA mode, UART controllers support the decoding and encoding of HCI data packets. The `UHCI_UARTn_CE` field determines which UART controller occupies the GDMA TX/RX channel.

Figure 24-12. Data Transfer in GDMA Mode

Figure 24-12 shows how data are transferred using GDMA. Before GDMA receives data, software prepares an inlink (i.e. a linked list of receive descriptors. For details, see Chapter 2 [GDMA Controller \(GDMA\)](#)).

`GDMA_INLINK_ADDR_CH n` points to the first receive descriptor in the inlink. After `GDMA_INLINK_START_CH n` is set, UHCI passes data that UART has received to the decoder. The decoded data are then stored into the RAM pointed by the inlink under the control of GDMA.

Before GDMA sends data, software prepares an outlink and data to be sent. `GDMA_OUTLINK_ADDR_CH n` points to the first transmit descriptor in the outlink. After `GDMA_OUTLINK_START_CH n` is set, GDMA reads data from the RAM pointed by outlink. The data are then encoded by the encoder, and sent sequentially by the UART transmitter.

HCI data packets have separators at the beginning and the end, with data bits in the middle (separators + data bits + separators). The encoder inserts separators in front of and after data bits, and replaces data bits identical to separators with special characters (i.e. escape characters). The decoder removes separators in front of and after data bits, and replaces escape characters with separators. There can be more than one continuous separator at the beginning and the end of a data packet. The separator is configured by `UHCI_SEPER_CHAR`, 0xC0 by default. The escape characters are configured by `UHCI_ESC_SEQ0_CHAR0` (0xDB by default) and `UHCI_ESC_SEQ0_CHAR1` (0xDD by default). When all data have been sent, a `GDMA_OUT_TOTAL_EOF_CH n _INT` interrupt is generated. When all data have been received, a `GDMA_IN_SUC_EOF_CH n _INT` is generated.

24.4.11 UART Interrupts

- `UART_AT_CMD_CHAR_DET_INT`: Triggered when the receiver detects an AT_CMD character.
- `UART_RS485_CLASH_INT`: Triggered when a collision is detected between the transmitter and the receiver in RS485 mode.
- `UART_RS485_FRM_ERR_INT`: Triggered when an error is detected in the data frame sent by the transmitter in RS485 mode.
- `UART_RS485_PARITY_ERR_INT`: Triggered when an error is detected in the parity bit sent by the transmitter in RS485 mode.
- `UART_TX_DONE_INT`: Triggered when all data in the TX FIFO have been sent.
- `UART_TX_BRK_IDLE_DONE_INT`: Triggered when the transmitter stays idle after sending the last data bit. The minimum amount of time marking the transmitter state as idle is determined by the configurable threshold value.

- `UART_TX_BRK_DONE_INT`: Triggered when the transmitter has sent all NULL characters following the complete transmission of data from the TX FIFO.
- `UART_GLITCH_DET_INT`: Triggered when the receiver detects a glitch in the middle of the start bit.
- `UART_SW_XOFF_INT`: Triggered when `UART_SW_FLOW_CON_EN` is set and the receiver receives a XOFF character.
- `UART_SW_XON_INT`: Triggered when `UART_SW_FLOW_CON_EN` is set and the receiver receives a XON character.
- `UART_RXFIFO_TOUT_INT`: Triggered when the receiver takes more time than `UART_RX_TOUT_THRHD` to receive one byte.
- `UART_BRK_DET_INT`: Triggered when the receiver detects a NULL character after stop bits.
- `UART_CTS_CHG_INT`: Triggered when the receiver detects an edge change on CTS_n signals.
- `UART_DSR_CHG_INT`: Triggered when the receiver detects an edge change on DSR_n signals.
- `UART_RXFIFO_OVF_INT`: Triggered when the receiver receives more data than the capacity of the RX FIFO.
- `UART_FRM_ERR_INT`: Triggered when the receiver detects a data frame error.
- `UART_PARITY_ERR_INT`: Triggered when the receiver detects a parity error.
- `UART_TXFIFO_EMPTY_INT`: Triggered when the TX FIFO stores less data than what `UART_TXFIFO_EMPTY_THRHD` specifies.
- `UART_RXFIFO_FULL_INT`: Triggered when the receiver receives more data than what `UART_RXFIFO_FULL_THRHD` specifies.
- `UART_WAKEUP_INT`: Triggered when UART is woken up.

24.4.12 UHCI Interrupts

- `UHCI_APP_CTRL1_INT`: Triggered when software sets `UHCI_APP_CTRL1_INT_RAW`.
- `UHCI_APP_CTRL0_INT`: Triggered when software sets `UHCI_APP_CTRL0_INT_RAW`.
- `UHCI_OUTLINK_EOF_ERR_INT`: Triggered when an EOF error is detected in a transmit descriptor.
- `UHCI_SEND_A_REG_Q_INT`: Triggered when UHCI has sent a series of short packets using `always_send`.
- `UHCI_SEND_S_REG_Q_INT`: Triggered when UHCI has sent a series of short packets using `single_send`.
- `UHCI_TX_HUNG_INT`: Triggered when UHCI takes too long to read RAM using a GDMA transmit channel.
- `UHCI_RX_HUNG_INT`: Triggered when UHCI takes too long to receive data using a GDMA receive channel.
- `UHCI_TX_START_INT`: Triggered when GDMA detects a separator character.
- `UHCI_RX_START_INT`: Triggered when a separator character has been sent.

24.5 Programming Procedures

24.5.1 Register Type

All UART registers are in APB_CLK domain. According to whether clock domain crossing and synchronization are required, UART registers that can be configured by software are classified into three types, namely

synchronous registers, static registers, and immediate registers. Synchronous registers are read in Core Clock domain, and take effect after synchronization. Static registers are also read in Core Clock domain, but would not change dynamically. Therefore, for static registers, clock domain crossing is not required, and software can turn on and off the clock for the UART transmitter or receiver to ensure that the configuration sampled in Core Clock domain is correct. Immediate registers are read in APB_CLK domain, and take effect after being configured via the APB bus.

24.5.1.1 Synchronous Registers

Since synchronous registers are read in core clock domain, but written in APB_CLK domain, they implement the clock domain crossing design to ensure that their values sampled in Core Clock domain are correct. These registers as listed in Table 24-1 are configured as follows:

- Enable register synchronization by clearing `UART_UPDATE_CTRL` to 0;
- Wait for `UART_REG_UPDATE` to become 0, which indicates the completion of last synchronization;
- Configure synchronous registers;
- Synchronize the configured values to Core Clock domain by writing 1 to `UART_REG_UPDATE`.

Table 24-1. UART_n Synchronous Registers

Register	Field
UART_CLKDIV_REG	UART_CLKDIV_FRAG[3:0]

	UART_DL0_EN
	UART_RS485_EN

24.5.1.2 Static Registers

Static registers, though also read in Core Clock domain, would not change dynamically when UART controllers are at work, so they do not implement the clock domain crossing design. These registers must be configured when the UART transmitter or receiver is not at work. In this case, software can turn off the clock for the UART transmitter or receiver, so that static registers are not sampled in their metastable state. When software turns on the clock, the configured values are stable to be correctly sampled. Static registers as listed in Table 24-2 are configured as follows:

- Turn off the clock for the UART transmitter by clearing `UART_TX_SCLK_EN`, or the clock for the UART receiver by clearing `UART_RX_SCLK_EN`, depending on which one (transmitter or receiver) is not at work;
- Configure static registers;
- Turn on the clock for the UART transmitter by writing 1 to `UART_TX_SCLK_EN`, or the clock for the UART receiver by writing 1 to `UART_RX_SCLK_EN`.

Table 24-2. UART_n Static Registers

Register	Field
UART_RX_FILT_REG	UART_GLITCH_FILT_EN
	UART_GLITCH_FILT[7:0]
UART_SLEEP_CONF_REG	UART_ACTIVE_THRESHOLD[9:0]

UART_AT_CMD_CHAR_REG	UART_CHAR_NUM[7:0]
	UART_AT_CMD_CHAR[7:0]

24.5.1.3 Immediate Registers

Except those listed in Table 24-1 and Table 24-2, registers that can be configured by software are immediate registers read in APB_CLK domain, such as interrupt and FIFO configuration registers.

24.5.2 Detailed Steps

Figure 24-13 illustrates the process to program UART controllers, namely initializing the UART, configuring the registers, enabling the transmitter and/or receiver, and finishing data transmission.

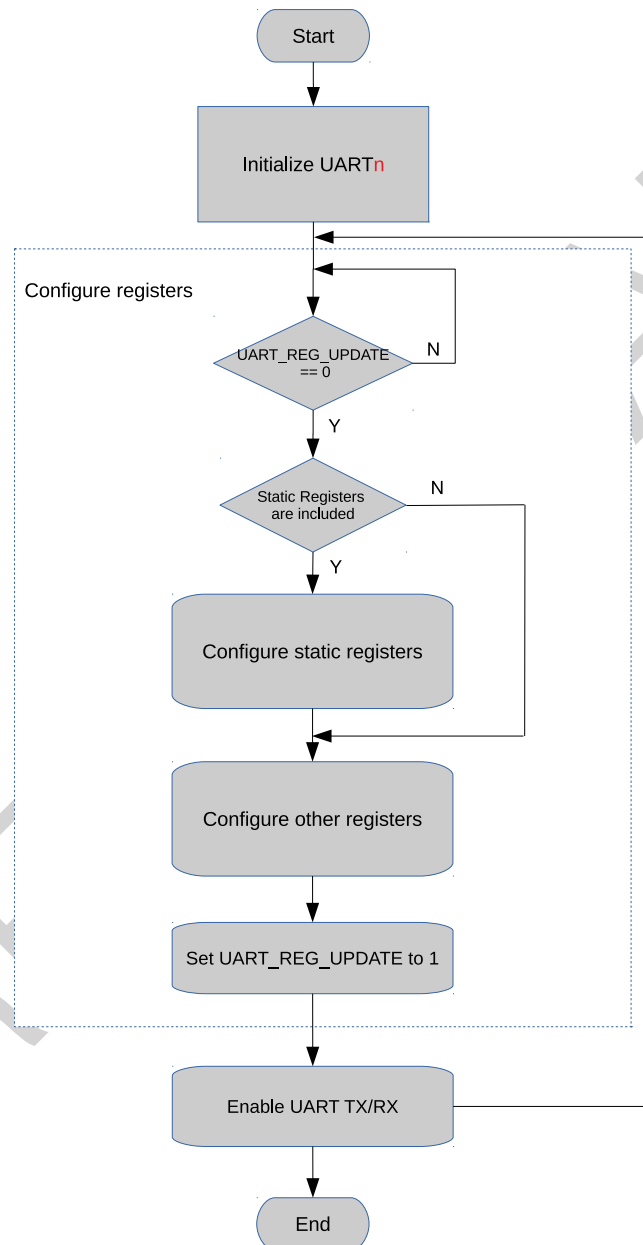

Figure 24-13. UART Programming Procedures

24.5.2.1 Initializing UART_n

Initializing UART_n requires two steps: resetting UART_n and enabling register synchronization.

To reset UART_n:

- enable the clock for UART RAM by setting `SYSTEM_UART_MEM_CLK_EN` to 1;
- enable APB_CLK for UART n by setting `SYSTEM_UART n _CLK_EN` to 1;
- clear `SYSTEM_UART n _RST`;
- write 1 to `UART_RST_CORE`;
- write 1 to `SYSTEM_UART n _RST`;
- clear `SYSTEM_UART n _RST`;
- clear `UART_RST_CORE`.

To enable register synchronization, clear `UART_UPDATE_CTRL`.

24.5.2.2 Configuring UART n Communication

To configure UART n communication:

- wait for `UART_REG_UPDATE` to become 0, which indicates the completion of last synchronization;
- configure static registers (if any) following Section 24.5.1.2;
- select the clock source via `UART_SCLK_SEL`;
- configure divisor of the divider via `UART_SCLK_DIV_NUM`, `UART_SCLK_DIV_A`, and `UART_SCLK_DIV_B`;
- configure the baud rate for transmission via `UART_CLKDIV` and `UART_CLKDIV_FRAG`;
- configure data length via `UART_BIT_NUM`;
- configure odd or even parity check via `UART_PARITY_EN` and `UART_PARITY`;
- optional steps depending on application ...
- synchronize the configured values to Core Clock domain by writing 1 to `UART_REG_UPDATE`.

24.5.2.3 Enabling UART n

To enable UART n transmitter:

- configure the TX FIFO's empty threshold via `UART_TXFIFO_EMPTY_THRHD`;
- disable `UART_TXFIFO_EMPTY_INT` interrupt by clearing `UART_TXFIFO_EMPTY_INT_ENA`;
- write data to be sent to `UART_RXFIFO_RD_BYTE`;
- clear `UART_TXFIFO_EMPTY_INT` interrupt by setting `UART_TXFIFO_EMPTY_INT_CLR`;
- enable `UART_TXFIFO_EMPTY_INT` interrupt by setting `UART_TXFIFO_EMPTY_INT_ENA`;
- detect `UART_TXFIFO_EMPTY_INT` and wait for the completion of data transmission.

To enable UART n receiver:

- configure RXFIFO's full threshold via `UART_RXFIFO_FULL_THRHD`;
- enable `UART_RXFIFO_FULL_INT` interrupt by setting `UART_RXFIFO_FULL_INT_ENA`;
- detect `UART_RXFIFO_FULL_INT` and wait until the RXFIFO is full;

- read data from RXFIFO via `UART_RXFIFO_RD_BYTE`, and obtain the number of bytes received in RXFIFO via `UART_RXFIFO_CNT`.

PRELIMINARY

24.6 Register Summary

24.6.1 UART Register Summary

The addresses in this section are relative to **UART Controller** base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
FIFO Configuration			
UART_FIFO_REG	FIFO data register	0x0000	RO
UART_MEM_CONF_REG	UART threshold and allocation configuration	0x0060	R/W
UART Interrupt Register			
UART_INT_RAW_REG	Raw interrupt status	0x0004	R/WTC/SS
UART_INT_ST_REG	Masked interrupt status	0x0008	RO
UART_INT_ENA_REG	Interrupt enable bits	0x000C	R/W
UART_INT_CLR_REG	Interrupt clear bits	0x0010	WT
Configuration Register			
UART_CLKDIV_REG	Clock divider configuration	0x0014	R/W
UART_RX_FILT_REG	RX filter configuration	0x0018	R/W
UART_CONF0_REG	Configuration register 0	0x0020	R/W
UART_CONF1_REG	Configuration register 1	0x0024	R/W
UART_FLOW_CONF_REG	Software flow control configuration	0x0034	varies
UART_SLEEP_CONF_REG	Sleep mode configuration	0x0038	R/W
UART_SWFC_CONF0_REG	Software flow control character configuration	0x003C	R/W
UART_SWFC_CONF1_REG	Software flow control character configuration	0x0040	R/W
UART_TXBRK_CONF_REG	TX break character configuration	0x0044	R/W
UART_IDLE_CONF_REG	Frame end idle time configuration	0x0048	R/W
UART_RS485_CONF_REG	RS485 mode configuration	0x004C	R/W
UART_CLK_CONF_REG	UART core clock configuration	0x0078	R/W
Status Register			
UART_STATUS_REG	UART status register	0x001C	RO
UART_MEM_TX_STATUS_REG	TX FIFO write and read offset address	0x0064	RO
UART_MEM_RX_STATUS_REG	RX FIFO write and read offset address	0x0068	RO
UART_FSM_STATUS_REG	UART transmitter and receiver status	0x006C	RO
Autobaud Register			
UART_LOWPULSE_REG	Autobaud minimum low pulse duration register	0x0028	RO
UART_HIGHPULSE_REG	Autobaud minimum high pulse duration register	0x002C	RO
UART_RXD_CNT_REG	Autobaud edge change count register	0x0030	RO
UART_POSPULSE_REG	Autobaud high pulse register	0x0070	RO
UART_NEGPULSE_REG	Autobaud low pulse register	0x0074	RO
AT Escape Sequence Selection Configuration			
UART_AT_CMD_PRECNT_REG	Pre-sequence timing configuration	0x0050	R/W
UART_AT_CMD_POSTCNT_REG	Post-sequence timing configuration	0x0054	R/W
UART_AT_CMD_GAPTOOUT_REG	Timeout configuration	0x0058	R/W
UART_AT_CMD_CHAR_REG	AT escape sequence detection configuration	0x005C	R/W

Name	Description	Address	Access
Version Register			
UART_DATE_REG	UART version control register	0x007C	R/W
UART_ID_REG	UART ID register	0x0080	varies

24.6.2 UHCI Register Summary

The addresses in this section are relative to **UHCI Controller** base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
Configuration Register			
UHCI_CONF0_REG	UHCI configuration register	0x0000	R/W
UHCI_CONF1_REG	UHCI configuration register	0x0018	varies
UHCI_ESCAPE_CONF_REG	Escape character configuration	0x0024	R/W
UHCI_HUNG_CONF_REG	Timeout configuration	0x0028	R/W
UHCI_ACK_NUM_REG	UHCI ACK number configuration	0x002C	varies
UHCI_QUICK_SENT_REG	UHCI quick_sent configuration register	0x0034	varies
UHCI_REG_Q0_WORD0_REG	Q0_WORD0 quick_sent register	0x0038	R/W
UHCI_REG_Q0_WORD1_REG	Q0_WORD1 quick_sent register	0x003C	R/W
UHCI_REG_Q1_WORD0_REG	Q1_WORD0 quick_sent register	0x0040	R/W
UHCI_REG_Q1_WORD1_REG	Q1_WORD1 quick_sent register	0x0044	R/W
UHCI_REG_Q2_WORD0_REG	Q2_WORD0 quick_sent register	0x0048	R/W
UHCI_REG_Q2_WORD1_REG	Q2_WORD1 quick_sent register	0x004C	R/W
UHCI_REG_Q3_WORD0_REG	Q3_WORD0 quick_sent register	0x0050	R/W
UHCI_REG_Q3_WORD1_REG	Q3_WORD1 quick_sent register	0x0054	R/W
UHCI_REG_Q4_WORD0_REG	Q4_WORD0 quick_sent register	0x0058	R/W
UHCI_REG_Q4_WORD1_REG	Q4_WORD1 quick_sent register	0x005C	R/W
UHCI_REG_Q5_WORD0_REG	Q5_WORD0 quick_sent register	0x0060	R/W
UHCI_REG_Q5_WORD1_REG	Q5_WORD1 quick_sent register	0x0064	R/W
UHCI_REG_Q6_WORD0_REG	Q6_WORD0 quick_sent register	0x0068	R/W
UHCI_REG_Q6_WORD1_REG	Q6_WORD1 quick_sent register	0x006C	R/W
UHCI_ESC_CONF0_REG	Escape sequence configuration register 0	0x0070	R/W
UHCI_ESC_CONF1_REG	Escape sequence configuration register 1	0x0074	R/W
UHCI_ESC_CONF2_REG	Escape sequence configuration register 2	0x0078	R/W
UHCI_ESC_CONF3_REG	Escape sequence configuration register 3	0x007C	R/W
UHCI_PKT_THRES_REG	Configuration register for packet length	0x0080	R/W
UHCI Interrupt Register			
UHCI_INT_RAW_REG	Raw interrupt status	0x0004	varies
UHCI_INT_ST_REG	Masked interrupt status	0x0008	RO
UHCI_INT_ENA_REG	Interrupt enable bits	0x000C	R/W
UHCI_INT_CLR_REG	Interrupt clear bits	0x0010	WT
UHCI_APP_INT_SET_REG	Software interrupt trigger source	0x0014	WT
UHCI Status Register			
UHCI_STATE0_REG	UHCI receive status	0x001C	RO

Name	Description	Address	Access
UHCI_STATE1_REG	UHCI transmit status	0x0020	RO
UHCI_RX_HEAD_REG	UHCI packet header register	0x0030	RO
Version Register			
UHCI_DATE_REG	UHCI version control register	0x0084	R/W

24.7 Registers

24.7.1 UART Registers

The addresses in this section are relative to **UART Controller** base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 24.1. UART_FIFO_REG (0x0000)

(reserved)																UART_RXFIFO_RD_BYTE		
31															8	7	0	
0																0		Reset

UART_RXFIFO_RD_BYTE UART_n accesses FIFO via this field. (RO)

Register 24.2. UART_MEM_CONF_REG (0x0060)

(reserved)					UART_MEM_FORCE_PU		UART_MEM_FORCE_PD		UART_RX_TOUT_THRHD				UART_RX_FLOW_THRHD				UART_TX_SIZE			UART_RX_SIZE		(reserved)			
31	29	28	27	26					17	16					7	6	4	3	1	0					
0					0					0xa				0x0				0x1			1		0		Reset

UART_RX_SIZE This field is used to configure the amount of RAM allocated for RX FIFO. The default number is 128 bytes. (R/W)

UART_TX_SIZE This field is used to configure the amount of RAM allocated for TX FIFO. The default number is 128 bytes. (R/W)

UART_RX_FLOW_THRHD This field is used to configure the maximum amount of data bytes that can be received when hardware flow control works. (R/W)

UART_RX_TOUT_THRHD This field is used to configure the threshold time that receiver takes to receive one byte, in the unit of bit time (the time it takes to transfer one bit). The UART_RXFIFO_TOUT_INT interrupt will be triggered when the receiver takes more time to receive one byte with UART_RX_TOUT_EN set to 1. (R/W)

UART_MEM_FORCE_PD Set this bit to force power down UART RAM. (R/W)

UART_MEM_FORCE_PU Set this bit to force power up UART RAM. (R/W)

Register 24.3. UART_INT_RAW_REG (0x0004)

Continued from the previous page...

UART_TX_BRK_DONE_INT_RAW This interrupt raw bit turns to high level when the transmitter completes sending NULL characters, after all data in TX FIFO are sent. (R/WTC/SS)

UART_TX_BRK_IDLE_DONE_INT_RAW This interrupt raw bit turns to high level when the transmitter has kept the shortest duration after sending the last data. (R/WTC/SS)

UART_TX_DONE_INT_RAW This interrupt raw bit turns to high level when the transmitter has sent out all data in FIFO. (R/WTC/SS)

UART_RS485_PARITY_ERR_INT_RAW This interrupt raw bit turns to high level when the receiver detects a parity error from the echo of the transmitter in RS485 mode. (R/WTC/SS)

UART_RS485_FRM_ERR_INT_RAW This interrupt raw bit turns to high level when the receiver detects a data frame error from the echo of the transmitter in RS485 mode. (R/WTC/SS)

UART_RS485_CLASH_INT_RAW This interrupt raw bit turns to high level when a collision is detected between the transmitter and the receiver in RS485 mode. (R/WTC/SS)

UART_AT_CMD_CHAR_DET_INT_RAW This interrupt raw bit turns to high level when the receiver detects the configured UART_AT_CMD_CHAR. (R/WTC/SS)

UART_WAKEUP_INT_RAW This interrupt raw bit turns to high level when the input RXD edge changes more times than what UART_ACTIVE_THRESHOLD specifies in Light-sleep mode. (R/WTC/SS)

Register 24.4. UART_INT_ST_REG (0x0008)

31	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	Reset	
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Reset

UART_RXFIFO_FULL_INT_ST This is the status bit for UART_RXFIFO_FULL_INT when UART_RXFIFO_FULL_INT_ENA is set to 1. (RO)

UART_TXFIFO_EMPTY_INT_ST This is the status bit for UART_TXFIFO_EMPTY_INT when UART_TXFIFO_EMPTY_INT_ENA is set to 1. (RO)

UART_PARITY_ERR_INT_ST This is the status bit for UART_PARITY_ERR_INT when UART_PARITY_ERR_INT_ENA is set to 1. (RO)

UART_FRM_ERR_INT_ST This is the status bit for UART_FRM_ERR_INT when UART_FRM_ERR_INT_ENA is set to 1. (RO)

UART_RXFIFO_OVF_INT_ST This is the status bit for UART_RXFIFO_OVF_INT when UART_RXFIFO_OVF_INT_ENA is set to 1. (RO)

UART_DSR_CHG_INT_ST This is the status bit for UART_DSR_CHG_INT when UART_DSR_CHG_INT_ENA is set to 1. (RO)

UART_CTS_CHG_INT_ST This is the status bit for UART_CTS_CHG_INT when UART_CTS_CHG_INT_ENA is set to 1. (RO)

UART_BRK_DET_INT_ST This is the status bit for UART_BRK_DET_INT when UART_BRK_DET_INT_ENA is set to 1. (RO)

UART_RXFIFO_TOUT_INT_ST This is the status bit for UART_RXFIFO_TOUT_INT when UART_RXFIFO_TOUT_INT_ENA is set to 1. (RO)

UART_SW_XON_INT_ST This is the status bit for UART_SW_XON_INT when UART_SW_XON_INT_ENA is set to 1. (RO)

UART_SW_XOFF_INT_ST This is the status bit for UART_SW_XOFF_INT when UART_SW_XOFF_INT_ENA is set to 1. (RO)

UART_GLITCH_DET_INT_ST This is the status bit for UART_GLITCH_DET_INT when UART_GLITCH_DET_INT_ENA is set to 1. (RO)

UART_TX_BRK_DONE_INT_ST This is the status bit for UART_TX_BRK_DONE_INT when UART_TX_BRK_DONE_INT_ENA is set to 1. (RO)

Continued on the next page...

Register 24.4. UART_INT_ST_REG (0x0008)

Continued from the previous page...

UART_TX_BRK_IDLE_DONE_INT_ST This is the status bit for UART_TX_BRK_IDLE_DONE_INT when UART_TX_BRK_IDLE_DONE_INT_ENA is set to 1. (RO)

UART_TX_DONE_INT_ST This is the status bit for UART_TX_DONE_INT when UART_TX_DONE_INT_ENA is set to 1. (RO)

UART_RS485_PARITY_ERR_INT_ST This is the status bit for UART_RS485_PARITY_ERR_INT when UART_RS485_PARITY_INT_ENA is set to 1. (RO)

UART_RS485_FRM_ERR_INT_ST This is the status bit for UART_RS485_FRM_ERR_INT when UART_RS485_FRM_ERR_INT_ENA is set to 1. (RO)

UART_RS485_CLASH_INT_ST This is the status bit for UART_RS485_CLASH_INT when UART_RS485_CLASH_INT_ENA is set to 1. (RO)

UART_AT_CMD_CHAR_DET_INT_ST This is the status bit for UART_AT_CMD_CHAR_DET_INT when UART_AT_CMD_CHAR_DET_INT_ENA is set to 1. (RO)

UART_WAKEUP_INT_ST This is the status bit for UART_WAKEUP_INT when UART_WAKEUP_INT_ENA is set to 1. (RO)

Register 24.5. UART_INT_ENA_REG (0x000C)

Continued from the previous page...

UART_RS485_PARITY_ERR_INT_ENA This is the enable bit for UART_RS485_PARITY_ERR_INT.
(R/W)

UART_RS485_FRM_ERR_INT_ENA This is the enable bit for UART_RS485_PARITY_ERR_INT.
(R/W)

UART_RS485_CLASH_INT_ENA This is the enable bit for UART_RS485_CLASH_INT. (R/W)

UART_AT_CMD_CHAR_DET_INT_ENA This is the enable bit for UART_AT_CMD_CHAR_DET_INT.
(R/W)

UART_WAKEUP_INT_ENA This is the enable bit for UART_WAKEUP_INT. (R/W)

Register 24.9. UART_CONF0_REG (0x0020)

Continued from the previous page...

UART_TXD_INV Set this bit to invert the level value of UART TXD signal. (R/W)

UART_RTS_INV Set this bit to invert the level value of UART RTS signal. (R/W)

UART_DTR_INV Set this bit to invert the level value of UART DTR signal. (R/W)

UART_CLK_EN 0: Support clock only when application writes registers; 1: Force clock on for registers. (R/W)

UART_ERR_WR_MASK 0: Receiver stores the data even if the received data is wrong; 1: Receiver stops storing data into FIFO when data is wrong. (R/W)

UART_AUTOBAUD_EN This is the enable bit for baud rate detection. (R/W)

UART_MEM_CLK_EN The signal to enable UART RAM clock gating. (R/W)

Register 24.10. UART_CONF1_REG (0x0024)

(reserved)								UART_RX_TOUT_EN										UART_TXFIFO_EMPTY_THRHD										UART_RXFIFO_FULL_THRHD									
UART_RX_FLOW_EN								UART_RX_TOUT_FLOW_DIS										UART_TXFIFO_EMPTY_THRHD										UART_RXFIFO_FULL_THRHD									
UART_DIS_RX_DAT_OVF								UART_TXFIFO_EMPTY_THRHD										UART_RXFIFO_FULL_THRHD										UART_RXFIFO_FULL_THRHD									
31	24	23	22	21	20	19	10	9	0	0x60										0x60										Reset							
0	0	0	0	0	0	0	0	0	0	0x60										0x60										Reset							

UART_RXFIFO_FULL_THRHD An UART_RXFIFO_FULL_INT interrupt is generated when the receiver receives more data than the value of this field. (R/W)

UART_TXFIFO_EMPTY_THRHD An UART_TXFIFO_EMPTY_INT interrupt is generated when the number of data bytes in TX FIFO is less than the value of this field. (R/W)

UART_DIS_RX_DAT_OVF Disable UART RX data overflow detection. (R/W)

UART_RX_TOUT_FLOW_DIS Set this bit to stop accumulating idle_cnt when hardware flow control works. (R/W)

UART_RX_FLOW_EN This is the flow enable bit for UART receiver. (R/W)

UART_RX_TOUT_EN This is the enable bit for UART receiver's timeout function. (R/W)

Register 24.13. UART_SWFC_CONF0_REG (0x003C)

(reserved)													UART_XOFF_CHAR				UART_XOFF_THRESHOLD							
31													18	17				10	9				0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0													0x13				0xe0				Reset			

UART_XOFF_THRESHOLD When the number of data bytes in RX FIFO is more than the value of this field with UART_SW_FLOW_CON_EN set to 1, the transmitter sends an XOFF character. (R/W)

UART_XOFF_CHAR This field stores the XOFF flow control character. (R/W)

Register 24.14. UART_SWFC_CONF1_REG (0x0040)

(reserved)													UART_XON_CHAR				UART_XON_THRESHOLD							
31													18	17				10	9				0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0													0x11				0x0				Reset			

UART_XON_THRESHOLD When the number of data bytes in RX FIFO is less than the value of this field with UART_SW_FLOW_CON_EN set to 1, the transmitter sends an XON character. (R/W)

UART_XON_CHAR This field stores the XON flow control character. (R/W)

Register 24.15. UART_TXBRK_CONF_REG (0x0044)

(reserved)													UART_TX_BRK_NUM						
31													8	7				0	
0 0													0xa				Reset		

UART_TX_BRK_NUM This field is used to configure the number of 0 to be sent after the process of sending data is done. It is active when UART_TXD_BRK is set to 1. (R/W)

Register 24.16. UART_IDLE_CONF_REG (0x0048)

(reserved)										UART_TX_IDLE_NUM										UART_RX_IDLE_THRHD																				
31											20	19											10	9											0					
0										0										0x100										0x100										Reset

UART_RX_IDLE_THRHD A frame end signal is generated when the receiver takes more time to receive one byte data than the value of this field, in the unit of bit time (the time it takes to transfer one bit). (R/W)

UART_TX_IDLE_NUM This field is used to configure the duration time between transfers, in the unit of bit time (the time it takes to transfer one bit). (R/W)

Register 24.17. UART_RS485_CONF_REG (0x004C)

(reserved)										UART_RS485_TX_DLY_NUM										UART_RS485_RX_DLY_NUM										UART_RS485RXBY_TX_EN										UART_RS485TX_RX_EN										UART_DL1_EN										UART_DL0_EN										UART_RS485_EN										
31											20	19											10	9											6	5	4	3	2	1	0																																							
0										0										0										0										0										0										0										0										Reset

UART_RS485_EN Set this bit to choose RS485 mode. (R/W)

UART_DL0_EN Set this bit to delay the stop bit by 1 bit. (R/W)

UART_DL1_EN Set this bit to delay the stop bit by 1 bit. (R/W)

UART_RS485TX_RX_EN Set this bit to enable receiver could receive data when the transmitter is transmitting data in RS485 mode. (R/W)

UART_RS485RXBY_TX_EN 1: enable RS485 transmitter to send data when RS485 receiver line is busy. (R/W)

UART_RS485_RX_DLY_NUM This bit is used to delay the receiver's internal data signal. (R/W)

UART_RS485_TX_DLY_NUM This field is used to delay the transmitter's internal data signal. (R/W)

Register 24.18. UART_CLK_CONF_REG (0x0078)

(reserved)				UART_RX_RST_CORE				UART_TX_RST_CORE				UART_RX_SCLK_EN				UART_TX_SCLK_EN				UART_RST_CORE				UART_SCLK_EN				UART_SCLK_SEL				UART_SCLK_DIV_NUM				UART_SCLK_DIV_A				UART_SCLK_DIV_B			
31	28	27	26	25	24	23	22	21	20	19	12	11	6	5	0	Reset																											
0	0	0	0	0	0	1	1	0	1	3	0x1				0x0				0x0																								

UART_SCLK_DIV_B The denominator of the frequency divisor. (R/W)

UART_SCLK_DIV_A The numerator of the frequency divisor. (R/W)

UART_SCLK_DIV_NUM The integral part of the frequency divisor. (R/W)

UART_SCLK_SEL Selects UART clock source. 1: APB_CLK; 2: FOSC_CLK; 3: XTAL_CLK. (R/W)

UART_SCLK_EN Set this bit to enable UART TX/RX clock. (R/W)

UART_RST_CORE Write 1 and then write 0 to this bit, to reset UART TX/RX. (R/W)

UART_TX_SCLK_EN Set this bit to enable UART TX clock. (R/W)

UART_RX_SCLK_EN Set this bit to enable UART RX clock. (R/W)

UART_TX_RST_CORE Write 1 and then write 0 to this bit, to reset UART TX. (R/W)

UART_RX_RST_CORE Write 1 and then write 0 to this bit, to reset UART RX. (R/W)

Register 24.19. UART_STATUS_REG (0x001C)

UART_TXD				UART_RTSN				UART_DTRN				(reserved)				UART_TXFIFO_CNT				UART_RXD				UART_CTSN				UART_DSRN				(reserved)				UART_RXFIFO_CNT								
31	30	29	28	26	25	0																16	15	14	13	12	10	9	0															
1	1	1	0	0	0	0																1	1	0	0	0	0	0	0															

UART_RXFIFO_CNT Stores the number of valid data bytes in RX FIFO. (RO)

UART_DSRN This bit represents the level of the internal UART DSR signal. (RO)

UART_CTSN This bit represents the level of the internal UART CTS signal. (RO)

UART_RXD This bit represents the level of the internal UART RXD signal. (RO)

UART_TXFIFO_CNT Stores the number of data bytes in TX FIFO. (RO)

UART_DTRN This bit represents the level of the internal UART DTR signal. (RO)

UART_RTSN This bit represents the level of the internal UART RTS signal. (RO)

UART_TXD This bit represents the level of the internal UART TXD signal. (RO)

Register 24.23. UART_LOWPULSE_REG (0x0028)

UART_LOWPULSE_MIN_CNT This field stores the value of the minimum duration time of the low level pulse, in the unit of APB_CLK cycles. It is used in baud rate detection. (RO)

Register 24.24. UART_HIGHPULSE_REG (0x002C)

UART_HIGHPULSE_MIN_CNT This field stores the value of the maximum duration time for the high level pulse, in the unit of APB_CLK cycles. It is used in baud rate detection. (RO)

Register 24.25. UART_RXD_CNT_REG (0x0030)

UART_RXD_EDGE_CNT This field stores the count of RXD edge change. It is used in baud rate detection. (RO)

Register 24.29. UART_AT_CMD_POSTCNT_REG (0x0054)

(reserved)																UART_POST_IDLE_NUM																	
31																16	15																0
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0																0x901															Reset		

UART_POST_IDLE_NUM This field is used to configure the duration time between the last AT_CMD and the next data byte, in the unit of bit time (the time it takes to transfer one bit). (R/W)

Register 24.30. UART_AT_CMD_GAPTOU_REG (0x0058)

(reserved)																UART_RX_GAP_TOUT																	
31																16	15																0
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0																11															Reset		

UART_RX_GAP_TOUT This field is used to configure the duration time between the AT_CMD characters, in the unit of bit time (the time it takes to transfer one bit). (R/W)

Register 24.31. UART_AT_CMD_CHAR_REG (0x005C)

(reserved)																UART_CHAR_NUM												UART_AT_CMD_CHAR					
31																16	15							8	7						0		
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0																0x3						0x2b						Reset					

UART_AT_CMD_CHAR This field is used to configure the content of AT_CMD character. (R/W)

UART_CHAR_NUM This field is used to configure the number of continuous AT_CMD characters received by the receiver. (R/W)

Register 24.32. UART_DATE_REG (0x007C)

UART_DATE	
31	0
0x2008270	
Reset	

UART_DATE This is the version control register. (R/W)

Register 24.33. UART_ID_REG (0x0080)

UART_ID	
UART_REG_UPDATE UART_UPDATE_CTRL	
31	0
30	29
0x000500	
0	1
Reset	

UART_ID This field is used to configure the UART_ID. (R/W)

UART_UPDATE_CTRL This bit is used to control register synchronization mode. 0: After registers are configured, software needs to write 1 to UART_REG_UPDATE to synchronize registers; 1: Registers are automatically synchronized into UART Core's clock domain. (R/W)

UART_REG_UPDATE When this bit is set to 1 by software, registers are synchronized to UART Core's clock domain. This bit is cleared by hardware after synchronization is done. (R/W/SC)

24.7.2 UHCI Registers

The addresses in this section are relative to **UHCI Controller** base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 24.35. UHCI_CONF1_REG (0x0018)

(reserved)										UHCI_SW_START UHCI_WAIT_SW_START (reserved) UHCI_TX_ACK_NUM_RE UHCI_TX_CHECK_SUM_RE UHCI_SAVE_HEAD UHCI_CRC_DISABLE UHCI_CHECK_SEQ_EN UHCI_CHECK_SUM_EN											
31											9	8	7	6	5	4	3	2	1	0	
0										0	0	0	0	0	0	0	0	0	0	0	Reset

UHCI_CHECK_SUM_EN This is the enable bit to check header checksum when UHCI receives a data packet. (R/W)

UHCI_CHECK_SEQ_EN This is the enable bit to check sequence number when UHCI receives a data packet. (R/W)

UHCI_CRC_DISABLE Set this bit to support CRC calculation. Data Integrity Check Present bit in UHCI packet frame should be 1. (R/W)

UHCI_SAVE_HEAD Set this bit to save the packet header when UHCI receives a data packet. (R/W)

UHCI_TX_CHECK_SUM_RE Set this bit to encode the data packet with a checksum. (R/W)

UHCI_TX_ACK_NUM_RE Set this bit to encode the data packet with an acknowledgment when a reliable packet is to be transmitted. (R/W)

UHCI_WAIT_SW_START The UHCI encoder will jump to ST_SW_WAIT status if this bit is set to 1. (R/W)

UHCI_SW_START If current UHCI_ENCODE_STATE is ST_SW_WAIT, the UHCI will start to send data packet out when this bit is set to 1. (R/W/SC)

Register 24.36. UHCI_ESCAPE_CONF_REG (0x0024)

UHCI_TX_DB_ESC_EN Set this bit to to decode character 0xDB when DMA receives data. (R/W)

UHCI_TX_11_ESC_EN Set this bit to to decode flow control character 0x11 when DMA receives data. (R/W)

UHCI_TX_13_ESC_EN Set this bit to to decode flow control character 0x13 when DMA receives data. (R/W)

UHCI_RX_C0_ESC_EN Set this bit to replace 0xC0 by special characters when DMA sends data. (R/W)

UHCI_RX_DB_ESC_EN Set this bit to replace 0xDB by special characters when DMA sends data. (R/W)

UHCI_RX_11_ESC_EN Set this bit to replace flow control character 0x11 by special characters when DMA sends data. (R/W)

UHCI_RX_13_ESC_EN Set this bit to replace flow control character 0x13 by special characters when DMA sends data. (R/W)

Register 24.39. UHCI_QUICK_SENT_REG (0x0034)

UHCI_SINGLE_SEND_NUM This field is used to specify single_send mode. (R/W)

UHCI_SINGLE_SEND_EN Set this bit to enable single_send mode to send short packets. (R/W/SC)

UHCI_ALWAYS_SEND_NUM This field is used to specify always_send mode. (R/W)

UHCI_ALWAYS_SEND_EN Set this bit to enable always_send mode to send short packets. (R/W)

Register 24.40. UHCI_REG_Q0_WORD0_REG (0x0038)

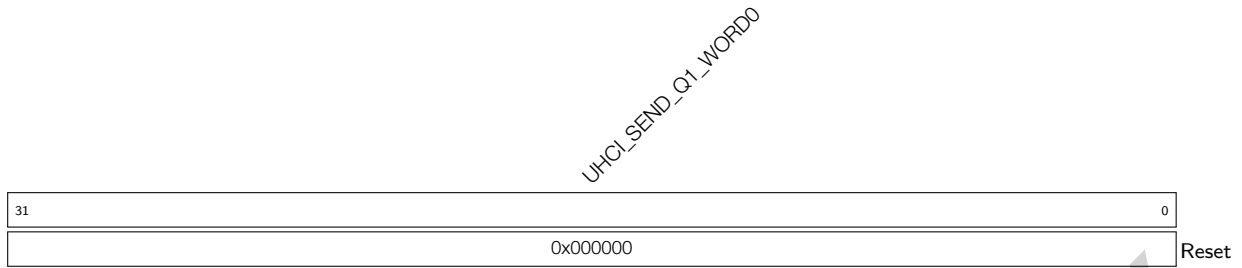

UHCI_SEND_Q0_WORD0 This register is used as a quick_send register when mode is specified by UHCI_ALWAYS_SEND_NUM or UHCI_SINGLE_SEND_NUM. (R/W)

Register 24.41. UHCI_REG_Q0_WORD1_REG (0x003C)

UHCI_SEND_Q0_WORD1 This register is used as a quick_send register when mode is specified by UHCI_ALWAYS_SEND_NUM or UHCI_SINGLE_SEND_NUM. (R/W)

Register 24.42. UHCI_REG_Q1_WORD0_REG (0x0040)

UHCI_SEND_Q1_WORD0 This register is used as a quick_sent register when mode is specified by UHCI_ALWAYS_SEND_NUM or UHCI_SINGLE_SEND_NUM. (R/W)

Register 24.43. UHCI_REG_Q1_WORD1_REG (0x0044)

UHCI_SEND_Q1_WORD1 This register is used as a quick_sent register when mode is specified by UHCI_ALWAYS_SEND_NUM or UHCI_SINGLE_SEND_NUM. (R/W)

Register 24.44. UHCI_REG_Q2_WORD0_REG (0x0048)

UHCI_SEND_Q2_WORD0 This register is used as a quick_sent register when mode is specified by UHCI_ALWAYS_SEND_NUM or UHCI_SINGLE_SEND_NUM. (R/W)

Register 24.45. UHCI_REG_Q2_WORD1_REG (0x004C)

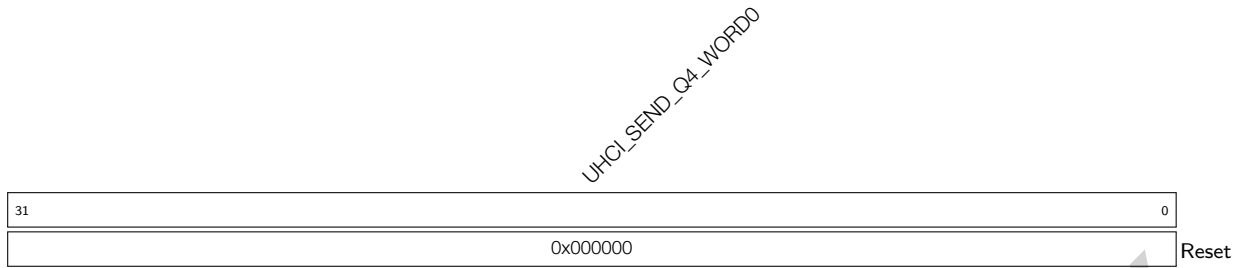

UHCI_SEND_Q2_WORD1 This register is used as a quick_sent register when mode is specified by UHCI_ALWAYS_SEND_NUM or UHCI_SINGLE_SEND_NUM. (R/W)

Register 24.46. UHCI_REG_Q3_WORD0_REG (0x0050)

UHCI_SEND_Q3_WORD0 This register is used as a quick_sent register when mode is specified by UHCI_ALWAYS_SEND_NUM or UHCI_SINGLE_SEND_NUM. (R/W)

Register 24.47. UHCI_REG_Q3_WORD1_REG (0x0054)

UHCI_SEND_Q3_WORD1 This register is used as a quick_sent register when mode is specified by UHCI_ALWAYS_SEND_NUM or UHCI_SINGLE_SEND_NUM. (R/W)

Register 24.48. UHCI_REG_Q4_WORD0_REG (0x0058)

UHCI_SEND_Q4_WORD0 This register is used as a quick_sent register when mode is specified by UHCI_ALWAYS_SEND_NUM or UHCI_SINGLE_SEND_NUM. (R/W)

Register 24.49. UHCI_REG_Q4_WORD1_REG (0x005C)

UHCI_SEND_Q4_WORD1 This register is used as a quick_sent register when mode is specified by UHCI_ALWAYS_SEND_NUM or UHCI_SINGLE_SEND_NUM. (R/W)

Register 24.50. UHCI_REG_Q5_WORD0_REG (0x0060)

UHCI_SEND_Q5_WORD0 This register is used as a quick_sent register when mode is specified by UHCI_ALWAYS_SEND_NUM or UHCI_SINGLE_SEND_NUM. (R/W)

Register 24.51. UHCI_REG_Q5_WORD1_REG (0x0064)

UHCI_SEND_Q5_WORD1 This register is used as a quick_sent register when mode is specified by UHCI_ALWAYS_SEND_NUM or UHCI_SINGLE_SEND_NUM. (R/W)

Register 24.52. UHCI_REG_Q6_WORD0_REG (0x0068)

UHCI_SEND_Q6_WORD0 This register is used as a quick_sent register when mode is specified by UHCI_ALWAYS_SEND_NUM or UHCI_SINGLE_SEND_NUM. (R/W)

Register 24.53. UHCI_REG_Q6_WORD1_REG (0x006C)

UHCI_SEND_Q6_WORD1 This register is used as a quick_sent register when mode is specified by UHCI_ALWAYS_SEND_NUM or UHCI_SINGLE_SEND_NUM. (R/W)

Reset	

UHCI_DATE This is the version control register. (R/W)

PRELIMINARY

25 I2C Controller (I2C)

The I2C (Inter-Integrated Circuit) bus allows ESP32-S3 to communicate with multiple external devices. These external devices can share one bus.

25.1 Overview

The I2C bus has two lines, namely a serial data line (SDA) and a serial clock line (SCL). Both SDA and SCL lines are open-drain. The I2C bus can be connected to a single or multiple master devices and a single or multiple slave devices. However, only one master device can access a slave at a time via the bus.

The master initiates communication by generating a START condition: pulling the SDA line low while SCL is high, and sending nine clock pulses via SCL. The first eight pulses are used to transmit a 7-bit address followed by a read/write (R/\overline{W}) bit. If the address of an I2C slave matches the 7-bit address transmitted, this matching slave can respond by pulling SDA low on the ninth clock pulse. The master and the slave can send or receive data according to the R/\overline{W} bit. Whether to terminate the data transfer or not is determined by the logic level of the acknowledge (ACK) bit. During data transfer, SDA changes only when SCL is low. Once finishing communication, the master sends a STOP condition: pulling SDA up while SCL is high. If a master both reads and writes data in one transfer, then it should send a RSTART condition, a slave address and a R/\overline{W} bit before changing its operation. The RSTART condition is used to change the transfer direction and the mode of the devices (master mode or slave mode).

25.2 Features

The I2C controller has the following features:

- Master mode and slave mode
- Communication between multiple masters and slaves
- Standard mode (100 Kbit/s)
- Fast mode (400 Kbit/s)
- 7-bit addressing and 10-bit addressing
- Continuous data transfer achieved by pulling SCL low
- Programmable digital noise filtering
- Double addressing mode, which uses slave address and slave memory or register address

25.3 I2C Architecture

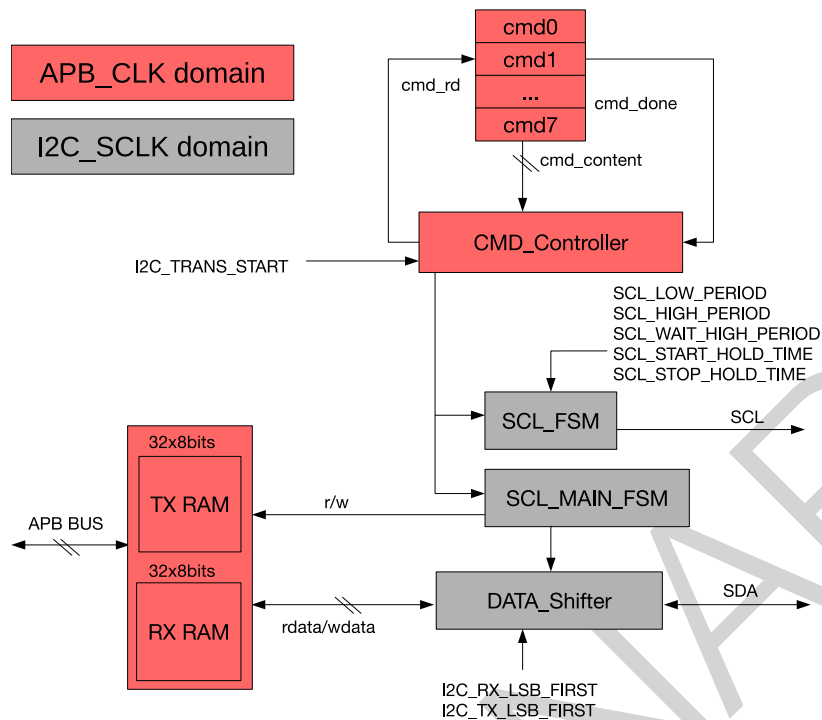

Figure 25-1. I2C Master Architecture

Figure 25-2. I2C Slave Architecture

The I2C controller runs either in master mode or slave mode, which is determined by `I2C_MS_MODE`. Figure 25-1 shows the architecture of a master, while Figure 25-2 shows that of a slave. The I2C controller has the following main parts:

- transmit and receive memory (TX/RX RAM)
- command controller (CMD_Controller)
- SCL clock controller (SCL_FSM)
- SDA data controller (SCL_MAIN_FSM)

- serial/parallel data converter (DATA_Shifter)
- filter for SCL (SCL_Filter)
- filter for SDA (SDA_Filter)

Besides, the I2C controller also has a clock module which generates I2C clocks, and a synchronization module which synchronizes the APB bus and the I2C controller.

The clock module is used to select clock sources, turn on and off clocks, and divide clocks. SCL_Filter and SDA_Filter remove noises on SCL input signals and SDA input signals respectively. The synchronization module synchronizes signal transfer between different clock domains.

Figure 25-3 and Figure 25-4 are the timing diagram and corresponding parameters of the I2C protocol. SCL_FSM generates the timing sequence conforming to the I2C protocol.

SCL_MAIN_FSM controls the execution of I2C commands and the sequence of the SDA line. CMD_Controller is used for an I2C master to generate (R)START, STOP, WRITE, READ and END commands. TX RAM and RX RAM store data to be transmitted and data received respectively. DATA_Shifter shifts data between serial and parallel form.

Figure 25-3. I2C Protocol Timing (Cited from Fig.31 in [The I2C-bus specification Version 2.1](#))

PARAMETER	SYMBOL	STANDARD-MODE		FAST-MODE		UNIT
		MIN.	MAX.	MIN.	MAX.	
SCL clock frequency	f _{SCL}	0	100	0	400	kHz
Hold time (repeated) START condition. After this period, the first clock pulse is generated	t _{HD;STA}	4.0	–	0.6	–	μs
LOW period of the SCL clock	t _{LOW}	4.7	–	1.3	–	μs
HIGH period of the SCL clock	t _{HIGH}	4.0	–	0.6	–	μs
Set-up time for a repeated START condition	t _{SU;STA}	4.7	–	0.6	–	μs
Data hold time: for CBUS compatible masters (see NOTE, Section 10.1.3) for I ² C-bus devices	t _{HD;DAT}	5.0 0 ⁽²⁾	– 3.45 ⁽³⁾	– 0 ⁽²⁾	– 0.9 ⁽³⁾	μs μs
Data set-up time	t _{SU;DAT}	250	–	100 ⁽⁴⁾	–	ns
Rise time of both SDA and SCL signals	t _r	–	1000	20 + 0.1C _b ⁽⁵⁾	300	ns
Fall time of both SDA and SCL signals	t _f	–	300	20 + 0.1C _b ⁽⁵⁾	300	ns
Set-up time for STOP condition	t _{SU;STO}	4.0	–	0.6	–	μs
Bus free time between a STOP and START condition	t _{BUF}	4.7	–	1.3	–	μs

Figure 25-4. I2C Timing Parameters (Cited from Table 5 in [The I2C-bus specification Version 2.1](#))

25.4 Functional Description

Note that operations may differ between the I2C controller in ESP32-S3 and other masters or slaves on the bus. Please refer to datasheets of individual I2C devices for specific information.

25.4.1 Clock Configuration

Registers, TX RAM, and RX RAM are configured and accessed in the APB_CLK clock domain, whose frequency is 1 ~ 80 MHz. The main logic of the I2C controller, including SCL_FSM, SCL_MAIN_FSM, SCL_FILTER, SDA_FILTER, and DATA_SHIFTER, are in the I2C_SCLK clock domain.

You can choose the clock source for I2C_SCLK from XTAL_CLK or FOSC_CLK via [I2C_SCLK_SEL](#). When [I2C_SCLK_SEL](#) is cleared, the clock source is XTAL_CLK. When [I2C_SCLK_SEL](#) is set, the clock source is FOSC_CLK. The clock source is enabled by configuring [I2C_SCLK_ACTIVE](#) as high level, and then passes through a fractional divider to generate I2C_SCLK according to the following equation:

$$Divisor = I2C_SCLK_DIV_NUM + 1 + \frac{I2C_SCLK_DIV_A}{I2C_SCLK_DIV_B}$$

The frequency of XTAL_CLK is 40 MHz, while the frequency of FOSC_CLK is 17.5 MHz. Limited by timing parameters, the derived clock I2C_SCLK should operate at a frequency 20 times larger than SCL's frequency.

25.4.2 SCL and SDA Noise Filtering

SCL_Filter and SDA_Filter modules are identical and are used to filter signal noises on SCL and SDA, respectively. These filters can be enabled or disabled by configuring [I2C_SCL_FILTER_EN](#) and [I2C_SDA_FILTER_EN](#).

Take SCL_Filter as an example. When enabled, SCL_Filter samples input signals on the SCL line continuously. These input signals are valid only if they remain unchanged for consecutive [I2C_SCL_FILTER_THRES](#) I2C_SCLK

clock cycles. Given that only valid input signals can pass through the filter, SCL_Filter can remove glitches whose pulse width is shorter than `I2C_SCL_FILTER_THRES` I2C_SCLK clock cycles, while SDA_Filter can remove glitches whose pulse width is shorter than `I2C_SDA_FILTER_THRES` I2C_SCLK clock cycles.

25.4.3 SCL Clock Stretching

The I2C controller in slave mode (i.e. slave) can hold the SCL line low in exchange for more time to process data. This function called clock stretching is enabled by setting the `I2C_SLAVE_SCL_STRETCH_EN` bit. The time period to release the SCL line from stretching is configured by setting the `I2C_STRETCH_PROTECT_NUM` field, in order to avoid timing sequence errors. The slave will hold the SCL line low when one of the following four events occurs:

1. Address match: The address of the slave matches the address sent by the master via the SDA line, and the R/\overline{W} bit is 1.
2. RAM being full: RX RAM of the slave is full. Note that when the slave receives less than 32 bytes, it is not necessary to enable clock stretching; when the slave receives 32 bytes or more, you may interrupt data transmission to wrapped around RAM via the FIFO threshold, or enable clock stretching for more time to process data. When clock stretching is enabled, `I2C_RX_FULL_ACK_LEVEL` must be cleared, otherwise there will be unpredictable consequences.
3. RAM being empty: The slave is sending data, but its TX RAM is empty.
4. Sending an ACK: If `I2C_SLAVE_BYTE_ACK_CTL_EN` is set, the slave pulls SCL low when sending an ACK bit. At this stage, software validates data and configures `I2C_SLAVE_BYTE_ACK_LVL` to control the level of the ACK bit. Note that when RX RAM of the slave is full, the level of the ACK bit to be sent is determined by `I2C_RX_FULL_ACK_LEVEL`, instead of `I2C_SLAVE_BYTE_ACK_LVL`. In this case, `I2C_RX_FULL_ACK_LEVEL` should also be cleared to ensure proper functioning of clock stretching.

After SCL has been stretched low, the cause of stretching can be read from the `I2C_STRETCH_CAUSE` bit. Clock stretching is disabled by setting the `I2C_SLAVE_SCL_STRETCH_CLR` bit.

25.4.4 Generating SCL Pulses in Idle State

Usually when the I2C bus is idle, the SCL line is held high. The I2C controller in ESP32-S3 can be programmed to generate SCL pulses in idle state. This function only works when the I2C controller is configured as master. If the `I2C_SCL_RST_SLV_EN` bit is set, hardware will send `I2C_SCL_RST_SLV_NUM` SCL pulses, and then automatically clear this bit. When software reads 0 in `I2C_SCL_RST_SLV_EN`, set `I2C_CONF_UPGATE` to stop this function.

25.4.5 Synchronization

I2C registers are configured in APB_CLK domain, whereas the I2C controller is configured in asynchronous I2C_SCLK domain. Therefore, before being used by the I2C controller, register values should be synchronized by first writing configuration registers and then writing 1 to `I2C_CONF_UPGATE`. Registers that need synchronization are listed in Table 25-1.

Table 25-1. I2C Synchronous Registers

Register	Parameter	Address
I2C_CTR_REG	I2C_SLV_TX_AUTO_START_EN	0x0004

I2C_SCL_STOP_HOLD_REG	I2C_SCL_STOP_HOLD_TIME	0x0048
I2C_SCL_STOP_SETUP_REG	I2C_SCL_STOP_SETUP_TIME	0x004C
I2C_SCL_ST_TIME_OUT_REG	I2C_SCL_ST_TO_I2C	0x0078
I2C_SCL_MAIN_ST_TIME_OUT_REG	I2C_SCL_MAIN_ST_TO_I2C	0x007C
I2C_FILTER_CFG_REG	I2C_SCL_FILTER_EN	0x0050
	I2C_SCL_FILTER_THRES	
	I2C_SDA_FILTER_EN	
	I2C_SDA_FILTER_THRES	

25.4.6 Open-Drain Output

SCL and SDA output drivers must be configured as open drain. There are two ways to achieve this:

1. Set `I2C_SCL_FORCE_OUT` and `I2C_SDA_FORCE_OUT`, and configure `GPIO_PIN n _PAD_DRIVER` for corresponding SCL and SDA pads as open-drain.
2. Clear `I2C_SCL_FORCE_OUT` and `I2C_SDA_FORCE_OUT`.

Because these lines are configured as open-drain, the low-to-high transition time of each line is longer, determined together by the pull-up resistor and line capacitance. The output duty cycle of I2C is limited by the SDA and SCL line's pull-up speed, mainly SCL's speed.

In addition, when `I2C_SCL_FORCE_OUT` and `I2C_SCL_PD_EN` are set to 1, SCL can be forced low; when `I2C_SDA_FORCE_OUT` and `I2C_SDA_PD_EN` are set to 1, SDA can be forced low.

25.4.7 Timing Parameter Configuration

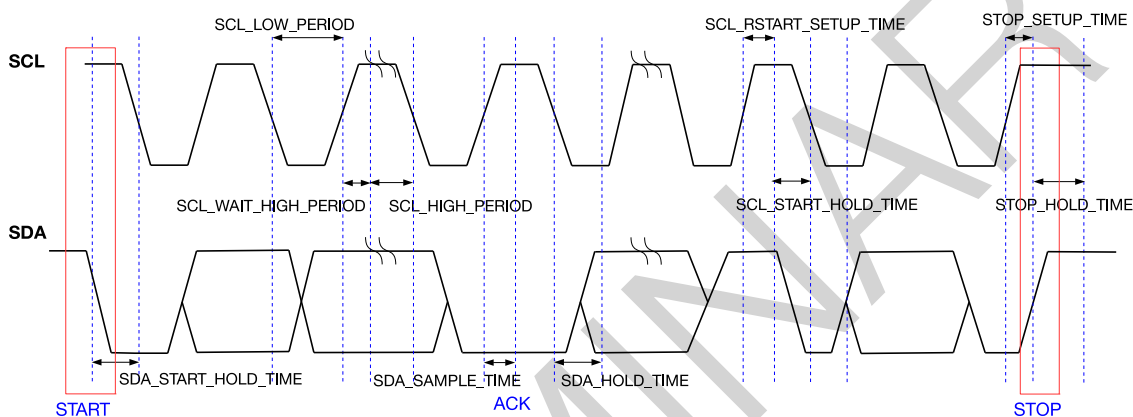

Figure 25-5. I2C Timing Diagram

Figure 25-5 shows the timing diagram of an I2C master. This figure also specifies registers used to configure the START bit, STOP bit, data hold time, data sample time, waiting time on the rising SCL edge, etc. Timing parameters are calculated as follows in I2C_SCLK clock cycles:

1. $t_{LOW} = (I2C_SCL_LOW_PERIOD + 1) \cdot T_{I2C_SCLK}$
2. $t_{HIGH} = (I2C_SCL_HIGH_PERIOD + 1) \cdot T_{I2C_SCLK}$
3. $t_{SU:STA} = (I2C_SCL_RSTART_SETUP_TIME + 1) \cdot T_{I2C_SCLK}$
4. $t_{HD:STA} = (I2C_SCL_START_HOLD_TIME + 1) \cdot T_{I2C_SCLK}$
5. $t_r = (I2C_SCL_WAIT_HIGH_PERIOD + 1) \cdot T_{I2C_SCLK}$
6. $t_{SU:STO} = (I2C_SCL_STOP_SETUP_TIME + 1) \cdot T_{I2C_SCLK}$
7. $t_{BUF} = (I2C_SCL_STOP_HOLD_TIME + 1) \cdot T_{I2C_SCLK}$
8. $t_{HD:DAT} = (I2C_SDA_HOLD_TIME + 1) \cdot T_{I2C_SCLK}$
9. $t_{SU:DAT} = (I2C_SCL_LOW_PERIOD - I2C_SDA_HOLD_TIME) \cdot T_{I2C_SCLK}$

Timing registers below are divided into two groups, depending on the mode in which these registers are active:

- Master mode only:

1. **I2C_SCL_START_HOLD_TIME**: Specifies the interval between pulling SDA low and pulling SCL low when the master generates a START condition. This interval is $(I2C_SCL_START_HOLD_TIME + 1)$ in I2C_SCLK cycles. This register is active only when the I2C controller works in master mode.
2. **I2C_SCL_LOW_PERIOD**: Specifies the low period of SCL. This period lasts $(I2C_SCL_LOW_PERIOD + 1)$ in I2C_SCLK cycles. However, it could be extended when SCL is pulled low by peripheral devices or by an END command executed by the I2C controller, or when the clock is stretched. This register is active only when the I2C controller works in master mode.
3. **I2C_SCL_WAIT_HIGH_PERIOD**: Specifies time for SCL to go high in I2C_SCLK cycles. Please make sure that SCL could be pulled high within this time period. Otherwise, the high period of SCL may be incorrect. This register is active only when the I2C controller works in master mode.
4. **I2C_SCL_HIGH_PERIOD**: Specifies the high period of SCL in I2C_SCLK cycles. This register is active only when the I2C controller works in master mode. When SCL goes high within $(I2C_SCL_WAIT_HIGH_PERIOD + 1)$ in I2C_SCLK cycles, its frequency is:

$$f_{scl} = \frac{f_{I2C_SCLK}}{I2C_SCL_LOW_PERIOD + I2C_SCL_HIGH_PERIOD + I2C_SCL_WAIT_HIGH_PERIOD + 3}$$

- Master mode and slave mode:

1. **I2C_SDA_SAMPLE_TIME**: Specifies the interval between the rising edge of SCL and the level sampling time of SDA. It is advised to set a value in the middle of SCL's high period, so as to correctly sample the level of SCL. This register is active both in master mode and slave mode.
2. **I2C_SDA_HOLD_TIME**: Specifies the interval between changing the SDA output level and the falling edge of SCL. This register is active both in master mode and slave mode.

Timing parameters limits corresponding register configuration.

1. $\frac{f_{I2C_SCLK}}{f_{SCL}} > 20$
2. $3 \times f_{I2C_SCLK} \leq (I2C_SDA_HOLD_TIME - 4) \times f_{APB_CLK}$
3. $I2C_SDA_HOLD_TIME + I2C_SCL_START_HOLD_TIME > SDA_FILTER_THRES + 3$
4. $I2C_SCL_WAIT_HIGH_PERIOD < I2C_SDA_SAMPLE_TIME < I2C_SCL_HIGH_PERIOD$
5. $I2C_SDA_SAMPLE_TIME < I2C_SCL_WAIT_HIGH_PERIOD + I2C_SCL_START_HOLD_TIME + I2C_SCL_RSTART_SETUP_TIME$
6. $I2C_STRETCH_PROTECT_NUM + I2C_SDA_HOLD_TIME > I2C_SCL_LOW_PERIOD$

25.4.8 Timeout Control

The I2C controller has three types of timeout control, namely timeout control for SCL_FSM, for SCL_MAIN_FSM, and for the SCL line. The first two are always enabled, while the third is configurable.

When SCL_FSM remains unchanged for more than $2^{I2C_SCL_ST_TO_I2C}$ clock cycles, an I2C_SCL_ST_TO_INT interrupt is triggered, and then SCL_FSM goes to idle state. The value of I2C_SCL_ST_TO_I2C should be less than or equal to 22, which means SCL_FSM could remain unchanged for 2^{22} I2C_SCLK clock cycles at most before the interrupt is generated.

When SCL_MAIN_FSM remains unchanged for more than $2^{I2C_SCL_MAIN_ST_TO_I2C}$ I2C_SCLK clock cycles, an

I2C_SCL_MAIN_ST_TO_INT interrupt is triggered, and then SCL_MAIN_FSM goes to idle state. The value of I2C_SCL_MAIN_ST_TO_I2C should be less than or equal to 22, which means SCL_MAIN_FSM could remain unchanged for 2^{22} clock cycles at most before the interrupt is generated.

Timeout control for SCL is enabled by setting I2C_TIME_OUT_EN. When the level of SCL remains unchanged for more than I2C_TIME_OUT_VALUE clock cycles, an I2C_TIME_OUT_INT interrupt is triggered, and then the I2C bus goes to idle state.

25.4.9 Command Configuration

When the I2C controller works in master mode, CMD_Controller reads commands from 8 sequential command registers and controls SCL_FSM and SCL_MAIN_FSM accordingly.

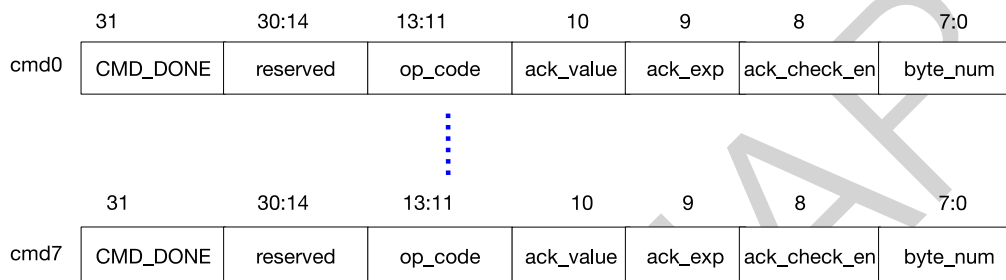

Figure 25-6. Structure of I2C Command Registers

Command registers, whose structure is illustrated in Figure 25-6, are active only when the I2C controller works in master mode. Fields of command registers are:

1. CMD_DONE: Indicates that a command has been executed. After each command has been executed, the CMD_DONE bit in the corresponding command register is set to 1 by hardware. By reading this bit, software can tell if the command has been executed. When writing new commands, this bit must be cleared by software.
2. op_code: Indicates the command. The I2C controller supports five commands:
 - RSTART: op_code = 6. The I2C controller sends a START bit or a RSTART bit defined by the I2C protocol.
 - WRITE: op_code = 1. The I2C controller sends a slave address, a register address (only in double addressing mode) and data to the slave.
 - READ: op_code = 3. The I2C controller reads data from the slave.
 - STOP: op_code = 2. The I2C controller sends a STOP bit defined by the I2C protocol. This code also indicates that the command sequence has been executed, and the CMD_Controller stops reading commands. After restarted by software, the CMD_Controller resumes reading commands from command register 0.
 - END: op_code = 4. The I2C controller pulls the SCL line down and suspends I2C communication. This code also indicates that the command sequence has completed, and the CMD_Controller stops executing commands. Once software refreshes data in command registers and the RAM, the CMD_Controller can be restarted to execute commands from command register 0 again.
3. ack_value: Used to configure the level of the ACK bit sent by the I2C controller during a read operation. This bit is ignored in RSTART, STOP, END and WRITE conditions.

4. `ack_exp`: Used to configure the level of the ACK bit expected by the I2C controller during a write operation. This bit is ignored during RSTART, STOP, END and READ conditions.
5. `ack_check_en`: Used to enable the I2C controller during a write operation to check whether the ACK level sent by the slave matches `ack_exp` in the command. If this bit is set and the level received does not match `ack_exp` in the WRITE command, the master will generate an `I2C_NACK_INT` interrupt and a STOP condition for data transfer. If this bit is cleared, the controller will not check the ACK level sent by the slave. This bit is ignored during RSTART, STOP, END and READ conditions.
6. `byte_num`: Specifies the length of data (in bytes) to be read or written. Can range from 1 to 255 bytes. This bit is ignored during RSTART, STOP and END conditions.

Each command sequence is executed starting from command register 0 and terminated by a STOP or an END. Therefore, there must be a STOP or an END command in the eight command registers.

A complete data transfer on the I2C bus should be initiated by a START and terminated by a STOP. The transfer process may be completed using multiple sequences, separated by END commands. Each sequence may differ in the direction of data transfer, clock frequency, slave addresses, data length, etc. This allows efficient use of available peripheral RAM and also achieves more flexible I2C communication.

25.4.10 TX/RX RAM Data Storage

Both TX RAM and RX RAM are 32×8 bits, and can be accessed in FIFO or non-FIFO mode. If `I2C_NONFIFO_EN` bit is cleared, both RAMs are accessed in FIFO mode; if `I2C_NONFIFO_EN` bit is set, both RAMs are accessed in non-FIFO mode.

TX RAM stores data that the I2C controller needs to send. During communication, when the I2C controller needs to send data (except acknowledgement bits), it reads data from TX RAM and sends them sequentially via SDA. When the I2C controller works in master mode, all data must be stored in TX RAM in the order they will be sent to slaves. The data stored in TX RAM include slave addresses, read/write bits, register addresses (only in double addressing mode) and data to be sent. When the I2C controller works in slave mode, TX RAM only stores data to be sent.

TX RAM can be read and written by the CPU. The CPU writes to TX RAM either in FIFO mode or in non-FIFO mode (direct address). In FIFO mode, the CPU writes to TX RAM via the fixed address `I2C_DATA_REG`, with addresses for writing in TX RAM incremented automatically by hardware. In non-FIFO mode, the CPU accesses TX RAM directly via address fields (`I2C Base Address + 0x100`) ~ (`I2C Base Address + 0x17C`). Each byte in TX RAM occupies an entire word in the address space. Therefore, the address of the first byte is `I2C Base Address + 0x100`, the second byte is `I2C Base Address + 0x104`, the third byte is `I2C Base Address + 0x108`, and so on. The CPU can only read TX RAM via direct addresses. Addresses for reading TX RAM are the same with addresses for writing TX RAM.

RX RAM stores data the I2C controller receives during communication. When the I2C controller works in slave mode, neither slave addresses sent by the master nor register addresses (only in double addressing mode) will be stored into RX RAM. Values of RX RAM can be read by software after I2C communication completes.

RX RAM can only be read by the CPU. The CPU reads RX RAM either in FIFO mode or in non-FIFO mode (direct address). In FIFO mode, the CPU reads RX RAM via the fixed address `I2C_DATA_REG`, with addresses for reading RX RAM incremented automatically by hardware. In non-FIFO mode, the CPU accesses TX RAM directly via address fields (`I2C Base Address + 0x180`) ~ (`I2C Base Address + 0x1FC`). Each byte in RX RAM occupies an entire word in the address space. Therefore, the address of the first byte is `I2C Base Address + 0x180`, the

second byte is [I2C Base Address](#) + 0x184, the third byte is [I2C Base Address](#) + 0x188 and so on.

In FIFO mode, TX RAM of a master may wrap around to send data larger than 32 bytes. Set [I2C_FIFO_PRT_EN](#). If the size of data to be sent is smaller than [I2C_TXFIFO_WM_THRHD](#) (master), an [I2C_TXFIFO_WM_INT](#) (master) interrupt is generated. After receiving the interrupt, software continues writing to [I2C_DATA_REG](#) (master).

Please ensure that software writes to or refreshes TX RAM before the master sends data, otherwise it may result in unpredictable consequences.

In FIFO mode, RX RAM of a slave may also wrap around to receive data larger than 32 bytes. Set [I2C_FIFO_PRT_EN](#) and clear [I2C_RX_FULL_ACK_LEVEL](#). If data already received (to be overwritten) is larger than [I2C_RXFIFO_WM_THRHD](#) (slave), an [I2C_RXFIFO_WM_INT](#) (slave) interrupt is generated. After receiving the interrupt, software continues reading from [I2C_DATA_REG](#) (slave).

25.4.11 Data Conversion

[DATA_Shifter](#) is used for serial/parallel conversion, converting byte data in TX RAM to an outgoing serial bitstream or an incoming serial bitstream to byte data in RX RAM. [I2C_RX_LSB_FIRST](#) and [I2C_TX_LSB_FIRST](#) can be used to select LSB- or MSB-first storage and transmission of data.

25.4.12 Addressing Mode

Besides 7-bit addressing, the ESP32-S3 I2C controller also supports 10-bit addressing and double addressing. 10-bit addressing can be mixed with 7-bit addressing.

Define the slave address as [SLV_ADDR](#). In 7-bit addressing mode, the slave address is [SLV_ADDR\[6:0\]](#); in 10-bit addressing mode, the slave address is [SLV_ADDR\[9:0\]](#).

In 7-bit addressing mode, the master only needs to send one byte of address, which comprises [SLV_ADDR\[6:0\]](#) and a R/\overline{W} bit. In 7-bit addressing mode, there is a special case called general call addressing (broadcast). It is enabled by setting [I2C_ADDR_BROADCASTING_EN](#) in a slave. When the slave receives the general call address (0x00) from the master and the R/\overline{W} bit followed is 0, it responds to the master regardless of its own address.

In 10-bit addressing mode, the master needs to send two bytes of address. The first byte is [slave_addr_first_7bits](#) followed by a R/\overline{W} bit, and [slave_addr_first_7bits](#) should be configured as (0x78 | [SLV_ADDR\[9:8\]](#)). The second byte is [slave_addr_second_byte](#), which should be configured as [SLV_ADDR\[7:0\]](#). The slave can enable 10-bit addressing by configuring [I2C_ADDR_10BIT_EN](#). [I2C_SLAVE_ADDR](#) is used to configure I2C slave address. Specifically, [I2C_SLAVE_ADDR\[14:7\]](#) should be configured as [SLV_ADDR\[7:0\]](#), and [I2C_SLAVE_ADDR\[6:0\]](#) should be configured as (0x78 | [SLV_ADDR\[9:8\]](#)). Since a 10-bit slave address has one more byte than a 7-bit address, [byte_num](#) of the WRITE command and the number of bytes in the RAM increase by one.

When working in slave mode, the I2C controller supports double addressing, where the first address is the address of an I2C slave, and the second one is the slave's memory address. When using double addressing, RAM must be accessed in non-FIFO mode. Double addressing is enabled by setting [I2C_FIFO_ADDR_CFG_EN](#).

25.4.13 R/\overline{W} Bit Check in 10-bit Addressing Mode

In 10-bit addressing mode, when [I2C_ADDR_10BIT_RW_CHECK_EN](#) is set to 1, the I2C controller performs a check on the first byte, which consists of [slave_addr_first_7bits](#) and a R/\overline{W} bit. When the R/\overline{W} bit does not

indicate a WRITE operation, i.e. not in line with the I2C protocol, the data transfer ends. If the check feature is not enabled, when the R/\overline{W} bit does not indicate a WRITE, the data transfer still continues, but transfer failure may occur.

25.4.14 To Start the I2C Controller

To start the I2C controller in master mode, after configuring the controller to master mode and command registers, write 1 to `I2C_TRANS_START` in order that the master starts to parse and execute command sequences. The master always executes a command sequence starting from command register 0 to a STOP or an END at the end. To execute another command sequence starting from command register 0, refresh commands by writing 1 again to `I2C_TRANS_START`.

To start the I2C controller in slave mode, there are two ways:

- Set `I2C_SLV_TX_AUTO_START_EN`, and the slave starts automatic transfer upon an address match;
- Clear `I2C_SLV_TX_AUTO_START_EN`, and always set `I2C_TRANS_START` before transfer.

25.5 Programming Example

This sections provides programming examples for typical communication scenarios. ESP32-S3 has one I2C controller. For the convenience of description, I2C masters and slaves in all subsequent figures are ESP32-S3 I2C controllers. I2C master is referred to as $I2C_{\text{master}}$, and I2C slave is referred to as $I2C_{\text{slave}}$.

25.5.1 $I2C_{\text{master}}$ Writes to $I2C_{\text{slave}}$ with a 7-bit Address in One Command Sequence

25.5.1.1 Introduction

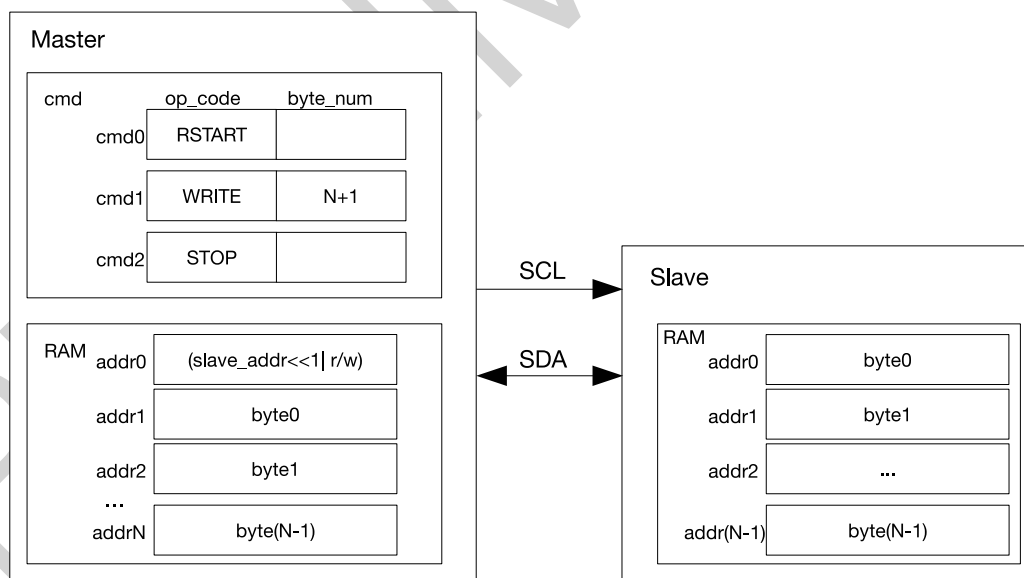

Figure 25-7. $I2C_{\text{master}}$ Writing to $I2C_{\text{slave}}$ with a 7-bit Address

Figure 25-7 shows how $I2C_{\text{master}}$ writes N bytes of data to $I2C_{\text{slave}}$ registers or RAM using 7-bit addressing. As shown in figure 25-7, the first byte in the RAM of $I2C_{\text{master}}$ is a 7-bit $I2C_{\text{slave}}$ address followed by a R/\overline{W} bit. When the R/\overline{W} bit is 0, it indicates a WRITE operation. The remaining bytes are used to store data ready for transfer. The cmd box contains related command sequences.

After the command sequence is configured and data in RAM is ready, I2C_{master} enables the controller and initiates data transfer by setting the I2C_TRANS_START bit. The controller has four steps to take:

1. Wait for SCL to go high, to avoid SCL being used by other masters or slaves.
2. Execute a RSTART command and send a START bit.
3. Execute a WRITE command by taking N+1 bytes from the RAM in order and send them to I2C_{slave} in the same order. The first byte is the address of I2C_{slave}.
4. Send a STOP. Once the I2C_{master} transfers a STOP bit, an I2C_TRANS_COMPLETE_INT interrupt is generated.

25.5.1.2 Configuration Example

1. Configure the timing parameter registers of I2C_{master} and I2C_{slave} according to Section 25.4.7.
2. Set I2C_MS_MODE (master) to 1, and I2C_MS_MODE (slave) to 0.
3. Write 1 to I2C_CONF_UPGATE (master) and I2C_CONF_UPGATE (slave) to synchronize registers.
4. Configure command registers of I2C_{master}.

Command register	op_code	ack_value	ack_exp	ack_check_en	byte_num
I2C_COMMAND0 (master)	RSTART	—	—	—	—
I2C_COMMAND1 (master)	WRITE	ack_value	ack_exp	1	N+1
I2C_COMMAND2 (master)	STOP	—	—	—	—

5. Write the address of I2C_{slave} and data to be sent to TX RAM of I2C_{master} in either FIFO mode or non-FIFO mode according to Section 25.4.10.
6. Write the address of I2C_{slave} to I2C_SLAVE_ADDR (slave) in I2C_SLAVE_ADDR_REG (slave) register.
7. Write 1 to I2C_CONF_UPGATE (master) and I2C_CONF_UPGATE (slave) to synchronize registers.
8. Write 1 to I2C_TRANS_START (master) and I2C_TRANS_START (slave) to start transfer.
9. I2C_{slave} compares the slave address sent by I2C_{master} with its own address in I2C_SLAVE_ADDR (slave). When ack_check_en (master) in I2C_{master}'s WRITE command is 1, I2C_{master} checks ACK value each time it sends a byte. When ack_check_en (master) is 0, I2C_{master} does not check ACK value and take I2C_{slave} as a matching slave by default.
 - Match: If the received ACK value matches ack_exp (master) (the expected ACK value), I2C_{master} continues data transfer.
 - Not match: If the received ACK value does not match ack_exp, I2C_{master} generates an I2C_NACK_INT (master) interrupt and stops data transfer.
10. I2C_{master} sends data, and checks ACK value or not according to ack_check_en (master).
11. If data to be sent (N) is larger than 32 bytes, TX RAM of I2C_{master} may wrap around in FIFO mode. For details, please refer to Section 25.4.10.
12. If data to be received (N) is larger than 32 bytes, RX RAM of I2C_{slave} may wrap around in FIFO mode. For details, please refer to Section 25.4.10.

If data to be received (N) is larger than 32 bytes, the other way is to enable clock stretching by setting the `I2C_SLAVE_SCL_STRETCH_EN` (slave), and clearing `I2C_RX_FULL_ACK_LEVEL`. When RX RAM is full, an `I2C_SLAVE_STRETCH_INT` (slave) interrupt is generated. In this way, $I2C_{slave}$ can hold SCL low, in exchange for more time to read data. After software has finished reading, you can set `I2C_SLAVE_STRETCH_INT_CLR` (slave) to 1 to clear interrupt, and set `I2C_SLAVE_SCL_STRETCH_CLR` (slave) to release the SCL line.

- After data transfer completes, $I2C_{master}$ executes the STOP command, and generates an `I2C_TRANS_COMPLETE_INT` (master) interrupt.

25.5.2 $I2C_{master}$ Writes to $I2C_{slave}$ with a 10-bit Address in One Command Sequence

25.5.2.1 Introduction

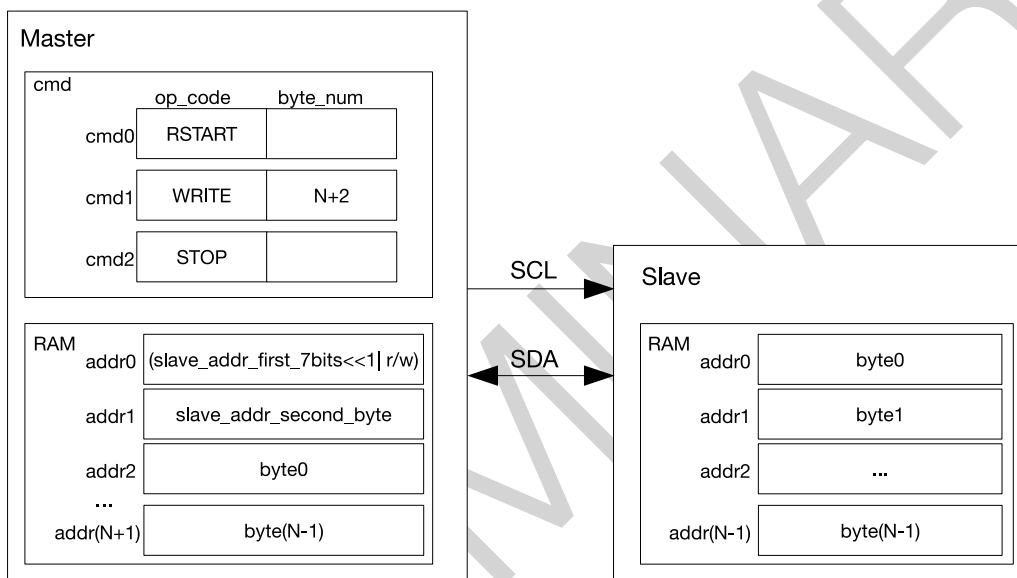

Figure 25-8. $I2C_{master}$ Writing to a Slave with a 10-bit Address

Figure 25-8 shows how $I2C_{master}$ writes N bytes of data using 10-bit addressing to an I2C slave. The configuration and transfer process is similar to what is described in 25.5.1, except that a 10-bit $I2C_{slave}$ address is formed from two bytes. Since a 10-bit $I2C_{slave}$ address has one more byte than a 7-bit $I2C_{slave}$ address, `byte_num` and length of data in TX RAM increase by 1 accordingly.

25.5.2.2 Configuration Example

- Set `I2C_MS_MODE` (master) to 1, and `I2C_MS_MODE` (slave) to 0.
- Write 1 to `I2C_CONF_UPGATE` (master) and `I2C_CONF_UPGATE` (slave) to synchronize registers.
- Configure command registers of $I2C_{master}$.

Command registers	op_code	ack_value	ack_exp	ack_check_en	byte_num
<code>I2C_COMMAND0</code> (master)	RSTART	—	—	—	—
<code>I2C_COMMAND1</code> (master)	WRITE	ack_value	ack_exp	1	N+2
<code>I2C_COMMAND2</code> (master)	STOP	—	—	—	—

4. Configure `I2C_SLAVE_ADDR` (slave) in `I2C_SLAVE_ADDR_REG` (slave) as `I2C_slave`'s 10-bit address, and set `I2C_ADDR_10BIT_EN` (slave) to 1 to enable 10-bit addressing.
5. Write the address of `I2C_slave` and data to be sent to TX RAM of `I2C_master`. The first byte of the address of `I2C_slave` comprises $((0x78 | I2C_SLAVE_ADDR[9:8]) \ll 1)$ and a R/\overline{W} bit. The second byte of the address of `I2C_slave` is `I2C_SLAVE_ADDR[7:0]`. These two bytes are followed by data to be sent in FIFO or non-FIFO mode.
6. Write 1 to `I2C_CONF_UPGATE` (master) and `I2C_CONF_UPGATE` (slave) to synchronize registers.
7. Write 1 to `I2C_TRANS_START` (master) and `I2C_TRANS_START` (slave) to start transfer.
8. `I2C_slave` compares the slave address sent by `I2C_master` with its own address in `I2C_SLAVE_ADDR` (slave). When `ack_check_en` (master) in `I2C_master`'s WRITE command is 1, `I2C_master` checks ACK value each time it sends a byte. When `ack_check_en` (master) is 0, `I2C_master` does not check ACK value and take `I2C_slave` as matching slave by default.
 - Match: If the received ACK value matches `ack_exp` (master) (the expected ACK value), `I2C_master` continues data transfer.
 - Not match: If the received ACK value does not match `ack_exp`, `I2C_master` generates an `I2C_NACK_INT` (master) interrupt and stops data transfer.
9. `I2C_master` sends data, and checks ACK value or not according to `ack_check_en` (master).
10. If data to be sent is larger than 32 bytes, TX RAM of `I2C_master` may wrap around in FIFO mode. For details, please refer to Section 25.4.10.
11. If data to be received is larger than 32 bytes, RX RAM of `I2C_slave` may wrap around in FIFO mode. For details, please refer to Section 25.4.10.

If data to be received is larger than 32 bytes, the other way is to enable clock stretching by setting `I2C_SLAVE_SCL_STRETCH_EN` (slave), and clearing `I2C_RX_FULL_ACK_LEVEL` to 0. When RX RAM is full, an `I2C_SLAVE_STRETCH_INT` (slave) interrupt is generated. In this way, `I2C_slave` can hold SCL low, in exchange for more time to read data. After software has finished reading, you can set `I2C_SLAVE_STRETCH_INT_CLR` (slave) to 1 to clear interrupt, and set `I2C_SLAVE_SCL_STRETCH_CLR` (slave) to release the SCL line.
12. After data transfer completes, `I2C_master` executes the STOP command, and generates an `I2C_TRANS_COMPLETE_INT` (master) interrupt.

25.5.3 `I2C_master` Writes to `I2C_slave` with Two 7-bit Addresses in One Command Sequence

25.5.3.1 Introduction

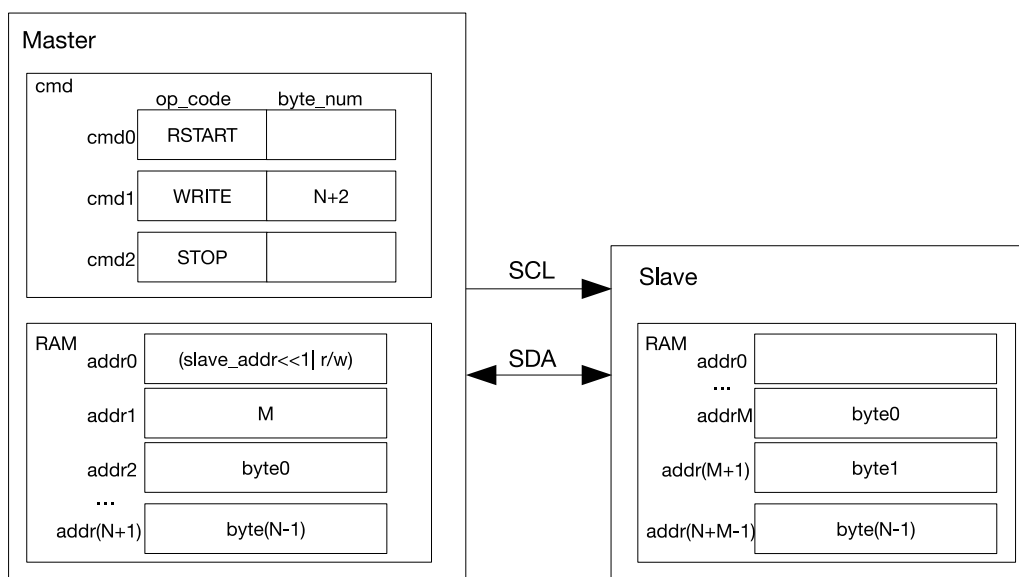

Figure 25-9. I2C_{master} Writing to I2C_{slave} with Two 7-bit Addresses

Figure 25-9 shows how I2C_{master} writes N bytes of data to I2C_{slave} registers or RAM using 7-bit double addressing. The configuration and transfer process is similar to what is described in Section 25.5.1, except that in 7-bit double addressing mode I2C_{master} sends two 7-bit addresses. The first address is the address of an I2C slave, and the second one is I2C_{slave}'s memory address (i.e. addrM in Figure 25-9). When using double addressing, RAM must be accessed in non-FIFO mode. The I2C slave put received byte0 ~ byte(N-1) into its RAM in an order starting from addrM. The RAM is overwritten every 32 bytes.

25.5.3.2 Configuration Example

1. Set `I2C_MS_MODE` (master) to 1, and `I2C_MS_MODE` (slave) to 0.
2. Set `I2C_FIFO_ADDR_CFG_EN` (slave) to 1 to enable double addressing mode.
3. Write 1 to `I2C_CONF_UPGATE` (master) and `I2C_CONF_UPGATE` (slave) to synchronize registers.
4. Configure command registers of I2C_{master}.

Command registers	op_code	ack_value	ack_exp	ack_check_en	byte_num
<code>I2C_COMMAND0</code> (master)	RSTART	—	—	—	—
<code>I2C_COMMAND1</code> (master)	WRITE	ack_value	ack_exp	1	N+2
<code>I2C_COMMAND2</code> (master)	STOP	—	—	—	—

5. Write the address of I2C_{slave} and data to be sent to TX RAM of I2C_{master} in FIFO or non-FIFO mode.
6. Write the address of I2C_{slave} to `I2C_SLAVE_ADDR` (slave) in `I2C_SLAVE_ADDR_REG` (slave) register.
7. Write 1 to `I2C_CONF_UPGATE` (master) and `I2C_CONF_UPGATE` (slave) to synchronize registers.
8. Write 1 to `I2C_TRANS_START` (master) and `I2C_TRANS_START` (slave) to start transfer.
9. I2C_{slave} compares the slave address sent by I2C_{master} with its own address in `I2C_SLAVE_ADDR` (slave).

When `ack_check_en` (master) in `I2Cmaster`'s WRITE command is 1, `I2Cmaster` checks ACK value each time it sends a byte. When `ack_check_en` (master) is 0, `I2Cmaster` does not check ACK value and take `I2Cslave` as matching slave by default.

- Match: If the received ACK value matches `ack_exp` (master) (the expected ACK value), `I2Cmaster` continues data transfer.
 - Not match: If the received ACK value does not match `ack_exp`, `I2Cmaster` generates an `I2C_NACK_INT` (master) interrupt and stops data transfer.
10. `I2Cslave` receives the RX RAM address sent by `I2Cmaster` and adds the offset.
 11. `I2Cmaster` sends data, and checks ACK value or not according to `ack_check_en` (master).
 12. If data to be sent is larger than 32 bytes, TX RAM of `I2Cmaster` may wrap around in FIFO mode. For details, please refer to Section 25.4.10.
 13. If data to be received is larger than 32 bytes, you may enable clock stretching by setting `I2C_SLAVE_SCL_STRETCH_EN` (slave), and clearing `I2C_RX_FULL_ACK_LEVEL` to 0. When RX RAM is full, an `I2C_SLAVE_STRETCH_INT` (slave) interrupt is generated. In this way, `I2Cslave` can hold SCL low, in exchange for more time to read data. After software has finished reading, you can set `I2C_SLAVE_STRETCH_INT_CLR` (slave) to 1 to clear interrupt, and set `I2C_SLAVE_SCL_STRETCH_CLR` (slave) to release the SCL line.
 14. After data transfer completes, `I2Cmaster` executes the STOP command, and generates an `I2C_TRANS_COMPLETE_INT` (master) interrupt.

25.5.4 `I2Cmaster` Writes to `I2Cslave` with a 7-bit Address in Multiple Command Sequences

25.5.4.1 Introduction

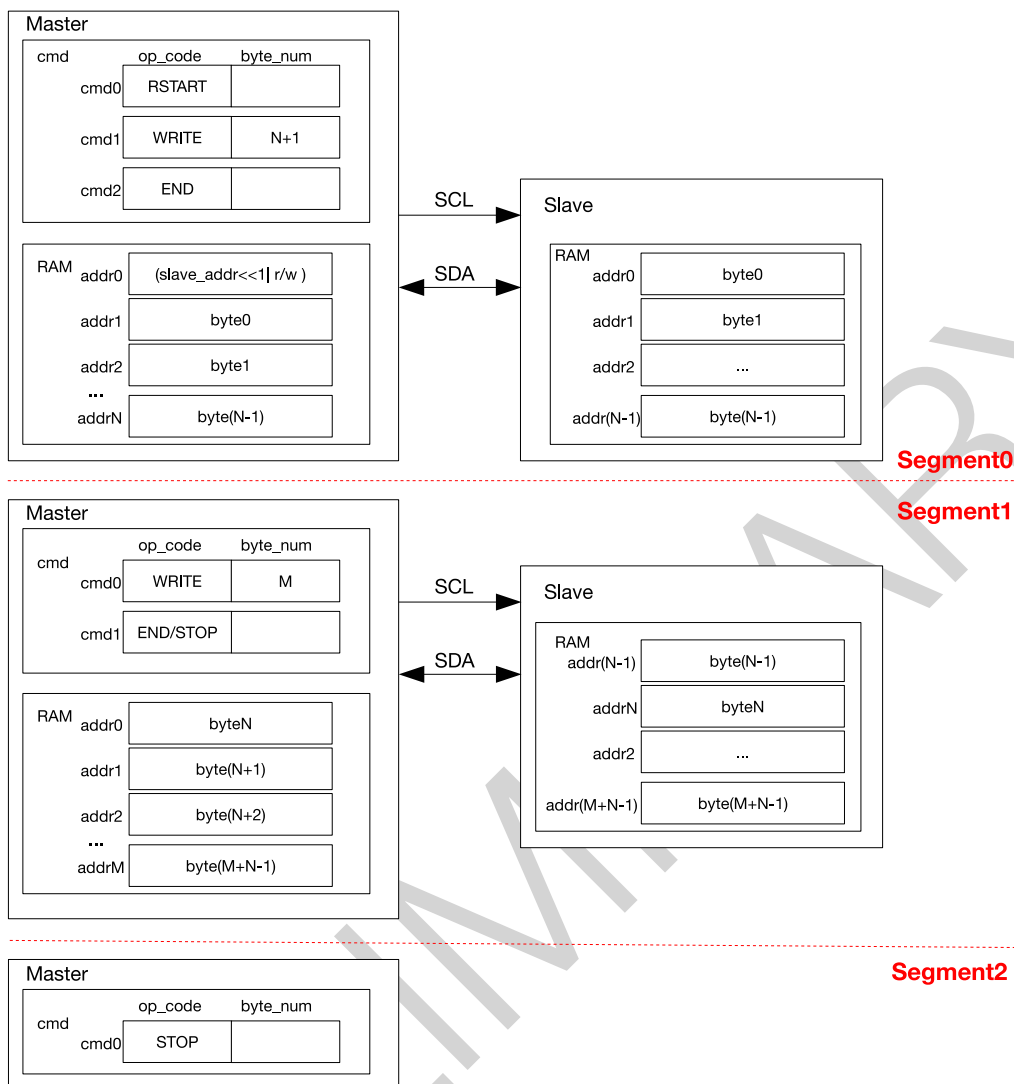

Figure 25-10. I2C_{master} Writing to I2C_{slave} with a 7-bit Address in Multiple Sequences

Given that the I2C Controller RAM holds only 32 bytes, when data are too large to be processed even by the wrapped RAM, it is advised to transmit them in multiple command sequences. At the end of every command sequence is an END command. When the controller executes this END command to pull SCL low, software refreshes command sequence registers and the RAM for next the transfer.

Figure 25-10 shows how I2C_{master} writes to an I2C slave in two or three segments as an example. For the first segment, the CMD_Controller registers are configured as shown in Segment0. Once data in I2C_{master}'s RAM is ready and I2C_TRANS_START is set, I2C_{master} initiates data transfer. After executing the END command, I2C_{master} turns off the SCL clock and pulls SCL low to reserve the bus. Meanwhile, the controller generates an I2C_END_DETECT_INT interrupt.

For the second segment, after detecting the I2C_END_DETECT_INT interrupt, software refreshes the CMD_Controller registers, reloads the RAM and clears this interrupt, as shown in Segment1. If cmd1 in the second segment is a STOP, then data is transmitted to I2C_{slave} in two segments. I2C_{master} resumes data transfer after I2C_TRANS_START is set, and terminates the transfer by sending a STOP bit.

For the third segment, after the second data transfer finishes and an `I2C_END_DETECT_INT` is detected, the `CMD_Controller` registers of `I2Cmaster` are configured as shown in Segment2. Once `I2C_TRANS_START` is set, `I2Cmaster` generates a STOP bit and terminates the transfer.

Note that other `I2Cmaster`s will not transact on the bus between two segments. The bus is only released after a STOP signal is sent. The I2C controller can be reset by setting `I2C_FSM_RST` field at any time. This field will later be cleared automatically by hardware.

25.5.4.2 Configuration Example

1. Set `I2C_MS_MODE` (master) to 1, and `I2C_MS_MODE` (slave) to 0.
2. Write 1 to `I2C_CONF_UPGATE` (master) and `I2C_CONF_UPGATE` (slave) to synchronize registers.
3. Configure command registers of `I2Cmaster`.

Command registers	op_code	ack_value	ack_exp	ack_check_en	byte_num
<code>I2C_COMMAND0</code> (master)	RSTART	—	—	—	—
<code>I2C_COMMAND1</code> (master)	WRITE	ack_value	ack_exp	1	N+1
<code>I2C_COMMAND2</code> (master)	END	—	—	—	—

4. Write the address of `I2Cslave` and data to be sent to TX RAM of `I2Cmaster` in either FIFO mode or non-FIFO mode according to Section 25.4.10.
5. Write the address of `I2Cslave` to `I2C_SLAVE_ADDR` (slave) in `I2C_SLAVE_ADDR_REG` (slave) register
6. Write 1 to `I2C_CONF_UPGATE` (master) and `I2C_CONF_UPGATE` (slave) to synchronize registers.
7. Write 1 to `I2C_TRANS_START` (master) and `I2C_TRANS_START` (slave) to start transfer.
8. `I2Cslave` compares the slave address sent by `I2Cmaster` with its own address in `I2C_SLAVE_ADDR` (slave). When `ack_check_en` (master) in `I2Cmaster`'s WRITE command is 1, `I2Cmaster` checks ACK value each time it sends a byte. When `ack_check_en` (master) is 0, `I2Cmaster` does not check ACK value and take `I2Cslave` as matching slave by default.
 - Match: If the received ACK value matches `ack_exp` (master) (the expected ACK value), `I2Cmaster` continues data transfer.
 - Not match: If the received ACK value does not match `ack_exp`, `I2Cmaster` generates an `I2C_NACK_INT` (master) interrupt and stops data transfer.
9. `I2Cmaster` sends data, and checks ACK value or not according to `ack_check_en` (master).
10. After the `I2C_END_DETECT_INT` (master) interrupt is generated, set `I2C_END_DETECT_INT_CLR` (master) to 1 to clear this interrupt.
11. Update `I2Cmaster`'s command registers.

Command registers	op_code	ack_value	ack_exp	ack_check_en	byte_num
<code>I2C_COMMAND0</code> (master)	WRITE	ack_value	ack_exp	1	M
<code>I2C_COMMAND1</code> (master)	END/STOP	—	—	—	—

12. Write M bytes of data to be sent to TX RAM of `I2Cmaster` in FIFO or non-FIFO mode.

13. Write 1 to `I2C_TRANS_START` (master) bit to start transfer and repeat step 9.
14. If the command is a STOP, I2C stops transfer and generates an `I2C_TRANS_COMPLETE_INT` (master) interrupt.
15. If the command is an END, repeat step 10.
16. Update `I2Cmaster`'s command registers.

Command registers of <code>I2C_{master}</code>	op_code	ack_value	ack_exp	ack_check_en	byte_num
<code>I2C_COMMAND1</code> (master)	STOP	—	—	—	—

17. Write 1 to `I2C_TRANS_START` (master) bit to start transfer.
18. `I2Cmaster` executes the STOP command and generates an `I2C_TRANS_COMPLETE_INT` (master) interrupt.

25.5.5 `I2Cmaster` Reads `I2Cslave` with a 7-bit Address in One Command Sequence

25.5.5.1 Introduction

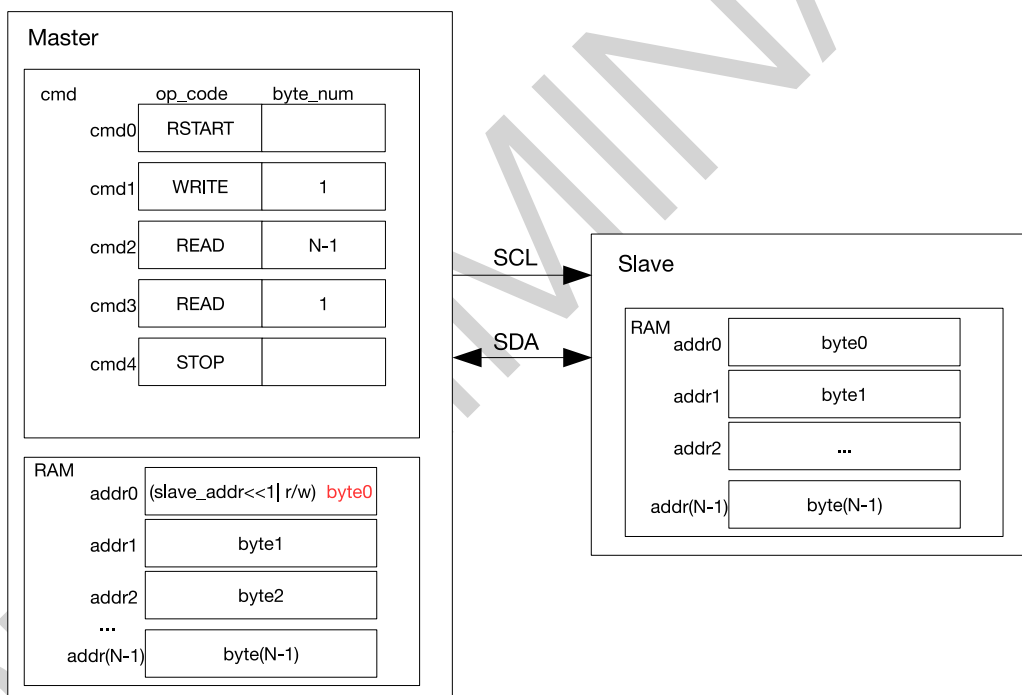

Figure 25-11. `I2Cmaster` Reading `I2Cslave` with a 7-bit Address

Figure 25-11 shows how `I2Cmaster` reads N bytes of data from an `I2Cslave` using 7-bit addressing. `cmd1` is a WRITE command, and when this command is executed `I2Cmaster` sends the address of `I2Cslave`. The byte sent comprises a 7-bit `I2Cslave` address and a R/\overline{W} bit. When the R/\overline{W} bit is 1, it indicates a READ operation. If the address of an `I2Cslave` matches the sent address, this matching slave starts sending data to `I2Cmaster`. `I2Cmaster` generates acknowledgements according to `ack_value` defined in the READ command upon receiving a byte.

As illustrated in Figure 25-11, `I2Cmaster` executes two READ commands: it generates ACKs for $(N-1)$ bytes of data in `cmd2`, and a NACK for the last byte of data in `cmd3`. This configuration may be changed as required.

I2C_{master} writes received data into the controller RAM from addr0, whose original content (a the address of I2C_{slave} and a R/\overline{W} bit) is overwritten by byte0 marked red in Figure 25-11.

25.5.5.2 Configuration Example

1. Set I2C_MS_MODE (master) to 1, and I2C_MS_MODE (slave) to 0.
2. We recommend setting I2C_SLAVE_SCL_STRETCH_EN (slave) to 1, so that SCL can be held low for more processing time when I2C_{slave} needs to send data. If this bit is not set, software should write data to be sent to I2C_{slave}'s TX RAM before I2C_{master} initiates transfer. Configuration below is applicable to scenario where I2C_SLAVE_SCL_STRETCH_EN (slave) is 1.
3. Write 1 to I2C_CONF_UPGATE (master) and I2C_CONF_UPGATE (slave) to synchronize registers.
4. Configure command registers of I2C_{master}.

Command registers of I2C _{master}	op_code	ack_value	ack_exp	ack_check_en	byte_num
I2C_COMMAND0 (master)	RSTART	—	—	—	—
I2C_COMMAND1 (master)	WRITE	0	0	1	1
I2C_COMMAND2 (master)	READ	0	0	1	N-1
I2C_COMMAND3 (master)	READ	1	0	1	1
I2C_COMMAND4 (master)	STOP	—	—	—	—

5. Write the address of I2C_{slave} to TX RAM of I2C_{master} in either FIFO mode or non-FIFO mode according to Section 25.4.10.
6. Write the address of I2C_{slave} to I2C_SLAVE_ADDR (slave) in I2C_SLAVE_ADDR_REG (slave) register.
7. Write 1 to I2C_CONF_UPGATE (master) and I2C_CONF_UPGATE (slave) to synchronize registers.
8. Write 1 to I2C_TRANS_START (master) bit to start I2C_{master}'s transfer.
9. Start I2C_{slave}'s transfer according to Section 25.4.14.
10. I2C_{slave} compares the slave address sent by I2C_{master} with its own address in I2C_SLAVE_ADDR (slave). When ack_check_en (master) in I2C_{master}'s WRITE command is 1, I2C_{master} checks ACK value each time it sends a byte. When ack_check_en (master) is 0, I2C_{master} does not check ACK value and take I2C_{slave} as matching slave by default.
 - Match: If the received ACK value matches ack_exp (master) (the expected ACK value), I2C_{master} continues data transfer.
 - Not match: If the received ACK value does not match ack_exp, I2C_{master} generates an I2C_NACK_INT (master) interrupt and stops data transfer.
11. After I2C_SLAVE_STRETCH_INT (slave) is generated, the I2C_STRETCH_CAUSE bit is 0. The address of I2C_{slave} matches the address sent over SDA, and I2C_{slave} needs to send data.
12. Write data to be sent to TX RAM of I2C_{slave} in either FIFO mode or non-FIFO mode according to Section 25.4.10.
13. Set I2C_SLAVE_SCL_STRETCH_CLR (slave) to 1 to release SCL.

14. I2C_{slave} sends data, and I2C_{master} checks ACK value or not according to ack_check_en (master) in the READ command.
15. If data to be read by I2C_{master} is larger than 32 bytes, an I2C_SLAVE_STRETCH_INT (slave) interrupt will be generated when TX RAM of I2C_{slave} becomes empty. In this way, I2C_{slave} can hold SCL low, so that software has more time to pad data in TX RAM of I2C_{slave} and read data in RX RAM of I2C_{master}. After software has finished reading, you can set I2C_SLAVE_STRETCH_INT_CLR (slave) to 1 to clear interrupt, and set I2C_SLAVE_SCL_STRETCH_CLR (slave) to release the SCL line.
16. After I2C_{master} has received the last byte of data, set ack_value (master) to 1. I2C_{slave} will stop transfer once receiving the I2C_NACK_INT interrupt.
17. After data transfer completes, I2C_{master} executes the STOP command, and generates an I2C_TRANS_COMPLETE_INT (master) interrupt.

25.5.6 I2C_{master} Reads I2C_{slave} with a 10-bit Address in One Command Sequence

25.5.6.1 Introduction

Figure 25-12. I2C_{master} Reading I2C_{slave} with a 10-bit Address

Figure 25-12 shows how I2C_{master} reads data from an I2C slave using 10-bit addressing. Unlike 7-bit addressing, in 10-bit addressing the WRITE command of the I2C_{master} is formed from two bytes, and correspondingly TX RAM of this master stores a 10-bit address of two bytes. The R/\overline{W} bit in the first byte is 0, which indicates a WRITE operation. After a RSTART condition, I2C_{master} sends the first byte of address again to read data from I2C_{slave}, but the R/\overline{W} bit is 1, which indicates a READ operation. The two address bytes can be configured as described in Section 25.5.2.

25.5.6.2 Configuration Example

1. Set `I2C_MS_MODE` (master) to 1, and `I2C_MS_MODE` (slave) to 0.
2. We recommend setting `I2C_SLAVE_SCL_STRETCH_EN` (slave) to 1, so that SCL can be held low for more processing time when `I2C_slave` needs to send data. If this bit is not set, software should write data to be sent to `I2C_slave`'s TX RAM before `I2C_master` initiates transfer. Configuration below is applicable to scenario where `I2C_SLAVE_SCL_STRETCH_EN` (slave) is 1.
3. Write 1 to `I2C_CONF_UPGATE` (master) and `I2C_CONF_UPGATE` (slave) to synchronize registers.
4. Configure command registers of `I2C_master`.

Command registers of <code>I2C_master</code>	op_code	ack_value	ack_exp	ack_check_en	byte_num
<code>I2C_COMMAND0</code> (master)	RSTART	—	—	—	—
<code>I2C_COMMAND1</code> (master)	WRITE	0	0	1	2
<code>I2C_COMMAND2</code> (master)	RSTART	—	—	—	—
<code>I2C_COMMAND3</code> (master)	WRITE	0	0	1	1
<code>I2C_COMMAND4</code> (master)	READ	0	0	1	N-1
<code>I2C_COMMAND5</code> (master)	READ	1	0	1	1
<code>I2C_COMMAND6</code> (master)	STOP	—	—	—	—

5. Configure `I2C_SLAVE_ADDR` (slave) in `I2C_SLAVE_ADDR_REG` (slave) as `I2C_slave`'s 10-bit address, and set `I2C_ADDR_10BIT_EN` (slave) to 1 to enable 10-bit addressing.
6. Write the address of `I2C_slave` and data to be sent to TX RAM of `I2C_master` in either FIFO or non-FIFO mode. The first byte of address comprises $((0x78 | I2C_SLAVE_ADDR[9:8]) \ll 1)$ and a R/\overline{W} bit, which is 1 and indicates a WRITE operation. The second byte of address is `I2C_SLAVE_ADDR[7:0]`. The third byte is $((0x78 | I2C_SLAVE_ADDR[9:8]) \ll 1)$ and a R/\overline{W} bit, which is 1 and indicates a READ operation.
7. Write 1 to `I2C_CONF_UPGATE` (master) and `I2C_CONF_UPGATE` (slave) to synchronize registers.
8. Write 1 to `I2C_TRANS_START` (master) to start `I2C_master`'s transfer.
9. Start `I2C_slave`'s transfer according to Section 25.4.14.
10. `I2C_slave` compares the slave address sent by `I2C_master` with its own address in `I2C_SLAVE_ADDR` (slave). When `ack_check_en` (master) in `I2C_master`'s WRITE command is 1, `I2C_master` checks ACK value each time it sends a byte. When `ack_check_en` (master) is 0, `I2C_master` does not check ACK value and take `I2C_slave` as matching slave by default.
 - Match: If the received ACK value matches `ack_exp` (master) (the expected ACK value), `I2C_master` continues data transfer.
 - Not match: If the received ACK value does not match `ack_exp`, `I2C_master` generates an `I2C_NACK_INT` (master) interrupt and stops data transfer.
11. `I2C_master` sends a RSTART and the third byte in TX RAM, which is $((0x78 | I2C_SLAVE_ADDR[9:8]) \ll 1)$ and a R/\overline{W} bit that indicates READ.
12. `I2C_slave` repeats step 10. If its address matches the address sent by `I2C_master`, `I2C_slave` proceed on to the next steps.

13. After `I2C_SLAVE_STRETCH_INT` (slave) is generated, the `I2C_STRETCH_CAUSE` bit is 0. The address of `I2C_slave` matches the address sent over SDA, and `I2C_slave` needs to send data.
14. Write data to be sent to TX RAM of `I2C_slave` in either FIFO mode or non-FIFO mode according to Section 25.4.10.
15. Set `I2C_SLAVE_SCL_STRETCH_CLR` (slave) to 1 to release SCL.
16. `I2C_slave` sends data, and `I2C_master` checks ACK value or not according to `ack_check_en` (master) in the READ command.
17. If data to be read by `I2C_master` is larger than 32 bytes, an `I2C_SLAVE_STRETCH_INT` (slave) interrupt will be generated when TX RAM of `I2C_slave` becomes empty. In this way, `I2C_slave` can hold SCL low, so that software has more time to pad data in TX RAM of `I2C_slave` and read data in RX RAM of `I2C_master`. After software has finished reading, you can set `I2C_SLAVE_STRETCH_INT_CLR` (slave) to 1 to clear interrupt, and set `I2C_SLAVE_SCL_STRETCH_CLR` (slave) to release the SCL line.
18. After `I2C_master` has received the last byte of data, set `ack_value` (master) to 1. `I2C_slave` will stop transfer once receiving the `I2C_NACK_INT` interrupt.
19. After data transfer completes, `I2C_master` executes the STOP command, and generates an `I2C_TRANS_COMPLETE_INT` (master) interrupt.

25.5.7 I2C_{master} Reads I2C_{slave} with Two 7-bit Addresses in One Command Sequence

25.5.7.1 Introduction

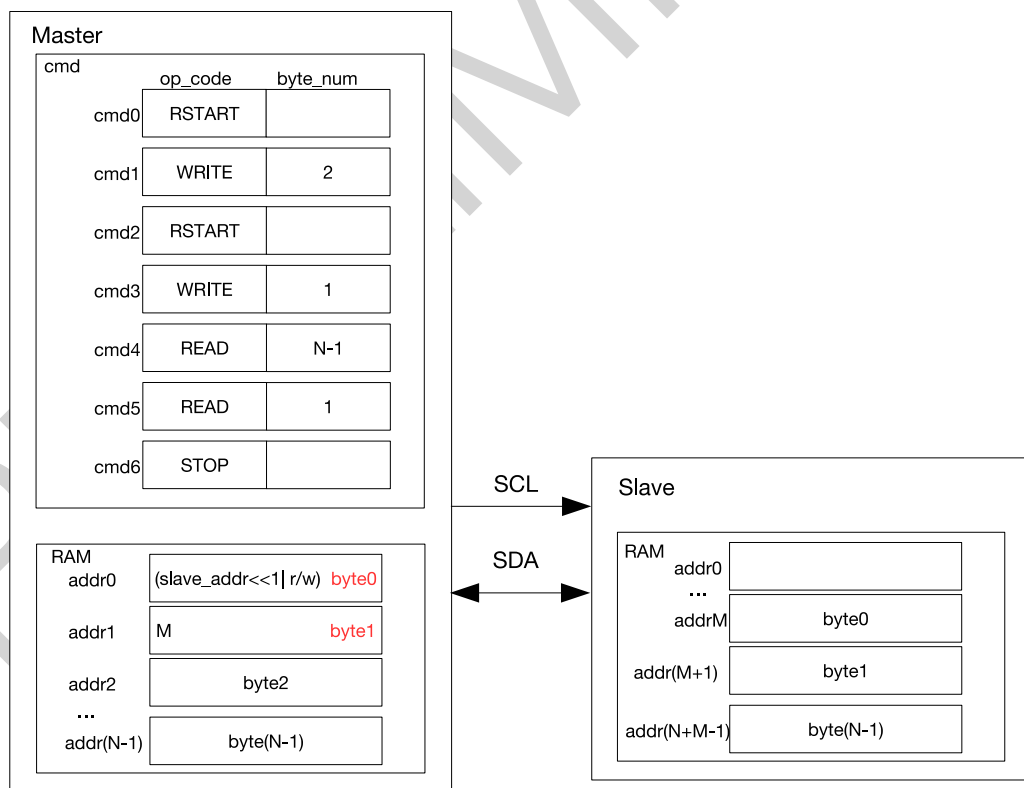

Figure 25-13. I2C_{master} Reading N Bytes of Data from `addrM` of I2C_{slave} with a 7-bit Address

Figure 25-13 shows how I2C_{master} reads data from specified addresses in an I2C slave. I2C_{master} sends two bytes of addresses: the first byte is a 7-bit I2C_{slave} address followed by a R/\overline{W} bit, which is 0 and indicates a WRITE; the second byte is I2C_{slave}'s memory address. After a RSTART condition, I2C_{master} sends the first byte of address again, but the R/\overline{W} bit is 1 which indicates a READ. Then, I2C_{master} reads data starting from addrM.

25.5.7.2 Configuration Example

1. Set I2C_MS_MODE (master) to 1, and I2C_MS_MODE (slave) to 0.
2. We recommend setting I2C_SLAVE_SCL_STRETCH_EN (slave) to 1, so that SCL can be held low for more processing time when I2C_{slave} needs to send data. If this bit is not set, software should write data to be sent to I2C_{slave}'s TX RAM before I2C_{master} initiates transfer. Configuration below is applicable to scenario where I2C_SLAVE_SCL_STRETCH_EN (slave) is 1.
3. Set I2C_FIFO_ADDR_CFG_EN (slave) to 1 to enable double addressing mode.
4. Write 1 to I2C_CONF_UPGATE (master) and I2C_CONF_UPGATE (slave) to synchronize registers.
5. Configure command registers of I2C_{master}.

Command registers of I2C _{master}	op_code	ack_value	ack_exp	ack_check_en	byte_num
I2C_COMMAND0 (master)	RSTART	—	—	—	—
I2C_COMMAND1 (master)	WRITE	0	0	1	2
I2C_COMMAND2 (master)	RSTART	—	—	—	—
I2C_COMMAND3 (master)	WRITE	0	0	1	1
I2C_COMMAND4 (master)	READ	0	0	1	N-1
I2C_COMMAND5 (master)	READ	1	0	1	1
I2C_COMMAND6 (master)	STOP	—	—	—	—

6. Configure I2C_SLAVE_ADDR (slave) in I2C_SLAVE_ADDR_REG (slave) register as I2C_{slave}'s 7-bit address, and set I2C_ADDR_10BIT_EN (slave) to 0 to enable 7-bit addressing.
7. Write the address of I2C_{slave} and data to be sent to TX RAM of I2C_{master} in either FIFO or non-FIFO mode according to Section 25.4.10. The first byte of address comprises (I2C_SLAVE_ADDR[6:0]) < 1 and a R/\overline{W} bit, which is 0 and indicates a WRITE. The second byte of address is memory address M of I2C_{slave}. The third byte is (I2C_SLAVE_ADDR[6:0]) < 1 and a R/\overline{W} bit, which is 1 and indicates a READ.
8. Write 1 to I2C_CONF_UPGATE (master) and I2C_CONF_UPGATE (slave) to synchronize registers.
9. Write 1 to I2C_TRANS_START (master) to start I2C_{master}'s transfer.
10. Start I2C_{slave}'s transfer according to Section 25.4.14.
11. I2C_{slave} compares the slave address sent by I2C_{master} with its own address in I2C_SLAVE_ADDR (slave). When ack_check_en (master) in I2C_{master}'s WRITE command is 1, I2C_{master} checks ACK value each time it sends a byte. When ack_check_en (master) is 0, I2C_{master} does not check ACK value and take I2C_{slave} as matching slave by default.
 - Match: If the received ACK value matches ack_exp (master) (the expected ACK value), I2C_{master} continues data transfer.

- Not match: If the received ACK value does not match `ack_exp`, `I2C_master` generates an `I2C_NACK_INT` (master) interrupt and stops data transfer.
12. `I2C_slave` receives memory address sent by `I2C_master` and adds the offset.
 13. `I2C_master` sends a RSTART and the third byte in TX RAM, which is $((0x78 | I2C_SLAVE_ADDR[9:8]) \ll 1)$ and a R bit.
 14. `I2C_slave` repeats step 11. If its address matches the address sent by `I2C_master`, `I2C_slave` proceed on to the next steps.
 15. After `I2C_SLAVE_STRETCH_INT` (slave) is generated, the `I2C_STRETCH_CAUSE` bit is 0. The address of `I2C_slave` matches the address sent over SDA, and `I2C_slave` needs to send data.
 16. Write data to be sent to TX RAM of `I2C_slave` in either FIFO mode or non-FIFO mode according to Section 25.4.10.
 17. Set `I2C_SLAVE_SCL_STRETCH_CLR` (slave) to 1 to release SCL.
 18. `I2C_slave` sends data, and `I2C_master` checks ACK value or not according to `ack_check_en` (master) in the READ command.
 19. If data to be read by `I2C_master` is larger than 32 bytes, an `I2C_SLAVE_STRETCH_INT` (slave) interrupt will be generated when TX RAM of `I2C_slave` becomes empty. In this way, `I2C_slave` can hold SCL low, so that software has more time to pad data in TX RAM of `I2C_slave` and read data in RX RAM of `I2C_master`. After software has finished reading, you can set `I2C_SLAVE_STRETCH_INT_CLR` (slave) to 1 to clear interrupt, and set `I2C_SLAVE_SCL_STRETCH_CLR` (slave) to release the SCL line.
 20. After `I2C_master` has received the last byte of data, set `ack_value` (master) to 1. `I2C_slave` will stop transfer once receiving the `I2C_NACK_INT` interrupt.
 21. After data transfer completes, `I2C_master` executes the STOP command, and generates an `I2C_TRANS_COMPLETE_INT` (master) interrupt.

25.5.8 `I2C_master` Reads `I2C_slave` with a 7-bit Address in Multiple Command Sequences

25.5.8.1 Introduction

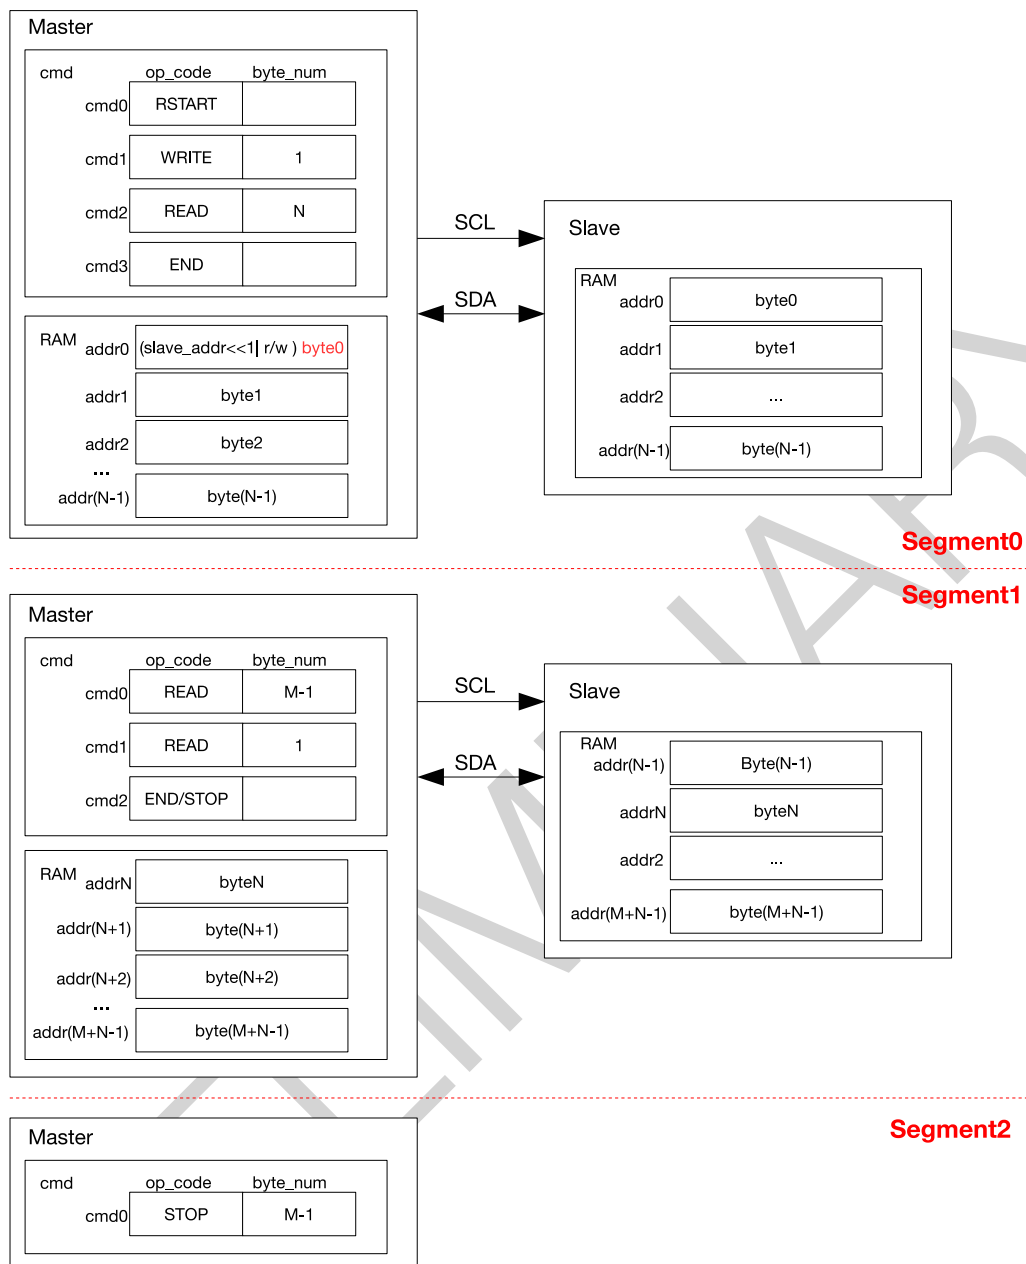

Figure 25-14. I2C_{master} Reading I2C_{slave} with a 7-bit Address in Segments

Figure 25-14 shows how I2C_{master} reads (N+M) bytes of data from an I2C slave in two/three segments separated by END commands. Configuration procedures are described as follows:

1. The procedures for Segment0 is similar to 25-11, except that the last command is an END.
2. Prepare data in the TX RAM of I2C_{slave}, and set I2C_TRANS_START to start data transfer. After executing the END command, I2C_{master} refreshes command registers and the RAM as shown in Segment1, and clears the corresponding I2C_END_DETECT_INT interrupt. If cmd2 in Segment1 is a STOP, then data is read from I2C_{slave} in two segments. I2C_{master} resumes data transfer by setting I2C_TRANS_START and terminates the transfer by sending a STOP bit.
3. If cmd2 in Segment1 is an END, then data is read from I2C_{slave} in three segments. After the second data

transfer finishes and an I2C_END_DETECT_INT interrupt is detected, the cmd box is configured as shown in Segment2. Once I2C_TRANS_START is set, I2C_{master} terminates the transfer by sending a STOP bit.

25.5.8.2 Configuration Example

1. Set I2C_MS_MODE (master) to 1, and I2C_MS_MODE (slave) to 0.
2. We recommend setting I2C_SLAVE_SCL_STRETCH_EN (slave) to 1, so that SCL can be held low for more processing time when I2C_{slave} needs to send data. If this bit is not set, software should write data to be sent to I2C_{slave}'s TX RAM before I2C_{master} initiates transfer. Configuration below is applicable to scenario where I2C_SLAVE_SCL_STRETCH_EN (slave) is 1.
3. Write 1 to I2C_CONF_UPGATE (master) and I2C_CONF_UPGATE (slave) to synchronize registers.
4. Configure command registers of I2C_{master}.

Command registers of I2C _{master}	op_code	ack_value	ack_exp	ack_check_en	byte_num
I2C_COMMAND0 (master)	RSTART	—	—	—	—
I2C_COMMAND1 (master)	WRITE	0	0	1	1
I2C_COMMAND2 (master)	READ	0	0	1	N
I2C_COMMAND3 (master)	END	—	—	—	—

5. Write the address of I2C_{slave} to TX RAM of I2C_{master} in FIFO or non-FIFO mode.
6. Write the address of I2C_{slave} to I2C_SLAVE_ADDR (slave) in I2C_SLAVE_ADDR_REG (slave) register.
7. Write 1 to I2C_CONF_UPGATE (master) and I2C_CONF_UPGATE (slave) to synchronize registers.
8. Write 1 to I2C_TRANS_START (master) to start I2C_{master}'s transfer.
9. Start I2C_{slave}'s transfer according to Section 25.4.14.
10. I2C_{slave} compares the slave address sent by I2C_{master} with its own address in I2C_SLAVE_ADDR (slave). When ack_check_en (master) in I2C_{master}'s WRITE command is 1, I2C_{master} checks ACK value each time it sends a byte. When ack_check_en (master) is 0, I2C_{master} does not check ACK value and take I2C_{slave} as matching slave by default.
 - Match: If the received ACK value matches ack_exp (master) (the expected ACK value), I2C_{master} continues data transfer.
 - Not match: If the received ACK value does not match ack_exp, I2C_{master} generates an I2C_NACK_INT (master) interrupt and stops data transfer.
11. After I2C_SLAVE_STRETCH_INT (slave) is generated, the I2C_STRETCH_CAUSE bit is 0. The address of I2C_{slave} matches the address sent over SDA, and I2C_{slave} needs to send data.
12. Write data to be sent to TX RAM of I2C_{slave} in either FIFO mode or non-FIFO mode according to Section 25.4.10.
13. Set I2C_SLAVE_SCL_STRETCH_CLR (slave) to 1 to release SCL.
14. I2C_{slave} sends data, and I2C_{master} checks ACK value or not according to ack_check_en (master) in the READ command.

15. If data to be read by I2C_{master} in one READ command (N or M) is larger than 32 bytes, an [I2C_SLAVE_STRETCH_INT](#) (slave) interrupt will be generated when TX RAM of I2C_{slave} becomes empty. In this way, I2C_{slave} can hold SCL low, so that software has more time to pad data in TX RAM of I2C_{slave} and read data in RX RAM of I2C_{master}. After software has finished reading, you can set [I2C_SLAVE_STRETCH_INT_CLR](#) (slave) to 1 to clear interrupt, and set [I2C_SLAVE_SCL_STRETCH_CLR](#) (slave) to release the SCL line.
16. Once finishing reading data in the first READ command, I2C_{master} executes the END command and triggers an [I2C_END_DETECT_INT](#) (master) interrupt, which is cleared by setting [I2C_END_DETECT_INT_CLR](#) (master) to 1.
17. Update I2C_{master}'s command registers using one of the following two methods:

Command registers of I2C _{master}	op_code	ack_value	ack_exp	ack_check_en	byte_num
I2C_COMMAND0 (master)	READ	ack_value	ack_exp	1	M
I2C_COMMAND1 (master)	END	—	—	—	—

Or

Command registers of I2C _{master}	op_code	ack_value	ack_exp	ack_check_en	byte_num
I2C_COMMAND0 (master)	READ	0	0	1	M-1
I2C_COMMAND0 (master)	READ	1	0	1	1
I2C_COMMAND1 (master)	STOP	—	—	—	—

18. Write M bytes of data to be sent to TX RAM of I2C_{slave}. If M is larger than 32, then repeat step 14 in FIFO or non-FIFO mode.
19. Write 1 to [I2C_TRANS_START](#) (master) bit to start transfer and repeat step 14.
20. If the last command is a STOP, then set ack_value (master) to 1 after I2C_{master} has received the last byte of data. I2C_{slave} stops transfer upon the [I2C_NACK_INT](#) interrupt. I2C_{master} executes the STOP command to stop transfer and generates an [I2C_TRANS_COMPLETE_INT](#) (master) interrupt.
21. If the last command is an END, then repeat step 16 and proceed on to the next steps.
22. Update I2C_{master}'s command registers.

Command registers of I2C _{master}	op_code	ack_value	ack_exp	ack_check_en	byte_num
I2C_COMMAND1 (master)	STOP	—	—	—	—

23. Write 1 to [I2C_TRANS_START](#) (master) bit to start transfer.
24. I2C_{master} executes the STOP command to stop transfer, and generates an [I2C_TRANS_COMPLETE_INT](#) (master) interrupt.

25.6 Interrupts

- [I2C_SLAVE_STRETCH_INT](#): Generated when one of the four stretching events occurs in slave mode.

- `I2C_DET_START_INT`: Triggered when the master or the slave detects a START bit.
- `I2C_SCL_MAIN_ST_TO_INT`: Triggered when the main state machine `SCL_MAIN_FSM` remains unchanged for over `I2C_SCL_MAIN_ST_TO_I2C[23:0]` clock cycles.
- `I2C_SCL_ST_TO_INT`: Triggered when the state machine `SCL_FSM` remains unchanged for over `I2C_SCL_ST_TO_I2C[23:0]` clock cycles.
- `I2C_RXFIFO_UDF_INT`: Triggered when the I2C controller reads RX FIFO via the APB bus, but RX FIFO is empty.
- `I2C_TXFIFO_OVF_INT`: Triggered when the I2C controller writes TX FIFO via the APB bus, but TX FIFO is full.
- `I2C_NACK_INT`: Triggered when the ACK value received by the master is not as expected, or when the ACK value received by the slave is 1.
- `I2C_TRANS_START_INT`: Triggered when the I2C controller sends a START bit.
- `I2C_TIME_OUT_INT`: Triggered when SCL stays high or low for more than `I2C_TIME_OUT_VALUE` clock cycles during data transfer.
- `I2C_TRANS_COMPLETE_INT`: Triggered when the I2C controller detects a STOP bit.
- `I2C_MST_TXFIFO_UDF_INT`: Triggered when TX FIFO of the master underflows.
- `I2C_ARBITRATION_LOST_INT`: Triggered when the SDA's output value does not match its input value while the master's SCL is high.
- `I2C_BYTE_TRANS_DONE_INT`: Triggered when the I2C controller sends or receives a byte.
- `I2C_END_DETECT_INT`: Triggered when `op_code` of the master indicates an END command and an END condition is detected.
- `I2C_RXFIFO_OVF_INT`: Triggered when RX FIFO of the I2C controller overflows.
- `I2C_TXFIFO_WM_INT`: I2C TX FIFO watermark interrupt. Triggered when `I2C_FIFO_PRT_EN` is 1 and the pointers of TX FIFO are less than `I2C_TXFIFO_WM_THRHD[4:0]`.
- `I2C_RXFIFO_WM_INT`: I2C RX FIFO watermark interrupt. Triggered when `I2C_FIFO_PRT_EN` is 1 and the pointers of RX FIFO are greater than `I2C_RXFIFO_WM_THRHD[4:0]`.

25.7 Register Summary

The addresses in this section are relative to **I2C Controller** base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
Timing registers			
I2C_SCL_LOW_PERIOD_REG	Configures the low level width of SCL	0x0000	R/W
I2C_SDA_HOLD_REG	Configures the hold time after a negative SCL edge	0x0030	R/W
I2C_SDA_SAMPLE_REG	Configures the sample time after a positive SCL edge	0x0034	R/W
I2C_SCL_HIGH_PERIOD_REG	Configures the high level width of SCL	0x0038	R/W
I2C_SCL_START_HOLD_REG	Configures the delay between the SDA and SCL negative edge for a START condition	0x0040	R/W
I2C_SCL_RSTART_SETUP_REG	Configures the delay between the positive edge of SCL and the negative edge of SDA	0x0044	R/W
I2C_SCL_STOP_HOLD_REG	Configures the delay after the SCL clock edge for a STOP condition	0x0048	R/W
I2C_SCL_STOP_SETUP_REG	Configures the delay between the SDA and SCL positive edge for a STOP condition	0x004C	R/W
I2C_SCL_ST_TIME_OUT_REG	SCL status timeout register	0x0078	R/W
I2C_SCL_MAIN_ST_TIME_OUT_REG	SCL main status timeout register	0x007C	R/W
Configuration registers			
I2C_CTR_REG	Transmission configuration register	0x0004	varies
I2C_TO_REG	Timeout control register	0x000C	R/W
I2C_SLAVE_ADDR_REG	Slave address configuration register	0x0010	R/W
I2C_FIFO_CONF_REG	FIFO configuration register	0x0018	R/W
I2C_FILTER_CFG_REG	SCL and SDA filter configuration register	0x0050	R/W
I2C_CLK_CONF_REG	I2C clock configuration register	0x0054	R/W
I2C_SCL_SP_CONF_REG	Power configuration register	0x0080	varies
I2C_SCL_STRETCH_CONF_REG	Configures SCL clock stretching	0x0084	varies
Status registers			
I2C_SR_REG	Describes I2C work status	0x0008	RO
I2C_FIFO_ST_REG	FIFO status register	0x0014	RO
I2C_DATA_REG	Read/write FIFO register	0x001C	R/W
Interrupt registers			
I2C_INT_RAW_REG	Raw interrupt status	0x0020	R/SS/WTC
I2C_INT_CLR_REG	Interrupt clear bits	0x0024	WT
I2C_INT_ENA_REG	Interrupt enable bits	0x0028	R/W
I2C_INT_STATUS_REG	Status of captured I2C communication events	0x002C	RO
Command registers			
I2C_COMD0_REG	I2C command register 0	0x0058	varies
I2C_COMD1_REG	I2C command register 1	0x005C	varies
I2C_COMD2_REG	I2C command register 2	0x0060	varies

Name	Description	Address	Access
I2C_COMD3_REG	I2C command register 3	0x0064	varies
I2C_COMD4_REG	I2C command register 4	0x0068	varies
I2C_COMD5_REG	I2C command register 5	0x006C	varies
I2C_COMD6_REG	I2C command register 6	0x0070	varies
I2C_COMD7_REG	I2C command register 7	0x0074	varies
Version register			
I2C_DATE_REG	Version control register	0x00F8	R/W

25.8 Registers

The addresses in this section are relative to **I2C Controller** base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 25.1. I2C_SCL_LOW_PERIOD_REG (0x0000)

I2C_SCL_LOW_PERIOD This field is used to configure how long SCL remains low in master mode, in I2C module clock cycles. (R/W)

Register 25.2. I2C_SDA_HOLD_REG (0x0030)

I2C_SDA_HOLD_TIME This field is used to configure the time to hold the data after the falling edge of SCL, in I2C module clock cycles. (R/W)

Register 25.3. I2C_SDA_SAMPLE_REG (0x0034)

I2C_SDA_SAMPLE_TIME This field is used to configure how long SDA is sampled, in I2C module clock cycles. (R/W)

Register 25.4. I2C_SCL_HIGH_PERIOD_REG (0x0038)

(reserved)																<i>I2C_SCL_WAIT_HIGH_PERIOD</i>				<i>I2C_SCL_HIGH_PERIOD</i>					
31															16	15				9	8				0
0																0				0				Reset	

I2C_SCL_HIGH_PERIOD This field is used to configure how long SCL remains high in master mode, in I2C module clock cycles. (R/W)

I2C_SCL_WAIT_HIGH_PERIOD This field is used to configure the SCL_FSM's waiting period for SCL high level in master mode, in I2C module clock cycles. (R/W)

Register 25.5. I2C_SCL_START_HOLD_REG (0x0040)

(reserved)																<i>I2C_SCL_START_HOLD_TIME</i>				
31															9	8				0
0																8				Reset

I2C_SCL_START_HOLD_TIME This field is used to configure the time between the falling edge of SDA and the falling edge of SCL for a START condition, in I2C module clock cycles. (R/W)

Register 25.6. I2C_SCL_RSTART_SETUP_REG (0x0044)

(reserved)																<i>I2C_SCL_RSTART_SETUP_TIME</i>				
31															9	8				0
0																8				Reset

I2C_SCL_RSTART_SETUP_TIME This field is used to configure the time between the rising edge of SCL and the falling edge of SDA for a RSTART condition, in I2C module clock cycles. (R/W)

Register 25.7. I2C_SCL_STOP_HOLD_REG (0x0048)

I2C_SCL_STOP_HOLD_TIME This field is used to configure the delay after the STOP condition, in I2C module clock cycles. (R/W)

Register 25.8. I2C_SCL_STOP_SETUP_REG (0x004C)

I2C_SCL_STOP_SETUP_TIME This field is used to configure the time between the rising edge of SCL and the rising edge of SDA, in I2C module clock cycles. (R/W)

Register 25.9. I2C_SCL_ST_TIME_OUT_REG (0x0078)

I2C_SCL_ST_TO_I2C The maximum time that SCL_FSM remains unchanged. It should be no more than 23. (R/W)

Register 25.10. I2C_SCL_MAIN_ST_TIME_OUT_REG (0x007C)

I2C_SCL_MAIN_ST_TO_I2C The maximum time that SCL_MAIN_FSM remains unchanged. It should be no more than 23. (R/W)

Register 25.12. I2C_TO_REG (0x000C)

I2C_TIME_OUT_VALUE This field is used to configure the timeout for receiving a data bit in APB clock cycles. (R/W)

I2C_TIME_OUT_EN This is the enable bit for timeout control. (R/W)

Register 25.13. I2C_SLAVE_ADDR_REG (0x0010)

I2C_SLAVE_ADDR When the I2C controller is in slave mode, this field is used to configure the slave address. (R/W)

I2C_ADDR_10BIT_EN This field is used to enable the 10-bit addressing mode in master mode. (R/W)

Register 25.16. I2C_CLK_CONF_REG (0x0054)

(reserved)										I2C_SCLK_ACTIVE I2C_SCLK_SEL		I2C_SCLK_DIV_B		I2C_SCLK_DIV_A		I2C_SCLK_DIV_NUM			
31											22	21	20	19	14	13	8	7	0
0	0	0	0	0	0	0	0	0	0	0	1	0	0		0		0		0

Reset

I2C_SCLK_DIV_NUM The integral part of the divisor. (R/W)

I2C_SCLK_DIV_A The numerator of the divisor's fractional part. (R/W)

I2C_SCLK_DIV_B The denominator of the divisor's fractional part. (R/W)

I2C_SCLK_SEL The clock selection bit for the I2C controller. 0: XTAL_CLK; 1: FOSC_CLK. (R/W)

I2C_SCLK_ACTIVE The clock switch bit for the I2C controller. (R/W)

Register 25.17. I2C_SCL_SP_CONF_REG (0x0080)

(reserved)																I2C_SDA_PD_EN I2C_SCL_PD_EN		I2C_SCL_RST_SLV_NUM		I2C_SCL_RST_SLV_EN						
31																					8	7	6	5	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		0	0

Reset

I2C_SCL_RST_SLV_EN When the master is idle, set this bit to send out SCL pulses. The number of pulses equals to I2C_SCL_RST_SLV_NUM[4:0]. (R/W/SC)

I2C_SCL_RST_SLV_NUM Configures the pulses of SCL generated in master mode. Valid when I2C_SCL_RST_SLV_EN is 1. (R/W)

I2C_SCL_PD_EN The power down enable bit for the I2C output SCL line. 0: Not power down; 1: Power down. Set I2C_SCL_FORCE_OUT and I2C_SCL_PD_EN to 1 to stretch SCL low. (R/W)

I2C_SDA_PD_EN The power down enable bit for the I2C output SDA line. 0: Not power down; 1: Power down. Set I2C_SDA_FORCE_OUT and I2C_SDA_PD_EN to 1 to stretch SDA low. (R/W)

Register 25.18. I2C_SCL_STRETCH_CONF_REG (0x0084)

(reserved)														I2C_SLAVE_BYTE_ACK_LVL				I2C_SLAVE_BYTE_ACK_CTL_EN				I2C_SLAVE_SCL_STRETCH_CLR				I2C_SLAVE_SCL_STRETCH_EN				I2C_STRETCH_PROTECT_NUM			
31															14	13	12	11	10	9					0								
0														0				0				0				0	Reset						

I2C_STRETCH_PROTECT_NUM Configures the time period to release the SCL line from stretching to avoid timing violation. Usually it should be larger than the SDA setup time. (R/W)

I2C_SLAVE_SCL_STRETCH_EN The enable bit for SCL clock stretching. 0: Disable; 1: Enable. The SCL output line will be stretched low when I2C_SLAVE_SCL_STRETCH_EN is 1 and one of the four stretching events occurs. The cause of stretching can be seen in I2C_STRETCH_CAUSE. (R/W)

I2C_SLAVE_SCL_STRETCH_CLR Set this bit to clear SCL clock stretching. (WT)

I2C_SLAVE_BYTE_ACK_CTL_EN The enable bit for slave to control the level of the ACK bit. (R/W)

I2C_SLAVE_BYTE_ACK_LVL Set the level of the ACK bit when I2C_SLAVE_BYTE_ACK_CTL_EN is set. (R/W)

Register 25.19. I2C_SR_REG (0x0008)

(reserved)	I2C_SCL_STATE_LAST	(reserved)	I2C_SCL_MAIN_STATE_LAST	I2C_TXFIFO_CNT	(reserved)	I2C_STRETCH_CAUSE	I2C_RXFIFO_CNT	(reserved)	I2C_SLAVE_ADDRESSED	I2C_BUS_BUSY	I2C_ARB_LOST	(reserved)	I2C_SLAVE_RW	I2C_RESP_REC								
31	30	28	27	26	24	23	18	17	16	15	14	13	8	7	6	5	4	3	2	1	0	
0	0	0	0	0	0	0	0	0	0x3	0	0	0	0	0	0	0	0	0	0	0	0	Reset

I2C_RESP_REC The received ACK value in master mode or slave mode. 0: ACK; 1: NACK. (RO)

I2C_SLAVE_RW When in slave mode, 0: master writes to slave; 1: master reads from slave. (RO)

I2C_ARB_LOST When the I2C controller loses control of the SCL line, this bit changes to 1. (RO)

I2C_BUS_BUSY 0: the I2C bus is in idle state; 1: the I2C bus is busy transferring data. (RO)

I2C_SLAVE_ADDRESSED When the I2C controller is in slave mode, and the address sent by the master matches the address of the slave, this bit is at high level. (RO)

I2C_RXFIFO_CNT This field represents the number of data bytes to be sent. (RO)

I2C_STRETCH_CAUSE The cause of SCL clock stretching in slave mode. 0: stretching SCL low when the master starts to read data; 1: stretching SCL low when TX FIFO is empty in slave mode; 2: stretching SCL low when RX FIFO is full in slave mode. (RO)

I2C_TXFIFO_CNT This field stores the number of data bytes received in RAM. (RO)

I2C_SCL_MAIN_STATE_LAST This field indicates the status of the state machine. 0: idle; 1: address shift; 2: ACK address; 3: receive data; 4: transmit data; 5: send ACK; 6: wait for ACK. (RO)

I2C_SCL_STATE_LAST This field indicates the status of the state machine used to produce SCL. 0: idle; 1: start; 2: falling edge; 3: low; 4: rising edge; 5: high; 6: stop. (RO)

Register 25.22. I2C_INT_RAW_REG (0x0020)

Continued from the previous page...

I2C_SCL_ST_TO_INT_RAW The raw interrupt bit for the I2C_SCL_ST_TO_INT interrupt.
(R/SS/WTC)

I2C_SCL_MAIN_ST_TO_INT_RAW The raw interrupt bit for the I2C_SCL_MAIN_ST_TO_INT interrupt.
(R/SS/WTC)

I2C_DET_START_INT_RAW The raw interrupt bit for the I2C_DET_START_INT interrupt.
(R/SS/WTC)

I2C_SLAVE_STRETCH_INT_RAW The raw interrupt bit for the I2C_SLAVE_STRETCH_INT interrupt.
(R/SS/WTC)

I2C_GENERAL_CALL_INT_RAW The raw interrupt bit for the I2C_GENERAL_CALL_INT interrupt.
(R/SS/WTC)

Register 25.27. I2C_COMD1_REG (0x005C)

I2C_COMMAND1_DONE														(reserved)														I2C_COMMAND1													
31	30													14	13													0	Reset												
0	0													0	0													0													

I2C_COMMAND1 This is the content of command register 1. It is the same as that of [I2C_COMMAND0](#). (R/W)

I2C_COMMAND1_DONE When command 1 has been executed in master mode, this bit changes to high level. (R/W/SS)

Register 25.28. I2C_COMD2_REG (0x0060)

I2C_COMMAND2_DONE														(reserved)														I2C_COMMAND2													
31	30													14	13													0	Reset												
0	0													0	0													0													

I2C_COMMAND2 This is the content of command register 2. It is the same as that of [I2C_COMMAND0](#). (R/W)

I2C_COMMAND2_DONE When command 2 has been executed in master mode, this bit changes to high Level. (R/W/SS)

Register 25.29. I2C_COMD3_REG (0x0064)

I2C_COMMAND3_DONE														(reserved)														I2C_COMMAND3													
31	30													14	13													0	Reset												
0	0													0	0													0													

I2C_COMMAND3 This is the content of command register 3. It is the same as that of [I2C_COMMAND0](#). (R/W)

I2C_COMMAND3_DONE When command 3 has been executed in master mode, this bit changes to high level. (R/W/SS)

Register 25.30. I2C_COMD4_REG (0x0068)

<i>I2C_COMMAND4_DONE</i>														<i>(reserved)</i>														<i>I2C_COMMAND4</i>													
31	30													14	13													0	Reset												
0														0														0													

I2C_COMMAND4 This is the content of command register 4. It is the same as that of [I2C_COMMAND0](#). (R/W)

I2C_COMMAND4_DONE When command 4 has been executed in master mode, this bit changes to high level. (R/W/SS)

Register 25.31. I2C_COMD5_REG (0x006C)

<i>I2C_COMMAND5_DONE</i>														<i>(reserved)</i>														<i>I2C_COMMAND5</i>													
31	30													14	13													0	Reset												
0														0														0													

I2C_COMMAND5 This is the content of command register 5. It is the same as that of [I2C_COMMAND0](#). (R/W)

I2C_COMMAND5_DONE When command 5 has been executed in master mode, this bit changes to high level. (R/W/SS)

Register 25.32. I2C_COMD6_REG (0x0070)

<i>I2C_COMMAND6_DONE</i>														<i>(reserved)</i>														<i>I2C_COMMAND6</i>													
31	30													14	13													0	Reset												
0														0														0													

I2C_COMMAND6 This is the content of command register 6. It is the same as that of [I2C_COMMAND0](#). (R/W)

I2C_COMMAND6_DONE When command 6 has been executed in master mode, this bit changes to high level. (R/W/SS)

Register 25.33. I2C_COMD7_REG (0x0074)

I2C_COMMAND7 This is the content of command register 7. It is the same as that of [I2C_COMMAND0](#). (R/W)

I2C_COMMAND7_DONE When command 7 has been executed in master mode, this bit changes to high level. (R/W/SS)

Register 25.34. I2C_DATE_REG (0x00F8)

I2C_DATE This is the version control register. (R/W)

26 LCD and Camera Controller (LCD_CAM)

26.1 Overview

This LCD and Camera (LCD_CAM) controller consists of a LCD module and a camera module. The LCD module is designed to send parallel video data signals, and its bus supports RGB, MOTO6800, and I8080 interface timing. The camera module is designed to receive parallel video data signals, and its bus supports DVP 8-/16-bit modes.

26.2 Features

- Supports the following operation modes:
 - LCD master TX mode
 - Camera slave RX mode
 - Camera master RX mode
- Supports simultaneous connection to an external LCD and an external camera
- When connected with an external LCD, the following is supported:
 - 8-/16-bit parallel output mode
 - RGB, MOTO6800, and I8080 LCD formats
 - LCD data retrieved from internal memory via GDMA
- When connected with an external camera (i.e. DVP image sensor), the following is supported:
 - 8-/16-bit parallel input mode
 - Camera data stored into internal memory via GDMA
- Supports LCD_CAM interface interrupts

26.3 Functional Description

26.3.1 Block Diagram

Figure 26-1 shows the structure of this LCD_CAM module, including

- 1 x TX control unit (LCD_Ctrl)
- 1 x RX control unit (Camera_Ctrl)
- 1 x asynchronous TX FIFO (Async Tx FIFO) for communicating with external devices
- 1 x asynchronous RX FIFO (Async Rx FIFO) for communicating with external devices
- 2 x clock generators (LCD_Clock Generator and CAM_Clock Generator) for generating the module clocks
- 2 x format converters (RGB/YCbCr Converter) for converting video data into various formats

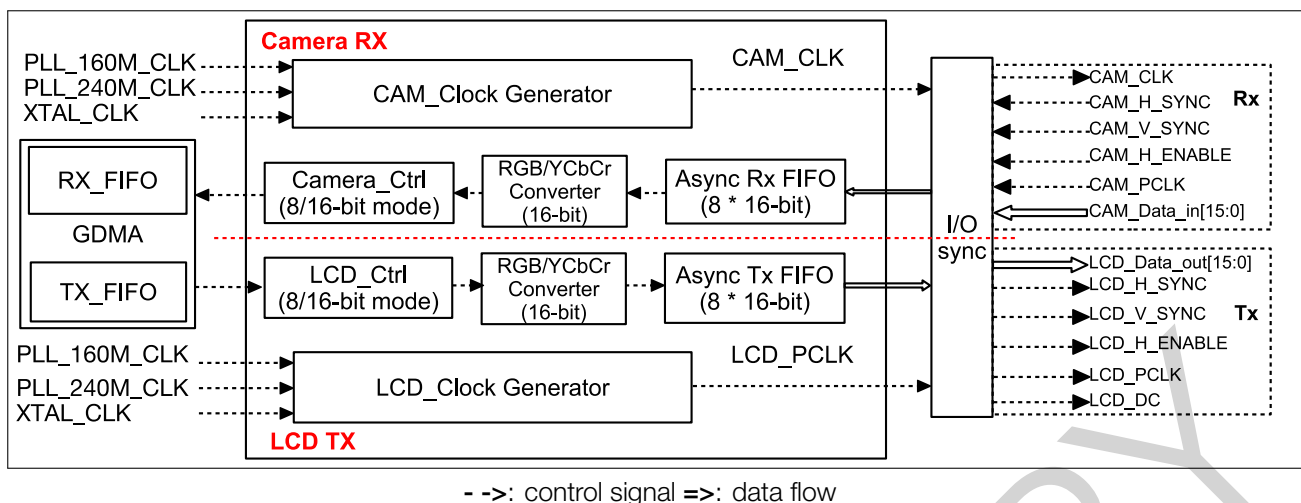

Figure 26-1. LCD_CAM Block Diagram

26.3.2 Signal Description

Table 26-1. Signal Description

Operation Mode	Signal ¹	Direction	Function
Camera Slave RX Mode	CAM_PCLK	Input	Camera pixel clock signal
	CAM_V_SYNC	Input	Vertical synchronization signal (VSYNC) ³
	CAM_H_SYNC	Input	Horizontal synchronization signal (HSYNC) ³
	CAM_H_ENABLE	Input	Horizontal enable signal (DE) ³
	CAM_Data_in[N:0] ²	Input	Camera parallel input data bus, 8-/16-bit supported
Camera Master RX Mode	CAM_PCLK	Input	Camera pixel clock input signal
	CAM_CLK	Output	Camera master clock output signal
	CAM_V_SYNC	Input	Vertical synchronization signal ³
	CAM_H_SYNC	Input	Horizontal synchronization signal ³
	CAM_H_ENABLE	Input	Horizontal enable signal ³
	CAM_Data_in[N:0] ²	Input	Camera parallel input data bus, 8-/16-bit supported
LCD Master TX Mode	LCD_PCLK	Output	LCD pixel clock signal
	LCD_H_SYNC	Output	Horizontal synchronization signal in RGB format
	LCD_V_SYNC	Output	Vertical synchronization signal in RGB mode
	LCD_H_ENABLE	Output	Horizontal enable signal in RGB format
	LCD_CD	Output	Command and data (CD) signal in I8080 format
	LCD_CS	Output	Chip select (CS) signal in I8080/MOTO6800 format
	LCD_Data_out[N:0] ²	Output	LCD parallel output data bus, 8-/16-bit supported

¹ All signals of LCD_CAM must be mapped to the chip's pin via GPIO matrix. For more information, see Chapter 5 [IO MUX and GPIO Matrix \(GPIO, IO MUX\)](#).

² For the input/output signals with 8 or 16 bit width, $N = 7$ or 15 respectively.

³ If `LCD_CAM_CAM_VH_DE_MODE_EN` is set, i.e., VSYNC + HSYNC mode is selected, in this mode, the signals of VSYNC, HSYNC and DE are used to control the data. For this case, users need to wire the three signal lines. If `LCD_CAM_CAM_VH_DE_MODE_EN` is cleared, i.e. DE mode is selected, the signals of VSYNC and DE are used to control the data. For this case, wiring HSYNC signal line is not a must. But in this case, the YUV-RGB conversion function of camera module is not available.

26.3.3 LCD_CAM Module Clocks

26.3.3.1 LCD Clock

The clocks used in LCD module are generated by LCD_Clock Generator from clock sources, see Figure 26-2.

The clocks include:

- master clock: LCD_CLK, divided from clock sources
- pixel clock: LCD_PCLK, divided from LCD_CLK

The clock source can be one of the following, depending on the configuration of `LCD_CAM_LCD_CLK_SEL` in register `LCD_CAM_LCD_CLOCK_REG`:

- 0: disable LCD clock source
- 1: XTAL_CLK
- 2: PLL_240M_CLK
- 3: PLL_160M_CLK

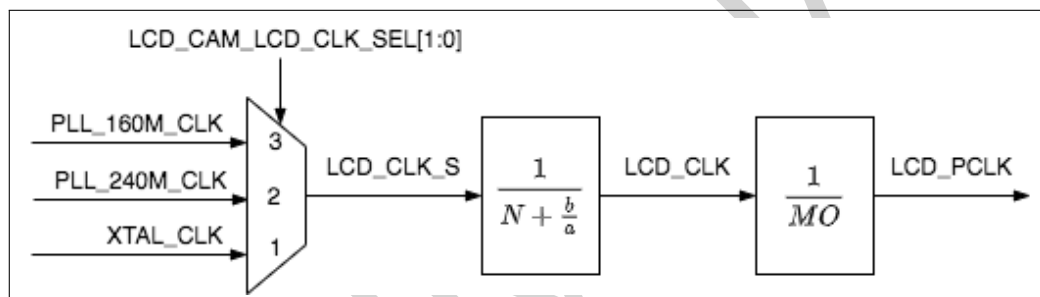

Figure 26-2. LCD Clock

The following formula shows the relation between the frequency of LCD_CLK ($f_{\text{LCD_CLK}}$) and the divider clock source frequency ($f_{\text{LCD_CLK_S}}$):

$$f_{\text{LCD_CLK}} = \frac{f_{\text{LCD_CLK_S}}}{N + \frac{b}{a}}$$

N is an integer value between 2 and 256. The value of N corresponds to the value of `LCD_CAM_LCD_CLKM_DIV_NUM` in register `LCD_CAM_LCD_CLOCK_REG` as follows:

- When `LCD_CAM_LCD_CLKM_DIV_NUM` = 0, N = 256.
- When `LCD_CAM_LCD_CLKM_DIV_NUM` = 1, N = 2.
- When `LCD_CAM_LCD_CLKM_DIV_NUM` has any other value, N = `LCD_CAM_LCD_CLKM_DIV_NUM`.

“b” corresponds to the value of `LCD_CAM_LCD_CLKM_DIV_B`, and “a” to the value of `LCD_CAM_LCD_CLKM_DIV_A`. For integer divider, `LCD_CAM_LCD_CLKM_DIV_A` and `LCD_CAM_LCD_CLKM_DIV_B` are cleared. For fractional divider, the value of `LCD_CAM_LCD_CLKM_DIV_B` should be less than the value of `LCD_CAM_LCD_CLKM_DIV_A`.

The following formula shows the relation between the frequencies of LCD_PCLK ($f_{\text{LCD_PCLK}}$) and LCD_CLK ($f_{\text{LCD_CLK}}$):

$$f_{\text{LCD_PCLK}} = \frac{f_{\text{LCD_CLK}}}{\text{MO}}$$

MO is determined by `LCD_CAM_LCD_CLK_EQU_SYSCLK` and `LCD_CAM_LCD_CLKCNT_N`.

- When `LCD_CAM_LCD_CLK_EQU_SYSCLK = 1`, $\text{MO} = 1$.
- When `LCD_CAM_LCD_CLK_EQU_SYSCLK = 0`, $\text{MO} = \text{LCD_CAM_LCD_CLKCNT_N} + 1$.

Notes:

- `LCD_CAM_LCD_CLKCNT_N` must not be configured as 0.
- Using fractional divider may bring clock jitter. In case that `LCD_CLK` and `LCD_PCLK` can not be generated from `PLL_160M_CLK` by integer divider, `PLL_240M_CLK` can be used as clock source. For more information, please refer to Chapter 6 *Reset and Clock*.

26.3.3.2 Camera Clock

The clocks used in camera module are generated by CAM_Clock Generator from clock sources, see Figure 26-3.

The clocks include:

- master clock: `CAM_CLK`, master clock output from camera module, divided from clock sources.
- pixel clock: `CAM_CLK`, clock input from camera slave.

`LCD_CAM_CAM_CLK_SEL` in register `LCD_CAM_CAM_CTRL_REG` is used to select one of the following clock sources for camera module:

- 0: disable camera clock source
- 1: `XTAL_CLK`
- 2: `PLL_240M_CLK`
- 3: `PLL_160M_CLK`

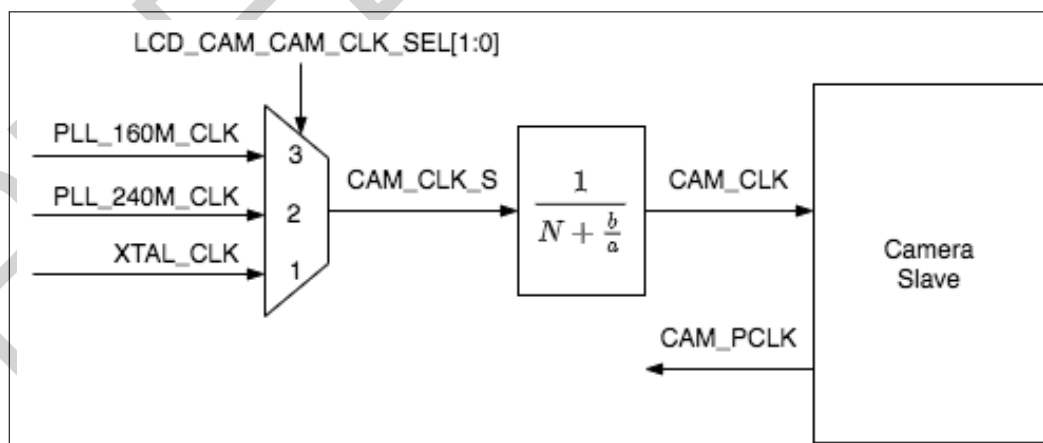

Figure 26-3. Camera Clock

The following formula shows the relation between the frequencies of `CAM_CLK` ($f_{\text{CAM_CLK}}$) and the divider clock

source ($f_{CAM_CLK_S}$):

$$f_{CAM_CLK} = \frac{f_{CAM_CLK_S}}{N + \frac{b}{a}}$$

N is an integer value between 2 and 256. The value of N corresponds to the value of `LCD_CAM_CAM_CLKM_DIV_NUM` in register `LCD_CAM_CAM_CTRL_REG` as follows:

- When `LCD_CAM_CAM_CLKM_DIV_NUM` = 0, N = 256.
- When `LCD_CAM_CAM_CLKM_DIV_NUM` = 1, N = 2.
- When `LCD_CAM_CAM_CLKM_DIV_NUM` has any other value, N = `LCD_CAM_CAM_CLKM_DIV_NUM`.

“b” corresponds to the value of `LCD_CAM_CAM_CLKM_DIV_B`, and “a” to the value of `LCD_CAM_CAM_CLKM_DIV_A`. For integer divider, `LCD_CAM_CAM_CLKM_DIV_A` and `LCD_CAM_CAM_CLKM_DIV_B` are cleared. For fractional divider, the value of `LCD_CAM_CAM_CLKM_DIV_B` should be less than the value of `LCD_CAM_CAM_CLKM_DIV_A`.

26.3.4 LCD_CAM Reset

The units in LCD_CAM module can be reset by the following bits:

- `LCD_CAM_LCD_RESET`: set this bit to reset LCD control unit (LCD_Ctrl) and LCD video data format converter (RGB/YCbCr Converter).
- `LCD_CAM_CAM_RESET`: set this bit to reset camera control unit (Camera_Ctrl) and camera video data format converter (RGB/YCbCr Converter).
- `LCD_CAM_LCD_AFIFO_RESET`: set this bit to reset Async Tx FIFO.
- `LCD_CAM_CAM_AFIFO_RESET`: set this bit to reset Async Rx FIFO.

Notes:

- The above-mentioned reset bits are hardware self-clearing, i.e., the hardware automatically clears these bits once 1 is written.
- LCD/camera module clock must be configured first before the module and FIFO are reset.

26.3.5 LCD_CAM Data Format Control

26.3.5.1 LCD Data Format Control

When the LCD module is used to send data, the bit/byte order of the data from DMA can be adjusted by configuring

- `LCD_CAM_LCD_2BYTE_EN`
 - 1: LCD output data is in 16-bit mode.
 - 0: LCD output data is in 8-bit mode.
- `LCD_CAM_LCD_BIT_ORDER`
 - 1: Change data bit order.
 - * Change `LCD_DATA_out[7:0]` to `LCD_DATA_out[0:7]` in 8-bit mode.
 - * Change `LCD_DATA_out[15:0]` to `LCD_DATA_out[0:15]` in 16-bit mode.

- 0: Do not change the bit order.
- [LCD_CAM_LCD_BYTE_ORDER](#)
 - 1: Invert data byte order, only valid in 16-bit mode.
 - 0: Do not invert.
- [LCD_CAM_LCD_8BITS_ORDER](#)
 - 1: Swap every two data bytes, valid in 8-bit mode
 - 0: Do not swap.

For the detailed configuration, see Table 26-2.

Table 26-2. LCD Data Format Control

Data from DMA ¹	LCD_CAM_LCD_2BYTE_EN	LCD_CAM_LCD_BIT_ORDER	LCD_CAM_LCD_BYTE_ORDER ²	LCD_CAM_LCD_8BITS_ORDER ²	TX Data ^{3,4}
B0,B1,B2,B3	0	0	0	0	{B0}{B1}{B2}{B3}
			0	1	{B1}{B0}{B3}{B2}
		1	0	0	{B0'}{B1'}{B2'}{B3'}
			0	1	{B1'}{B0'}{B3'}{B2'}
	1	0	0	0	{B1,B0}{B3,B2}
			1	0	{B0,B1}{B2,B3}
		1	0	0	{B1',B0'}{B3',B2'}
			1	0	{B0',B1'}{B2',B3'}

¹ B0 ~ B3 represent the bytes of the data from DMA, from low address to high address.

² Only the configuration listed in the table is valid. Other configuration may cause unexpected data errors.

³ In TX data, the bits in {} are in big-endian, and are in parallel with each other, while the data of {} is in serial with the data of other {}. Data is sent out from left to right. Take {B0}{B1}{B2}{B3} as an example. The bits in {B0} are in parallel with each other, but are in serial with the bits in {B1}{B2}{B3}. {B0} is sent out first.

⁴ In TX data, $Bn'[7:0] = Bn[0:7]$ ($n = 0, 1, 2, 3$).

Note:

If only one byte of data is sent out each time, LCD_Data_out[7:0] is valid, while LCD_Data_out[15:8] is invalid.

26.3.5.2 Camera Data Format Control

When the camera module is used to receive data, the bit/byte order of the data to DMA can be adjusted by configuring

- [LCD_CAM_CAM_2BYTE_EN](#)
 - 1: Camera input data is in 16-bit mode.
 - 0: Camera input data is in 8-bit mode.
- [LCD_CAM_CAM_BIT_ORDER](#)
 - 1: Change data bit order.

- * Change CAM_DATA_in[7:0] to CAM_DATA_in[0:7] in 8-bit mode.
- * Change CAM_DATA_in[15:0] to CAM_DATA_in[0:15] in 16-bit mode.

– 0: Do not change the bit order.

- **LCD_CAM_CAM_BYTE_ORDER**

– 1: Invert data byte order, only valid in 16-bit mode.

– 0: Do not invert.

For the detailed configuration, see Table 26-3.

Table 26-3. CAM Data Format Control

RX Data ¹	LCD_CAM_CAM _2BYTE_EN	LCD_CAM_CAM _BIT_ORDER ²	LCD_CAM_CAM _BYTE_ORDER ²	Data to DMA ^{3,4}	
{B0}{B1}{B2}{B3}	0	0	0	B0,B1,B2,B3	
		1	0	B0',B1',B2',B3'	
{B1,B0}{B3,B2}	1	0	0	B0,B1,B2,B3	
			1	B1,B0,B3,B2	
		1	0	0	B0',B1',B2',B3'
			1	1	B1',B0',B3',B2'

¹ In RX data, the bits in {} are in big-endian, and are in parallel with each other, while the data of {} is in serial with the data of other {}. Data is received from left to right. Take {B0}{B1}{B2}{B3} as an example. The bits in {B0} are in parallel with each other, but are in serial with the bits in {B1}{B2}{B3}. {B1} is received first.

² Only the configuration listed in the table is valid. Other configuration may cause unexpected data errors.

³ B0 ~ B3 represent the bytes of the data to DMA, from low address to high address.

⁴ In the data to DMA, Bn'[7:0] = Bn[0:7] (n = 0,1,2,3).

Note:

If only one byte is received each time, CAM_Data_in[7:0] is valid data. For such case, users must connect CAM_Data_in[7:0] with the master.

26.3.6 YUV-RGB Data Format Conversion

The LCD_CAM module supports data format conversion among YUV and RGB. LCD module and camera module each has a data format converter. The converter supports format conversion over:

- BT601 and BT709 standards
- RGB565 (full/limited range) and YUV422/420/411 (full/limited range) formats
- YUV422/420/411 (full/limited range) formats

26.3.6.1 YUV Timing

In LCD_CAM module, assume that there are 8 pixels to be transmitted, corresponding to YUV data $[Y_i, U_i, V_i]$ ($i = 1 \sim 8$). Then:

- in YUV422 mode, the LCD sends (or the camera receives) the data as follows:

Y_1	U_1	Y_2	V_2	Y_3	U_3	Y_4	V_4	Y_5	U_5	Y_6	V_6	Y_7	U_7	Y_8	V_8
-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------

- in YUV420 mode, the LCD sends (or the camera receives) the data as follows:

Y_1	U_1	Y_2	Y_3	U_3	Y_4	Y_5	V_5	Y_6	Y_7	V_7	Y_8
-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------

- in YUV411 mode, the LCD sends (or the camera receives) the data as follows:

Y_1	U_1	Y_2	Y_3	V_3	Y_4	Y_5	U_5	Y_6	Y_7	V_7	Y_8
-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------

26.3.6.2 Data Conversion Configuration

The configuration for format converter in camera module is identical to that in LCD module. Therefore, the configuration process is illustrated below using the format conversion in LCD module as an example:

- Enable YUV-RGB format converter by setting [LCD_CAM_LCD_CONV_BYPASS](#).
- Configure the data transfer mode by configuring [LCD_CAM_LCD_CONV_MODE_8BITS_ON](#):
 - 0: use 16-bit data transfer mode
 - 1: use 8-bit data transfer mode
- Select the standard by configuring [LCD_CAM_LCD_CONV_PROTOCOL_MODE](#):
 - 0: use BT601 standard
 - 1: use BT709 standard
- Configure the conversion mode:

Table 26-4. Conversion Mode Control

Conversion Mode	TRANS_MODE ¹	YUV_MODE ²	YUV2YUV_MODE ³
RGB565 -> YUV422	1	0	3
RGB565 -> YUV420	1	1	3
RGB565 -> YUV411	1	2	3
YUV422 -> RGB565	0	0	3
YUV420 -> RGB565	0	1	3
YUV411 -> RGB565	0	2	3
YUV422 -> YUV420	1	0	1
YUV422 -> YUV411	1	0	2
YUV420 -> YUV422	1	1	0
YUV420 -> YUV411	1	1	2
YUV411 -> YUV422	1	2	0
YUV411 -> YUV420	1	2	1

¹ The value of `LCD_CAM_LCD_CONV_TRANS_MODE`

² The value of `LCD_CAM_LCD_CONV_YUV_MODE`

³ The value of `LCD_CAM_LCD_CONV_YUV2YUV_MODE`

- Configure the color range for input data by configuring `LCD_CAM_LCD_CONV_DATA_IN_MODE`:
 - 1: full color range¹
 - 0: limited color range²
- Configure the color range for output data by configuring `LCD_CAM_LCD_CONV_DATA_OUT_MODE`:
 - 0: limited color range
 - 1: full color range

Note:

1. If full color range is selected, the color range of RGB or YUV is 0 ~ 255.
2. If limited color range is selected,
 - the color range of RGB is: 16 ~ 240.
 - the color range of YUV is:
 - Y: 16 ~ 240.
 - U-V: 16 ~ 235.

26.4 Software Configuration Process

Note:

Updating the register configuration described in LCD module or camera module requires to set `LCD_CAM_LCD_UPDATE` and `LCD_CAM_CAM_UPDATE`, respectively, to synchronize registers from APB clock domain to LCD/camera clock domain. For more detailed configuration, see the configuration examples below.

26.4.1 Configure LCD (RGB Format) as TX Mode

Follow the steps below to configure LCD (RGB format) as TX mode via software:

1. Configure clock according to Section 26.3.3.
2. Configure signal pins according to Table 26-1.
3. Enable corresponding interrupts, see Section 26.5.
4. Enable RGB format by setting `LCD_CAM_LCD_RGB_MODE_EN`.
5. Configure frame format by the following registers. See the figures below.
 - `LCD_CAM_LCD_VT_HEIGHT`
 - `LCD_CAM_LCD_VA_HEIGHT`
 - `LCD_CAM_LCD_HB_FRONT`
 - `LCD_CAM_LCD_HT_WIDTH`
 - `LCD_CAM_LCD_HA_WIDTH`
 - `LCD_CAM_VB_FRONT`
 - `LCD_CAM_LCD_VSYNC_WIDTH`

Figure 26-4. LCD Frame Structure

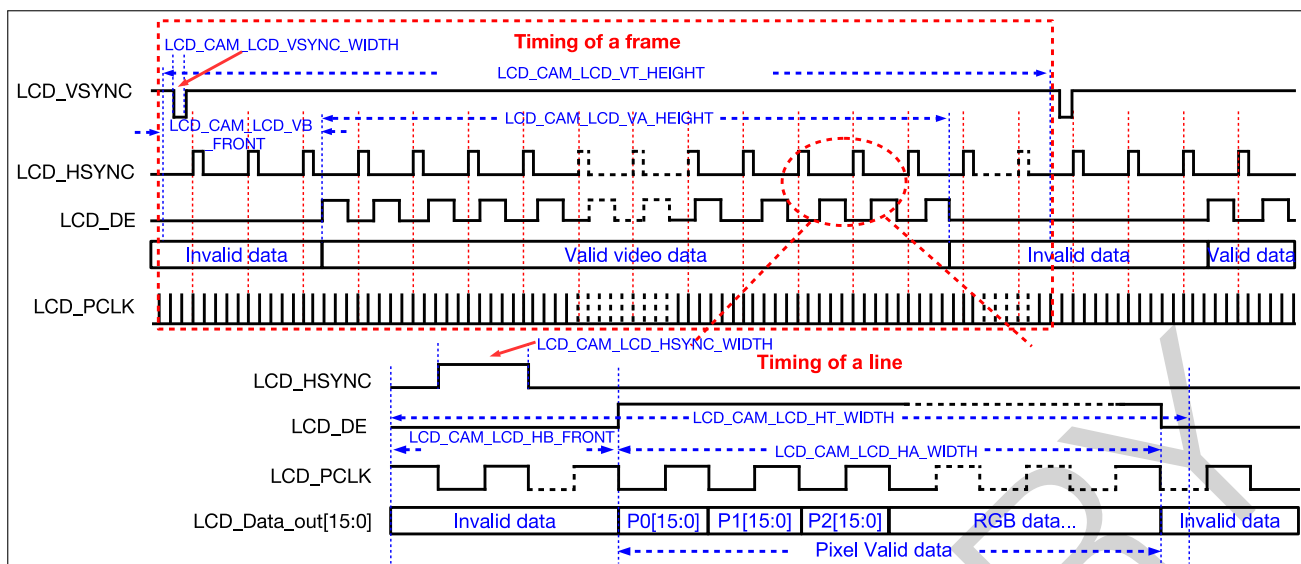

Figure 26-5. LCD Timing (RGB Format)

Note:

When configuring the parameters shown in the figures above, please note that the parameter is equal to the register value + 1. For example, if the expected VSYNC width is 1, then please configure `LCD_CAM_LCD_VSYNC_WIDTH` to 0. For more information, see the register description.

6. Set `LCD_CAM_LCD_UPDATE`.
7. Reset TX control unit (`LCD_Ctrl`) and Async Tx FIFO as described in Section 26.3.4.
8. Configure GDMA outlink.
9. Start transmitting data:
 - wait till LCD slave gets ready.
 - then set `LCD_CAM_LCD_START` to start transmitting data.
10. Wait for the interrupt signals set in Step 3.
11. In frame intervals during data transmitting, check if the bit `LCD_CAM_LCD_NEXT_FRAME_EN` is set:
 - If yes, set `LCD_CAM_LCD_UPDATE` (repeating the steps above) to continue transmitting next frame.
 - If not, LCD stops transmitting data.
12. Clear `LCD_CAM_LCD_START` if data transmission is done.

26.4.2 Configure LCD (I8080/MOTO6800 Format) as TX Mode

Figure 26-6 shows the LCD timing sequence in I8080 format.

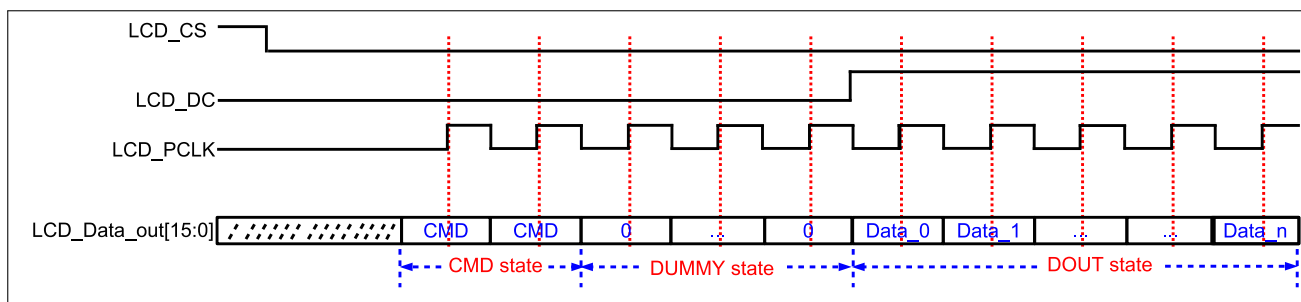

Figure 26-6. LCD Timing (I8080 Format)

Follow the steps below to configure LCD (I8080 format) as TX mode via software:

1. Configure clock according to Section 26.3.3.
2. Configure signal pins according to Table 26-1.
3. Enable corresponding interrupts, see Section 26.5.
4. Clear `LCD_CAM_LCD_RGB_MODE_EN`.
5. Configure CMD phase by `LCD_CAM_LCD_CMD`, `LCD_CAM_LCD_CMD_2_CYCLE_EN`, and `LCD_CAM_LCD_CMD_VALUE`.
6. Configure DUMMY phase by `LCD_CAM_LCD_DUMMY` and `LCD_CAM_LCD_DUMMY_CYCLELEN`.
7. Configure DOUT phase by `LCD_CAM_LCD_DOUT`, depending on the output mode:
 - In a fixed-length output^a, configure data length in `LCD_CAM_LCD_DOUT_CYCLELEN`.
 - In a continuous output^b, set `LCD_CAM_LCD_ALWAYS_OUT_EN`. Users do not need to configure `LCD_CAM_LCD_DOUT_CYCLELEN`.

Note:

- (a) In a fixed-length output, the LCD module stops sending data once the data length reaches the value set in `LCD_CAM_LCD_DOUT_CYCLELEN`.
- (b) In a continuous output, LCD module keeps sending data till:
 - i. `LCD_CAM_LCD_START` is cleared;
 - ii. or `LCD_CAM_LCD_RESET` is set;
 - iii. or all the data in GDMA is sent out.

8. Configure the CD signal mode, including the default value of the CD signal and the values at each phase, see the description of `LCD_CAM_LCD_MISC_REG`.
9. Set `LCD_CAM_LCD_UPDATE`.
10. Reset TX control unit (`LCD_Ctrl`) and Async Tx FIFO as described in Section 26.3.4.
11. Configure GDMA outlink.
12. Start transmitting data:
 - wait till LCD slave gets ready.

- then set `LCD_CAM_LCD_START` to start transmitting data.

13. Wait for the interrupt signals set in Step 3.

14. Clear `LCD_CAM_LCD_START` if data transmission is done.

Notes:

No matter in which format, RGB or I8080/MOTO6800, the rules below must be followed when accessing internal memory via GDMA:

- If LCD data bus is configured to 8-bit parallel output mode, then
 - pixel clock frequency must be less than 80 MHz.
 - if YUV-RGB format conversion is used meanwhile, the pixel clock frequency must be less than 60 MHz.
- If LCD data bus is configured to 16-bit parallel output mode, then
 - pixel clock frequency must be less than 40 MHz.
 - if YUV-RGB format conversion is used meanwhile, the pixel clock frequency must be less than 30 MHz.

26.4.3 Configure Camera as RX Mode

Follow the steps below to configure camera as RX mode via software:

1. Configure clock according to Section 26.3.3. Note that in slave mode, the module clock frequency should be two times faster than the PCLK frequency of the image sensor.
2. Configure signal pins according to Table 26-1.
3. Set or clear `LCD_CAM_CAM_VH_DE_MODE_EN` according to the control signal HSYNC.
4. Set needed RX channel mode and RX data mode, then set the bit `LCD_CAM_CAM_UPDATE`.
5. Reset RX control unit (Camera_Ctrl) and Async Rx FIFO as described in Section 26.3.4.
6. Enable corresponding interrupts, see Section 26.5.
7. Configure GDMA inlink, and set the length of RX data in `LCD_CAM_CAM_REC_DATA_BYTELEN`.
8. Start receiving data:
 - In master mode, when the slave is ready, set `LCD_CAM_CAM_START` to start receiving data.
 - In slave mode, set `LCD_CAM_CAM_START`. Receiving data starts after the master provides clock signal and control signal.
9. Receive data and store the data to the specified address of ESP32-S3 memory. Then corresponding interrupts set in Step 6 will be generated.

Notes:

- No matter in which operation mode, camera master RX mode or camera slave RX mode, the rules below must be followed when accessing internal memory via GDMA:
 - If 8-bit parallel data input mode is selected, then
 - * pixel clock frequency must be less than 80 MHz.

- * if YUV-RGB format conversion is used meanwhile, the pixel clock frequency must be less than 60 MHz.
- If 16-bit parallel data input mode is selected, then
 - * pixel clock frequency must be less than 40 MHz.
 - * if YUV-RGB format conversion is used meanwhile, the pixel clock frequency must be less than 30 MHz.
- If an external camera and an external LCD are connected simultaneously, ensure that the maximum data throughput on the interface is less than GDMA total data bandwidth of 80 MB/s. Note the default frequency of APB_CLK is 80 MHz here. For more information, see Chapter 6 *Reset and Clock*.

26.5 LCD_CAM Interrupts

- LCD_CAM_CAM_HS_INT: triggered when the total number of received lines by camera is greater than or equal to `LCD_CAM_CAM_LINE_INT_NUM + 1`.
- LCD_CAM_CAM_VSYNC_INT: triggered when the camera received a VSYNC signal.
- LCD_CAM_LCD_TRANS_DONE_INT: triggered when the LCD transmitted all the data.
- LCD_CAM_LCD_VSYNC_INT: triggered when the LCD transmitted a VSYNC signal.

26.6 Register Summary

The addresses in this section are relative to LCD_CAM controller base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
LCD configuration registers			
LCD_CAM_LCD_CLOCK_REG	LCD clock configuration register	0x0000	R/W
LCD_CAM_LCD_RGB_YUV_REG	LCD data format conversion register	0x0010	R/W
LCD_CAM_LCD_USER_REG	LCD user configuration register	0x0014	varies
LCD_CAM_LCD_MISC_REG	LCD MISC configuration register	0x0018	varies
LCD_CAM_LCD_CTRL_REG	LCD signal configuration register	0x001C	R/W
LCD_CAM_LCD_CTRL1_REG	LCD signal configuration register 1	0x0020	R/W
LCD_CAM_LCD_CTRL2_REG	LCD signal configuration register 2	0x0024	R/W
LCD_CAM_LCD_CMD_VAL_REG	LCD command value configuration register	0x0028	R/W
LCD_CAM_LCD_DLY_MODE_REG	LCD signal delay configuration register	0x0030	R/W
LCD_CAM_LCD_DATA_DOUT_MODE_REG	LCD data delay configuration register	0x0038	R/W
Camera configuration registers			
LCD_CAM_CAM_CTRL_REG	Camera clock configuration register	0x0004	R/W
LCD_CAM_CAM_CTRL1_REG	Camera control register	0x0008	varies
LCD_CAM_CAM_RGB_YUV_REG	Camera data format conversion register	0x000C	R/W
Interrupt registers			
LCD_CAM_LC_DMA_INT_ENA_REG	LCD_CAM GDMA interrupt enable register	0x0064	R/W
LCD_CAM_LC_DMA_INT_RAW_REG	LCD_CAM GDMA raw interrupt status register	0x0068	RO
LCD_CAM_LC_DMA_INT_ST_REG	LCD_CAM GDMA masked interrupt status register	0x006C	RO
LCD_CAM_LC_DMA_INT_CLR_REG	LCD_CAM GDMA interrupt clear register	0x0070	WO
Version register			
LCD_CAM_LC_REG_DATE_REG	Version control register	0x00FC	R/W

26.7 Registers

The addresses in this section are relative to LCD_CAM controller base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 26.1. LCD_CAM_LCD_CLOCK_REG (0x0000)

LCD_CAM_CLK_EN		LCD_CAM_LCD_CLK_SEL		LCD_CAM_LCD_CLKM_DIV_A		LCD_CAM_LCD_CLKM_DIV_B		LCD_CAM_LCD_CLKM_DIV_NUM		LCD_CAM_LCD_CK_OUT_EDGE		LCD_CAM_LCD_CK_IDLE_EDGE		LCD_CAM_LCD_CLK_EQU_SYSCLK		LCD_CAM_LCD_CLKCNT_N	
31	30	29	28	23	22	17	16	9	8	7	6	5	0				
0	0	0x0		0x0		4		0	0	1	0x3		Reset				

LCD_CAM_LCD_CLKCNT_N $f_{LCD_PCLK} = f_{LCD_CLK} / (LCD_CAM_LCD_CLKCNT_N + 1)$ when **LCD_CAM_LCD_CLK_EQU_SYSCLK** is 0. Note: this field must not be configured to 0. (R/W)

LCD_CAM_LCD_CLK_EQU_SYSCLK 1: $f_{LCD_PCLK} = f_{LCD_CLK}$. 0: $f_{LCD_PCLK} = f_{LCD_CLK} / (LCD_CAM_LCD_CLKCNT_N + 1)$. (R/W)

LCD_CAM_LCD_CK_IDLE_EDGE 1: LCD_PCLK line is high in idle. 0: LCD_PCLK line is low in idle. (R/W)

LCD_CAM_LCD_CK_OUT_EDGE 1: LCD_PCLK is high in the first half clock cycle. 0: LCD_PCLK is low in the first half clock cycle. (R/W)

LCD_CAM_LCD_CLKM_DIV_NUM Integral LCD clock divider value. (R/W)

LCD_CAM_LCD_CLKM_DIV_B Fractional clock divider numerator value. (R/W)

LCD_CAM_LCD_CLKM_DIV_A Fractional clock divider denominator value. (R/W)

LCD_CAM_LCD_CLK_SEL Select LCD module source clock. 0: clock source is disabled. 1: XTAL_CLK. 2: PLL_240M_CLK. 3: PLL_160M_CLK. (R/W)

LCD_CAM_CLK_EN Set this bit to force enable the clock for all configuration registers. Clock gate is not used. (R/W)

Register 26.3. LCD_CAM_LCD_USER_REG (0x0014)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	14	13	12	0	
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0x01	Reset

LCD_CAM_LCD_DOUT_CYCLELEN Configure the cycles for DOUT phase of LCD module. The cycles = this value + 1. (R/W)

LCD_CAM_LCD_ALWAYS_OUT_EN LCD continues outputting data when LCD is in DOUT phase, till **LCD_CAM_LCD_START** is cleared or **LCD_CAM_LCD_RESET** is set. (R/W)

LCD_CAM_LCD_8BITS_ORDER 1: Swap every two data bytes, valid in 8-bit mode. 0: Do not swap. (R/W)

LCD_CAM_LCD_UPDATE 1: Update LCD registers. This bit is cleared by hardware. 0: Do not care. (R/W)

LCD_CAM_LCD_BIT_ORDER 1: Change data bit order. Change LCD_DATA_out[7:0] to LCD_DATA_out[0:7] in 8-bit mode, and bits[15:0] to bits[0:15] in 16-bit mode. 0: Do not change. (R/W)

LCD_CAM_LCD_BYTE_ORDER 1: Invert data byte order, only valid in 16-bit mode. 0: Do not invert. (R/W)

LCD_CAM_LCD_2BYTE_EN 1: The width of output LCD data is 16 bits. 0: The width of output LCD data is 8 bits. (R/W)

LCD_CAM_LCD_DOUT 1: Be able to send data out in LCD sequence when LCD starts. 0: Disable. (R/W)

LCD_CAM_LCD_DUMMY 1: Enable DUMMY phase in LCD sequence when LCD starts. 0: Disable. (R/W)

LCD_CAM_LCD_CMD 1: Be able to send command in LCD sequence when LCD starts. 0: Disable. (R/W)

LCD_CAM_LCD_START LCD starts sending data enable signal, valid in high level. (R/W)

LCD_CAM_LCD_RESET Reset LCD module. (WO)

LCD_CAM_LCD_DUMMY_CYCLELEN Configure DUMMY cycles. DUMMY cycles = this value + 1. (R/W)

LCD_CAM_LCD_CMD_2_CYCLE_EN The cycle length of command phase. 1: 2 cycles. 0: 1 cycle. (R/W)

27 Two-wire Automotive Interface (TWAI®)

27.1 Overview

The Two-wire Automotive Interface (TWAI)® is a multi-master, multi-cast communication protocol with error detection and signaling and inbuilt message priorities and arbitration. The TWAI protocol is suited for automotive and industrial applications (see Section 27.3 for more details).

ESP32-S3 contains a TWAI controller that can be connected to a TWAI bus via an external transceiver. The TWAI controller contains numerous advanced features, and can be utilized in a wide range of use cases such as automotive products, industrial automation controls, building automation etc.

27.2 Features

ESP32-S3 TWAI controller supports the following features:

- Compatible with ISO 11898-1 protocol (CAN Specification 2.0)
- Supports Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID)
- Bit rates from 1 Kbit/s to 1 Mbit/s
- Multiple modes of operation
 - Normal
 - Listen-only (no influence on bus)
 - Self-test (no acknowledgment required during data transmission)
- 64-byte Receive FIFO
- Special transmissions
 - Single-shot transmissions (does not automatically re-transmit upon error)
 - Self Reception (the TWAI controller transmits and receives messages simultaneously)
- Acceptance Filter (supports single and dual filter modes)
- Error detection and handling
 - Error Counters
 - Configurable Error Warning Limit
 - Error Code Capture
 - Arbitration Lost Capture

27.3 Functional Protocol

27.3.1 TWAI Properties

The TWAI protocol connects two or more nodes in a bus network, and allows nodes to exchange messages in a latency bounded manner. A TWAI bus has the following properties.

Single Channel and Non-Return-to-Zero: The bus consists of a single channel to carry bits, thus communication is half-duplex. Synchronization is also implemented in this channel, so extra channels (e.g., clock or enable) are not required. The bit stream of a TWAI message is encoded using the Non-Return-to-Zero (NRZ) method.

Bit Values: The single channel can either be in a dominant or recessive state, representing a logical 0 and a logical 1 respectively. A node transmitting data in a dominant state will always override another node transmitting data in a recessive state. The physical implementation on the bus is left to the application level to decide (e.g., differential pair or a single wire).

Bit Stuffing: Certain fields of TWAI messages are bit-stuffed. A transmitter that transmits five consecutive bits of the same value should automatically insert a complementary bit. Likewise, a receiver that receives five consecutive bits should treat the next bit as a stuffed bit. Bit stuffing is applied to the following fields: SOF, arbitration field, control field, data field, and CRC sequence (see Section 27.3.2 for more details).

Multi-cast: All nodes receive the same bits as they are connected to the same bus. Data is consistent across all nodes unless there is a bus error (see Section 27.3.3 for more details).

Multi-master: Any node can initiate a transmission. If a transmission is already ongoing, a node will wait until the current transmission is over before beginning its own transmission.

Message Priorities and Arbitration: If two or more nodes simultaneously initiate a transmission, the TWAI protocol ensures that one node will win arbitration of the bus. The arbitration field of the message transmitted by each node is used to determine which node will win arbitration.

Error Detection and Signaling: Each node will actively monitor the bus for errors, and signal the detection errors by transmitting an error frame.

Fault Confinement: Each node will maintain a set of error counts that are incremented/decremented according to a set of rules. When the error counts surpass a certain threshold, a node will automatically eliminate itself from the network by switching itself off.

Configurable Bit Rate: The bit rate for a single TWAI bus is configurable. However, all nodes within the same bus must operate at the same bit rate.

Transmitters and Receivers: At any point in time, a TWAI node can either be a transmitter or a receiver.

- A node originating a message is a transmitter. The node remains a transmitter until the bus is idle or until the node loses arbitration. Note that multiple nodes can be transmitters if they have yet to lose arbitration.
- All nodes that are not transmitters are receivers.

27.3.2 TWAI Messages

TWAI nodes use messages to transmit data, and signal errors to other nodes. Messages are split into various frame types, and some frame types will have different frame formats.

The TWAI protocol has of the following frame types:

- Data frames
- Remote frames
- Error frames
- Overload frames

- Interframe space

The TWAI protocol has the following frame formats:

- Standard Frame Format (SFF) that consists of a 11-bit identifier
- Extended Frame Format (EFF) that consists of a 29-bit identifier

27.3.2.1 Data Frames and Remote Frames

Data frames are used by nodes to send data to other nodes, and can have a payload of 0 to 8 data bytes.

Remote frames are used for nodes to request a data frame with the same identifier from another node, thus they do not contain any data bytes. However, data frames and remote frames share many common fields. Figure 27-1 illustrates the fields and sub-fields of different frames and formats.

Figure 27-1. Bit Fields in Data Frames and Remote Frames

Arbitration Field

When two or more nodes transmit a data or remote frame simultaneously, the arbitration field is used to determine which node will win arbitration of the bus. During the arbitration field, if a node transmits a recessive bit while observing a dominant bit, this indicates that another node has overridden its recessive bit. Therefore, the node transmitting the recessive bit has lost arbitration of the bus and should immediately switch to be a receiver.

The arbitration field primarily consists of the frame identifier that is transmitted from the most significant bit first. Given that a dominant bit represents a logical 0, and a recessive bit represents a logical 1:

- A frame with the smallest ID value will always win arbitration.

- Given the same ID and format, data frames will always prevail over remote frames.
- Given the same first 11 bits of ID, a Standard Format Data Frame will prevail over an Extended Format Data Frame due to the SRR being recessive.

Control Field

The control field primarily consists of the DLC (Data Length Code) which indicates the number of payload data bytes for a data frame, or the number of requested data bytes for a remote frame. The DLC is transmitted from the most significant bit first.

Data Field

The data field contains the actual payload data bytes of a data frame. Remote frames do not contain a data field.

CRC Field

The CRC field primarily consists of a CRC sequence. The CRC sequence is a 15-bit cyclic redundancy code calculated from the de-stuffed contents (everything from the SOF to the end of the data field) of a data or remote frame.

ACK Field

The ACK field primarily consists of an ACK Slot and an ACK Delim. The ACK field is mainly intended for the receiver to indicate to a transmitter that it has received an effective message.

Table 27-1. Data Frames and Remote Frames in SFF and EFF

Data/Remote Frames	Description
SOF	The SOF (Start of Frame) is a single dominant bit used to synchronize nodes on the bus.
Base ID	The Base ID (ID.28 to ID.18) is the 11-bit identifier for SFF, or the first 11-bits of the 29-bit identifier for EFF.
RTR	The RTR (Remote Transmission Request) bit indicates whether the message is a data frame (dominant) or a remote frame (recessive). This means that a remote frame will always lose arbitration to a data frame given they have the same ID.
SRR	The SRR (Substitute Remote Request) bit is transmitted in EFF to substitute for the RTR bit at the same position in SFF.
IDE	The IDE (Identifier Extension) bit indicates whether the message is SFF (dominant) or EFF (recessive). This means that a SFF frame will always win arbitration over an EFF frame given they have the same Base ID.
Extd ID	The Extended ID (ID.17 to ID.0) is the remaining 18-bits of the 29-bit identifier for EFF.
r1	The r1 bit (reserved bit 1) is always dominant.
r0	The r0 bit (reserved bit 0) is always dominant.
DLC	The DLC (Data Length Code) is 4-bit long and should contain any value from 0 to 8. Data frames use the DLC to indicate the number of data bytes in the data frame. Remote frames used the DLC to indicate the number of data bytes to request from another node.
Data Bytes	The data payload of data frames. The number of bytes should match the value of DLC. Data byte 0 is transmitted first, and each data byte is transmitted from the most significant bit first.

Cont'd on next page

Table 27-1 – cont'd from previous page

Data/Remote Frames	Description
CRC Sequence	The CRC sequence is a 15-bit cyclic redundancy code.
CRC Delim	The CRC Delim (CRC Delimiter) is a single recessive bit that follows the CRC sequence.
ACK Slot	The ACK Slot (Acknowledgment Slot) is intended for receiver nodes to indicate that the data or remote frame was received without an issue. The transmitter node will send a recessive bit in the ACK Slot and receiver nodes should override the ACK Slot with a dominant bit if the frame was received without errors.
ACK Delim	The ACK Delim (Acknowledgment Delimiter) is a single recessive bit.
EOF	The EOF (End of Frame) marks the end of a data or remote frame, and consists of seven recessive bits.

27.3.2.2 Error and Overload Frames

Error Frames

Error frames are transmitted when a node detects a bus error. Error frames notably consist of an Error Flag which is made up of 6 consecutive bits of the same value, thus violating the bit-stuffing rule. Therefore, when a particular node detects a bus error and transmits an error frame, all other nodes will then detect a stuff error and transmit their own error frames in response. This has the effect of propagating the detection of a bus error across all nodes on the bus.

When a node detects a bus error, it will transmit an error frame starting from the next bit. However, if the type of bus error was a CRC error, then the error frame will start at the bit following the ACK Delim (see Section 27.3.3 for more details). The following Figure 27-2 shows different fields of an error frame:

Figure 27-2. Fields of an Error Frame

Table 27-2. Error Frame

Error Frame	Description
Error Flag	The Error Flag has two forms, the Active Error Flag consisting of 6 dominant bits and the Passive Error Flag consisting of 6 recessive bits (unless overridden by dominant bits of other nodes). Active Error Flags are sent by error active nodes, whilst Passive Error Flags are sent by error passive nodes.
Error Flag Superposition	The Error Flag Superposition field meant to allow for other nodes on the bus to transmit their respective Active Error Flags. The superposition field can range from 0 to 6 bits, and ends when the first recessive bit is detected (i.e., the first bit of the Delimiter).
Error Delimiter	The Delimiter field marks the end of the error/overload frame, and consists of 8 recessive bits.

Overload Frames

An overload frame has the same bit fields as an error frame containing an Active Error Flag. The key difference is in the conditions that can trigger the transmission of an overload frame. Figure 27-3 below shows the bit fields of an overload frame.

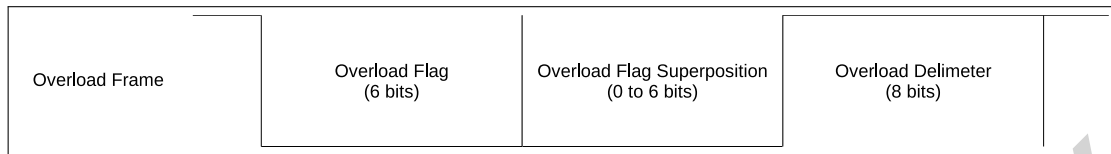

Figure 27-3. Fields of an Overload Frame

Table 27-3. Overload Frame

Overload Flag	Description
Overload Flag	Consists of 6 dominant bits. Same as an Active Error Flag.
Overload Flag Superposition	Allows for the superposition of Overload Flags from other nodes, similar to an Error Flag Superposition.
Overload Delimiter	Consists of 8 recessive bits. Same as an Error Delimiter.

Overload frames will be transmitted under the following conditions:

1. A receiver requires a delay of the next data or remote frame.
2. A dominant bit is detected at the first and second bit of intermission.
3. A dominant bit is detected at the eighth (last) bit of an Error Delimiter. Note that in this case, TEC and REC will not be incremented (see Section 27.3.3 for more details).

Transmitting an overload frame due to one of the conditions must also satisfy the following rules:

- Transmitting an overload frame due to condition 1 must only be started at the first bit of intermission.
- Transmitting an overload frame due to condition 2 and 3 must start one bit after the detecting the dominant bit of the condition.
- A maximum of two overload frames may be generated in order to delay the next data or remote frame.

27.3.2.3 Interframe Space

The Interframe Space acts as a separator between frames. Data frames and remote frames must be separated from preceding frames by an Interframe Space, regardless of the preceding frame's type (data frame, remote frame, error frame, overload frame). However, error frames and overload frames do not need to be separated from preceding frames.

Figure 27-4 shows the fields within an Interframe Space:

Table 27-4. Interframe Space

Interframe Space	Description
Intermission	The Intermission consists of 3 recessive bits.

Cont'd on next page

Table 27-4 – cont'd from previous page

Interframe Space	Description
Suspend Transmission	An Error Passive node that has just transmitted a message must include a Suspend Transmission field. This field consists of 8 recessive bits. Error Active nodes should not include this field.
Bus Idle	The Bus Idle field is of arbitrary length. Bus Idle ends when an SOF is transmitted. If a node has a pending transmission, the SOF should be transmitted at the first bit following Intermission.

27.3.3 TWAI Errors

27.3.3.1 Error Types

Bus Errors in TWAI are categorized into one of the following types:

Bit Error

A Bit Error occurs when a node transmits a bit value (i.e., dominant or recessive) but the opposite bit is detected (e.g., a dominant bit is transmitted but a recessive is detected). However, if the transmitted bit is recessive and is located in the Arbitration Field or ACK Slot or Passive Error Flag, then detecting a dominant bit will not be considered a Bit Error.

Stuff Error

A stuff error is detected when 6 consecutive bits of the same value are detected (thus violating the bit-stuffing encoding rules).

CRC Error

A receiver of a data or remote frame will calculate a CRC based on the bits it has received. A CRC error occurs when the CRC calculated by the receiver does not match the CRC sequence in the received data or remote Frame.

Format Error

A Format Error is detected when a fixed-form bit field of a message contains an illegal bit. For example, the r1 and r0 fields must be dominant.

ACK Error

An ACK Error occurs when a transmitter does not detect a dominant bit at the ACK Slot.

27.3.3.2 Error States

TWAI nodes implement fault confinement by each maintaining two error counters, where the counter values determine the error state. The two error counters are known as the Transmit Error Counter (TEC) and Receive Error Counter (REC). TWAI has the following error states.

Error Active

An Error Active node is able to participate in bus communication and transmit an Active Error Flag when it detects an error.

Error Passive

An Error Passive node is able to participate in bus communication, but can only transmit an Passive Error Flag when it detects an error. Error Passive nodes that have transmitted a data or remote frame must also include the Suspend Transmission field in the subsequent Interframe Space.

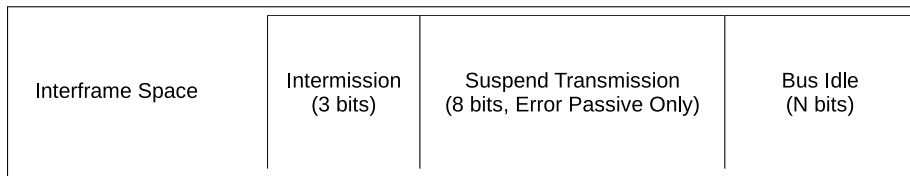

Figure 27-4. The Fields within an Interframe Space

Bus Off

A Bus Off node is not permitted to influence the bus in any way (i.e., is not allowed to transmit anything).

27.3.3.3 Error Counters

The TEC and REC are incremented/decremented according to the following rules. **Note that more than one rule can apply for a given message transfer.**

1. When a receiver detects an error, the REC is increased by 1, except when the detected error was a Bit Error during the transmission of an Active Error Flag or an Overload Flag.
2. When a receiver detects a dominant bit as the first bit after sending an Error Flag, the REC is increased by 8.
3. When a transmitter sends an Error Flag, the TEC is increased by 8. However, the following scenarios are exempt from this rule:
 - If a transmitter is Error Passive that detects an Acknowledgment Error due to not detecting a dominant bit in the ACK Slot, it should send a Passive Error Flag. If no dominant bit is detected in that Passive Error Flag, the TEC should not be increased.
 - A transmitter transmits an Error Flag due to a Stuff Error during Arbitration. If the offending bit should have been recessive but was monitored as dominant, then the TEC should not be increased.
4. If a transmitter detects a Bit Error whilst sending an Active Error Flag or Overload Flag, the TEC is increased by 8.
5. If a receiver detects a Bit Error while sending an Active Error Flag or Overload Flag, the REC is increased by 8.
6. A node can tolerate up to 7 consecutive dominant bits after sending an Active/Passive Error Flag, or Overload Flag. After detecting the 14th consecutive dominant bit (when sending an Active Error Flag or Overload Flag), or the 8th consecutive dominant bit following a Passive Error Flag, a transmitter will increase its TEC by 8 and a receiver will increase its REC by 8. Every additional eight consecutive dominant bits will also increase the TEC (for transmitters) or REC (for receivers) by 8 as well.
7. When a transmitter successfully transmits a message (getting ACK and no errors until the EOF is complete), the TEC is decremented by 1, unless the TEC is already at 0.
8. When a receiver successfully receives a message (no errors before ACK Slot, and successful sending of ACK), the REC is decremented.
 - If the REC was between 1 and 127, the REC is decremented by 1.
 - If the REC was greater than 127, the REC is set to 127.
 - If the REC was 0, the REC remains 0.

9. A node becomes Error Passive when its TEC and/or REC is greater than or equal to 128. The error condition that causes a node to become Error Passive will cause the node to send an Active Error Flag. Note that once the REC has reached to 128, any further increases to its value are invalid until the REC returns to a value less than 128.
10. A node becomes Bus Off when its TEC is greater than or equal to 256.
11. An Error Passive node becomes Error Active when both the TEC and REC are less than or equal to 127.
12. A Bus Off node can become Error Active (with both its TEC and REC reset to 0) after it monitors 128 occurrences of 11 consecutive recessive bits on the bus.

27.3.4 TWAI Bit Timing

27.3.4.1 Nominal Bit

The TWAI protocol allows a TWAI bus to operate at a particular bit rate. However, all nodes within a TWAI bus must operate at the same bit rate.

- **The Nominal Bit Rate** is defined as the number of bits transmitted per second from an ideal transmitter and without any synchronization.
- **The Nominal Bit Time** is defined as $1/\text{Nominal Bit Rate}$.

A single Nominal Bit Time is divided into multiple segments, and each segment is made up of multiple Time Quanta. A **Time Quantum** is a fixed unit of time, and is implemented as some form of prescaled clock signal in each node. Figure 27-5 illustrates the segments within a single Nominal Bit Time.

TWAI controllers will operate in time steps of one Time Quanta where the state of the TWAI bus is analyzed. If two consecutive Time Quantas have different bus states (i.e., recessive to dominant or vice versa), this will be considered an edge. When the bus is analyzed at the intersection of PBS1 and PBS2, this is considered the Sample Point and the sampled bus value is considered the value of that bit.

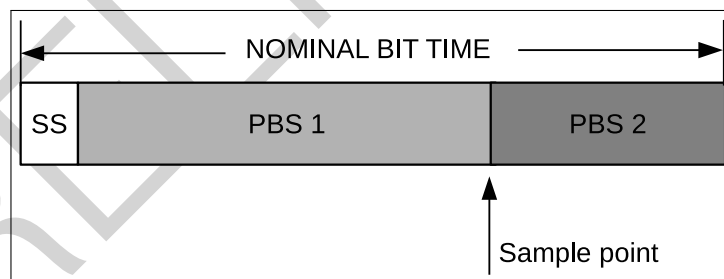

Figure 27-5. Layout of a Bit

Table 27-5. Segments of a Nominal Bit Time

Segment	Description
SS	The SS (Synchronization Segment) is 1 Time Quantum long. If all nodes are perfectly synchronized, the edge of a bit will lie in the SS.
PBS1	PBS1 (Phase Buffer Segment 1) can be 1 to 16 Time Quanta long. PBS1 is meant to compensate for the physical delay times within the network. PBS1 can also be lengthened for synchronization purposes.

Cont'd on next page

Table 27-5 – cont'd from previous page

Segment	Description
PBS2	PBS2 (Phase Buffer Segment 2) can be 1 to 8 Time Quanta long. PBS2 is meant to compensate for the information processing time of nodes. PBS2 can also be shortened for synchronization purposes.

27.3.4.2 Hard Synchronization and Resynchronization

Due to clock skew and jitter, the bit timing of nodes on the same bus may become out of phase. Therefore, a bit edge may come before or after the SS. To ensure that the internal bit timing clocks of each node are kept in phase, TWAI has various methods of synchronization. The **Phase Error “e”** is measured in the number of Time Quanta and relative to the SS.

- A positive Phase Error ($e > 0$) is when the edge lies after the SS and before the Sample Point (i.e., the edge is late).
- A negative Phase Error ($e < 0$) is when the edge lies after the Sample Point of the previous bit and before SS (i.e., the edge is early).

To correct for Phase Errors, there are two forms of synchronization, known as **Hard Synchronization** and **Resynchronization**. **Hard Synchronization** and **Resynchronization** obey the following rules:

- Only one synchronization may occur in a single bit time.
- Synchronizations only occurs on recessive to dominant edges.

Hard Synchronization

Hard Synchronization occurs on the recessive to dominant edges when the bus is idle (i.e., the first SOF bit after Bus Idle). All nodes will restart their internal bit timings so that the recessive to dominant edge lies within the SS of the restarted bit timing.

Resynchronization

Resynchronization occurs on recessive to dominant edges not during Bus Idle. If the edge has a positive Phase Error ($e > 0$), PBS1 is lengthened by a certain number of Time Quanta. If the edge has a negative Phase Error ($e < 0$), PBS2 will be shortened by a certain number of Time Quanta.

The number of Time Quanta to lengthen or shorten depends on the magnitude of the Phase Error, and is also limited by the Synchronization Jump Width (SJW) value which is programmable.

- When the magnitude of the Phase Error (**e**) is less than or equal to the SJW, PBS1/PBS2 are lengthened/shortened by the **e** number of Time Quanta. This has a same effect as Hard Synchronization.
- When the magnitude of the Phase Error is greater to the SJW, PBS1/PBS2 are lengthened/shortened by the SJW number of Time Quanta. This means it may take multiple bits of synchronization before the Phase Error is entirely corrected.

27.4 Architectural Overview

The major functional blocks of the TWAI controller are shown in Figure 27-6.

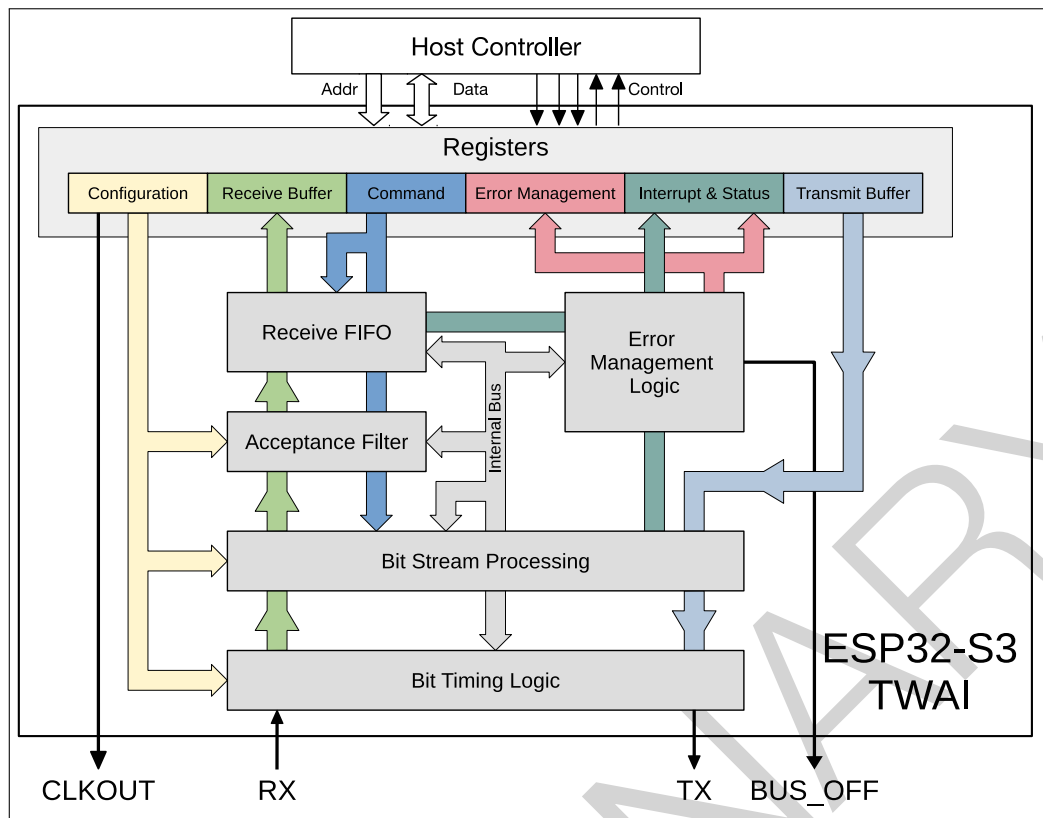

Figure 27-6. TWAI Overview Diagram

27.4.1 Registers Block

The ESP32-S3 CPU accesses peripherals using 32-bit aligned words. However, the majority of registers in the TWAI controller only contain useful data at the least significant byte (bits [7:0]). Therefore, in these registers, bits [31:8] are ignored on writes, and return 0 on reads.

Configuration Registers

The configuration registers store various configuration items for the TWAI controller such as bit rates, operation mode, Acceptance Filter etc. Configuration registers can only be modified whilst the TWAI controller is in Reset Mode (See Section 27.5.1).

Command Registers

The command register is used by the CPU to drive the TWAI controller to initiate certain actions such as transmitting a message or clearing the Receive Buffer. The command register can only be modified when the TWAI controller is in Operation Mode (see section 27.5.1).

Interrupt & Status Registers

The interrupt register indicates what events have occurred in the TWAI controller (each event is represented by a separate bit). The status register indicates the current status of the TWAI controller.

Error Management Registers

The error management registers include error counters and capture registers. The error counter registers represent TEC and REC values. The capture registers will record information about instances where TWAI controller detects a bus error, or when it loses arbitration.

Transmit Buffer Registers

The transmit buffer is a 13-byte buffer used to store a TWAI message to be transmitted.

Receive Buffer Registers

The Receive Buffer is a 13-byte buffer which stores a single message. The Receive Buffer acts as a window of Receive FIFO, whose first message will be mapped into the Receive Buffer.

Note that the Transmit Buffer registers, Receive Buffer registers, and the Acceptance Filter registers share the same address range (offset 0x0040 to 0x0070). Their access is governed by the following rules:

- When the TWAI controller is in Reset Mode, all reads and writes to the address range maps to the Acceptance Filter registers.
- When the TWAI controller is in Operation Mode:
 - All reads to the address range maps to the Receive Buffer registers.
 - All writes to the address range maps to the Transmit Buffer registers.

27.4.2 Bit Stream Processor

The Bit Stream Processing (BSP) module frames data from the Transmit Buffer (e.g. bit stuffing and additional CRC fields) and generating a bit stream for the Bit Timing Logic (BTL) module. At the same time, the BSP module is also responsible for processing the received bit stream (e.g., de-stuffing and verifying CRC) from the BTL module and placing the message into the Receive FIFO. The BSP will also detect errors on the TWAI bus and report them to the Error Management Logic (EML).

27.4.3 Error Management Logic

The Error Management Logic (EML) module updates the TEC and REC, recording error information like error types and positions, and updating the error state of the TWAI controller such that the BSP module generates the correct Error Flags. Furthermore, this module also records the bit position when the TWAI controller loses arbitration.

27.4.4 Bit Timing Logic

The Bit Timing Logic (BTL) module transmits and receives messages at the configured bit rate. The BTL module also handles synchronization of out of phase bits so that communication remains stable. A single bit time consists of multiple programmable segments that allows users to set the length of each segment to account for factors such as propagation delay and controller processing time etc.

27.4.5 Acceptance Filter

The Acceptance Filter is a programmable message filtering unit that allows the TWAI controller to accept or reject a received message based on the message's ID field. Only accepted messages will be stored in the Receive FIFO. The Acceptance Filter's registers can be programmed to specify a single filter, or two separate filters (dual filter mode).

27.4.6 Receive FIFO

The Receive FIFO is a 64-byte buffer (inside the TWAI controller) that stores received messages accepted by the Acceptance Filter. Messages in the Receive FIFO can vary in size (between 3 to 13-bytes). When the Receive FIFO is full (or does not have enough space to store the next received message in its entirety), the Overrun Interrupt will be triggered, and any subsequent received messages will be lost until adequate space is cleared in the Receive FIFO. The first message in the Receive FIFO will be mapped to the 13-byte Receive Buffer until that

message is cleared (using the Release Receive Buffer command bit). After clearing, the Receive Buffer will map to the next message in the Receive FIFO, and the space occupied by the previous message in the Receive FIFO can be used to receive new messages.

27.5 Functional Description

27.5.1 Modes

The ESP32-S3 TWAI controller has two working modes: Reset Mode and Operation Mode. Reset Mode and Operation Mode are entered by setting or clearing the `TWAI_RESET_MODE` bit.

27.5.1.1 Reset Mode

Entering Reset Mode is required in order to modify the various configuration registers of the TWAI controller. When entering Reset Mode, the TWAI controller is essentially disconnected from the TWAI bus. When in Reset Mode, the TWAI controller will not be able to transmit any messages (including error signals). Any transmission in progress is immediately terminated. Likewise, the TWAI controller will not be able to receive any messages either.

27.5.1.2 Operation Mode

In operation mode, the TWAI controller connects to the bus and write-protect all configuration registers to ensure consistency during operation. When in Operation Mode, the TWAI controller can transmit and receive messages (including error signaling) depending on which operation sub-mode the TWAI controller was configured with. The TWAI controller supports the following operation sub-modes:

- **Normal Mode:** The TWAI controller can transmit and receive messages including error signaling (such as error and overload Frames).
- **Self-test Mode:** Self-test mode is similar to normal Mode, but the TWAI controller will consider the transmission of a data or RTR frame successful and do not generate ACK error even if it was not acknowledged. This is commonly used when self-testing the TWAI controller.
- **Listen-only Mode:** The TWAI controller will be able to receive messages, but will remain completely passive on the TWAI bus. Thus, the TWAI controller will not be able to transmit any messages, acknowledgments, or error signals. The error counters will remain frozen. This mode is useful for TWAI bus monitoring.

Note that when exiting Reset Mode (i.e., entering Operation Mode), the TWAI controller must wait for 11 consecutive recessive bits to occur before being able to fully connect the TWAI bus (i.e., be able to transmit or receive).

27.5.2 Bit Timing

The operating bit rate of the TWAI controller must be configured whilst the TWAI controller is in Reset Mode. The bit rate is configured using `TWAI_BUS_TIMING_0_REG` and `TWAI_BUS_TIMING_1_REG`, and the two registers contain the following fields:

The following Table 27-6 illustrates the bit fields of `TWAI_BUS_TIMING_0_REG`.

Table 27-6. Bit Information of TWAI_BUS_TIMING_0_REG (0x18)

Bit 31-16	Bit 15	Bit 14	Bit 13	Bit 12	Bit 1	Bit 0
Reserved	SJW.1	SJW.0	Reserved	BRP.12	BRP.1	BRP.0

Notes:

- BRP: The TWAI Time Quanta clock is derived from the APB clock that is usually 80 MHz. The Baud Rate Prescaler (BRP) field is used to define the prescaler according to the equation below, where t_{Tq} is the Time Quanta clock cycle and t_{CLK} is APB clock cycle:

$$t_{Tq} = 2 \times t_{CLK} \times (2^{12} \times \text{BRP.12} + 2^{11} \times \text{BRP.11} + \dots + 2^1 \times \text{BRP.1} + 2^0 \times \text{BRP.0} + 1)$$
- SJW: Synchronization Jump Width (SJW) is configured in SJW.0 and SJW.1 where $\text{SJW} = (2 \times \text{SJW.1} + \text{SJW.0} + 1)$

The following Table 27-7 illustrates the bit fields of TWAI_BUS_TIMING_1_REG.

Table 27-7. Bit Information of TWAI_BUS_TIMING_1_REG (0x1c)

Bit 31-8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reserved	SAM	PBS2.2	PBS2.1	PBS2.0	PBS1.3	PBS1.2	PBS1.1	PBS1.0

Notes:

- PBS1: The number of Time Quanta in Phase Buffer Segment 1 is defined according to the following equation: $(8 \times \text{PBS1.3} + 4 \times \text{PBS1.2} + 2 \times \text{PBS1.1} + \text{PBS1.0} + 1)$
- PBS2: The number of Time Quanta in Phase Buffer Segment 2 is defined according to the following equation: $(4 \times \text{PBS2.2} + 2 \times \text{PBS2.1} + \text{PBS2.0} + 1)$
- SAM: Enables triple sampling if set to 1. This is useful for low/medium speed buses to filter spikes on the bus line.

27.5.3 Interrupt Management

The ESP32-S3 TWAI controller provides eight interrupts, each represented by a single bit in the TWAI_INT_RAW_REG. For a particular interrupt to be triggered, the corresponding enable bit in TWAI_INT_ENA_REG must be set.

The TWAI controller provides the following interrupts:

- Receive Interrupt
- Transmit Interrupt
- Error Warning Interrupt
- Data Overrun Interrupt
- Error Passive Interrupt
- Arbitration Lost Interrupt
- Bus Error Interrupt
- Bus Status Interrupt

The TWAI controller's interrupt signal to the interrupt matrix will be asserted whenever one or more interrupt bits are set in the TWAI_INT_RAW_REG, and deasserted when all bits in TWAI_INT_RAW_REG are cleared. The

majority of interrupt bits in [TWAI_INT_RAW_REG](#) are automatically cleared when the register is read, except for the Receive Interrupt which can only be cleared when all the messages are released by setting the [TWAI_RELEASE_BUF](#) bit.

27.5.3.1 Receive Interrupt (RXI)

The Receive Interrupt (RXI) is asserted whenever the TWAI controller has received messages that are pending to be read from the Receive Buffer (i.e., when [TWAI_RX_MESSAGE_CNT_REG](#) > 0). Pending received messages includes valid messages in the Receive FIFO and also overrun messages. The RXI will not be deasserted until all pending received messages are cleared using the [TWAI_RELEASE_BUF](#) command bit.

27.5.3.2 Transmit Interrupt (TXI)

The Transmit Interrupt (TXI) is triggered whenever Transmit Buffer becomes free, indicating another message can be loaded into the Transmit Buffer to be transmitted. The Transmit Buffer becomes free under the following scenarios:

- A message transmission has completed successfully, i.e., acknowledged without any errors. (Any failed messages will automatically be resent.)
- A single shot transmission has completed (successfully or unsuccessfully, indicated by the [TWAI_TX_COMPLETE](#) bit).
- A message transmission was aborted using the [TWAI_ABORT_TX](#) command bit.

27.5.3.3 Error Warning Interrupt (EWI)

The Error Warning Interrupt (EWI) is triggered whenever there is a change to the [TWAI_ERR_ST](#) and [TWAI_BUS_OFF_ST](#) bits of the [TWAI_STATUS_REG](#) (i.e., transition from 0 to 1 or vice versa). Thus, an EWI could indicate one of the following events, depending on the values [TWAI_ERR_ST](#) and [TWAI_BUS_OFF_ST](#) at the moment when the EWI is triggered.

- If [TWAI_ERR_ST](#) = 0 and [TWAI_BUS_OFF_ST](#) = 0:
 - If the TWAI controller was in the Error Active state, it indicates both the TEC and REC have returned below the threshold value set by [TWAI_ERR_WARNING_LIMIT_REG](#).
 - If the TWAI controller was previously in the Bus Off Recovery state, it indicates that Bus Recovery has completed successfully.
- If [TWAI_ERR_ST](#) = 1 and [TWAI_BUS_OFF_ST](#) = 0: The TEC or REC error counters have exceeded the threshold value set by [TWAI_ERR_WARNING_LIMIT_REG](#).
- If [TWAI_ERR_ST](#) = 1 and [TWAI_BUS_OFF_ST](#) = 1: The TWAI controller has entered the BUS_OFF state (due to the TEC >= 256).
- If [TWAI_ERR_ST](#) = 0 and [TWAI_BUS_OFF_ST](#) = 1: The TWAI controller's TEC has dropped below the threshold value set by [TWAI_ERR_WARNING_LIMIT_REG](#) during BUS_OFF recovery.

27.5.3.4 Data Overrun Interrupt (DOI)

The Data Overrun Interrupt (DOI) is triggered whenever the Receive FIFO has overrun. The DOI indicates that the Receive FIFO is full and should be cleared immediately to prevent any further overrun messages.

The DOI is only triggered by the first message that causes the Receive FIFO to overrun (i.e., the transition from the Receive FIFO not being full to the Receive FIFO overflowing). Any subsequent overrun messages will not trigger the DOI again. The DOI could be triggered again when all received messages (valid or overrun) have been cleared.

27.5.3.5 Error Passive Interrupt (TXI)

The Error Passive Interrupt (EPI) is triggered whenever the TWAI controller switches from Error Active to Error Passive, or vice versa.

27.5.3.6 Arbitration Lost Interrupt (ALI)

The Arbitration Lost Interrupt (ALI) is triggered whenever the TWAI controller is attempting to transmit a message and loses arbitration. The bit position where the TWAI controller lost arbitration is automatically recorded in Arbitration Lost Capture register (TWAI_ARB_LOST_CAP_REG). When the ALI occurs again, the Arbitration Lost Capture register will no longer record new bit location until it is cleared (via reading this register through the CPU).

27.5.3.7 Bus Error Interrupt (BEI)

The Bus Error Interrupt (BEI) is triggered whenever TWAI controller detects an error on the TWAI bus. When a bus error occurs, the Bus Error type and its bit position are automatically recorded in the Error Code Capture register (TWAI_ERR_CODE_CAP_REG). When the BEI occurs again, the Error Code Capture register will no longer record new error information until it is cleared (via a read from the CPU).

27.5.3.8 Bus Status Interrupt (BSI)

The Bus Status Interrupt (BSI) is triggered whenever TWAI controller is switching between receive/transmit status and idle status. When a BSI occurs, the current status of TWAI controller can be measured by reading TWAI_RX_ST and TWAI_TX_ST in TWAI_STATUS_REG register.

27.5.4 Transmit and Receive Buffers

27.5.4.1 Overview of Buffers

Table 27-8. Buffer Layout for Standard Frame Format and Extended Frame Format

Standard Frame Format (SFF)		Extended Frame Format (EFF)	
TWAI Address	Content	TWAI Address	Content
0x40	TX/RX frame information	0x40	TX/RX frame information
0x44	TX/RX identifier 1	0x44	TX/RX identifier 1
0x48	TX/RX identifier 2	0x48	TX/RX identifier 2
0x4c	TX/RX data byte 1	0x4c	TX/RX identifier 3
0x50	TX/RX data byte 2	0x50	TX/RX identifier 4
0x54	TX/RX data byte 3	0x54	TX/RX data byte 1
0x58	TX/RX data byte 4	0x58	TX/RX data byte 2
0x5c	TX/RX data byte 5	0x5c	TX/RX data byte 3

Cont'd on next page

Table 27-8 – cont'd from previous page

Standard Frame Format (SFF)		Extended Frame Format (EFF)	
TWAI Address	Content	TWAI Address	Content
0x60	TX/RX data byte 6	0x60	TX/RX data byte 4
0x64	TX/RX data byte 7	0x64	TX/RX data byte 5
0x68	TX/RX data byte 8	0x68	TX/RX data byte 6
0x6c	reserved	0x6c	TX/RX data byte 7
0x70	reserved	0x70	TX/RX data byte 8

Table 27-8 illustrates the layout of the Transmit Buffer and Receive Buffer registers. Both the Transmit and Receive Buffer registers share the same address space and are only accessible when the TWAI controller is in Operation Mode. CPU write operations access the Transmit Buffer registers, and CPU read operations access the Receive Buffer registers. However, both buffers share the exact same register layout and fields to represent a message (received or to be transmitted). The Transmit Buffer registers are used to configure a TWAI message to be transmitted. The CPU would write to the Transmit Buffer registers specifying the message's frame type, frame format, frame ID, and frame data (payload). Once the Transmit Buffer is configured, the CPU would then initiate the transmission by setting the `TWAI_TX_REQ` bit in `TWAI_CMD_REG`.

- For a self-reception request, set the `TWAI_SELF_RX_REQ` bit instead.
- For a single-shot transmission, set both the `TWAI_TX_REQ` and the `TWAI_ABORT_TX` simultaneously.

The Receive Buffer registers map the first message in the Receive FIFO. The CPU would read the Receive Buffer registers to obtain the first message's frame type, frame format, frame ID, and frame data (payload). Once the message has been read from the Receive Buffer registers, the CPU can set the `TWAI_RELEASE_BUF` bit in `TWAI_CMD_REG` to clear the Receive Buffer registers. If there are still messages in the Receive FIFO, the Receive Buffer registers will map the first message again.

27.5.4.2 Frame Information

The frame information is one byte long and specifies a message's frame type, frame format, and length of data. The frame information fields are shown in Table 27-9.

Table 27-9. TX/RX Frame Information (SFF/EFF) TWAI Address 0x40

Bit 31-8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reserved	FF ¹	RTR ²	X ³	X ³	DLC.3 ⁴	DLC.2 ⁴	DLC.1 ⁴	DLC.0 ⁴

Notes:

1. FF: The Frame Format (FF) bit specifies whether the message is Extended Frame Format (EFF) or Standard Frame Format (SFF). The message is EFF when FF bit is 1, and SFF when FF bit is 0.
2. RTR: The Remote Transmission Request (RTR) bit specifies whether the message is a data frame or a remote frame. The message is a remote frame when the RTR bit is 1, and a data frame when the RTR bit is 0.
3. X: Don't care, can be any value.
4. DLC: The Data Length Code (DLC) field specifies the number of data bytes for a data frame, or the number of data bytes to request in a remote frame. TWAI data frames are limited to a maximum payload of 8 data bytes.

bytes, and thus the DLC should range anywhere from 0 to 8.

27.5.4.3 Frame Identifier

The Frame Identifier fields is two-byte (11-bit) long if the message is SFF, and four-byte (29-bit) long if the message is EFF.

The Frame Identifier fields for an SFF (11-bit) message is shown in Table 27-10-27-11.

Table 27-10. TX/RX Identifier 1 (SFF); TWAI Address 0x44

Bit 31-8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reserved	ID.10	ID.9	ID.8	ID.7	ID.6	ID.5	ID.4	ID.3

Table 27-11. TX/RX Identifier 2 (SFF); TWAI Address 0x48

Bit 31-8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reserved	ID.2	ID.1	ID.0	X ¹	X ²	X ²	X ²	X ²

Notes:

1. Don't care. Recommended to be compatible with receive buffer (i.e., set to RTR) in case of using the self reception functionality (or together with self-test functionality).
2. Don't care. Recommended to be compatible with receive buffer (i.e., set to 0) in case of using the self reception functionality (or together with self-test functionality).

The Frame Identifier fields for an EFF (29-bits) message is shown in Table 27-12-27-15.

Table 27-12. TX/RX Identifier 1 (EFF); TWAI Address 0x44

Bit 31-8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

Notes:

1. Don't care. Recommended to be compatible with receive buffer (i.e., set to RTR) in case of using the self reception functionality (or together with self-test functionality).
2. Don't care. Recommended to be compatible with receive buffer (i.e., set to 0) in case of using the self reception functionality (or together with self-test functionality).

27.5.4.4 Frame Data

The Frame Data field contains the payloads of transmitted or received data frame, and can range from 0 to eight bytes. The number of valid bytes should be equal to the DLC. However, if the DLC is larger than eight, the number of valid bytes would still be limited to eight. Remote frames do not have data payloads, thus their Frame Data fields will be unused.

For example, when transmitting a data frame with five bytes, the CPU should write five to the DLC field, and then write data to the corresponding register of the first to the fifth data field. Likewise, when receiving a data frame with a DLC of five data bytes, only the first to the fifth data byte will contain valid payload data for the CPU to read.

27.5.5 Receive FIFO and Data Overruns

The Receive FIFO is a 64-byte internal buffer used to store received messages in First In First Out order. A single received message can occupy between three to 13 bytes of space in the Receive FIFO, and their endianness is identical to the register layout of the Receive Buffer registers. The Receive Buffer registers are mapped to the bytes of the first message in the Receive FIFO.

When the TWAI controller receives a message, it will increment the value of [TWAI_RX_MESSAGE_COUNTER](#) up to a maximum of 64. If there is adequate space in the Receive FIFO, the message contents will be written into the Receive FIFO. Once a message has been read from the Receive Buffer, the [TWAI_RELEASE_BUF](#) bit should be set. This will decrement [TWAI_RX_MESSAGE_COUNTER](#) and free the space occupied by the first message in the Receive FIFO. The Receive Buffer will then map to the next message in the Receive FIFO.

A data overrun occurs when the TWAI controller receives a message, but the Receive FIFO lacks the adequate free space to store the received message in its entirety (either due to the message contents being larger than the free space in the Receive FIFO, or the Receive FIFO being completely full).

When a data overrun occurs:

- The free space left in the Receive FIFO is filled with the partial contents of the overrun message. If the Receive FIFO is already full, then none of the overrun message's contents will be stored.
- When data in the Receive FIFO overruns for the first time, a Data Overrun Interrupt will be triggered.
- Each overrun message will still increment the [TWAI_RX_MESSAGE_COUNTER](#) up to a maximum of 64.
- The RX FIFO will internally mark overrun messages as invalid. The [TWAI_MISS_ST](#) bit can be used to determine whether the message currently mapped to by the Receive Buffer is valid or overrun.

To clear an overrun Receive FIFO, the [TWAI_RELEASE_BUF](#) must be called repeatedly until [TWAI_RX_MESSAGE_COUNTER](#) is 0. This has the effect of freeing all valid messages in the Receive FIFO and clearing all overrun messages.

The Acceptance Filter allows the TWAI controller to filter out received messages based on their ID (and optionally their first data byte and frame type). Only accepted messages are passed on to the Receive FIFO. The use of

Acceptance Filters allows a more lightweight operation of the TWAI controller (e.g., less use of Receive FIFO, fewer Receive Interrupts) since the TWAI Controller only need to handle a subset of messages.

The Acceptance Filter configuration registers can only be accessed whilst the TWAI controller is in Reset Mode, since they share the same address spaces as the Transmit Buffer and Receive Buffer registers.

The configuration registers consist of a 32-bit Acceptance Code Value and a 32-bit Acceptance Mask Value. The Acceptance Code value specifies a bit pattern which each filtered bit of the message must match in order for the message to be accepted. The Acceptance Mask Value is able to mask out certain bits of the Code value (i.e., set as “Don’t Care” bits). Each filtered bit of the message must either match the acceptance code or be masked in order for the message to be accepted, as demonstrated in Figure 27-7.

Figure 27-7. Acceptance Filter

The TWAI controller Acceptance Filter allows the 32-bit Acceptance Code and Mask Values to either define a single filter (i.e., Single Filter Mode), or two filters (i.e., Dual Filter Mode). How the Acceptance Filter interprets the 32-bit code and mask values is dependent on whether Single Filter Mode is enabled, and the received message format (i.e., SFF or EFF).

27.5.5.1 Single Filter Mode

Single Filter Mode is enabled by setting the `TWAI_RX_FILTER_MODE` bit to 1. This will cause the 32-bit code and mask values to define a single filter. The single filter can filter the following bits of a data or remote frame:

- SFF
 - The entire 11-bit ID
 - RTR bit
 - Data byte 1 and Data byte 2
- EFF
 - The entire 29-bit ID
 - RTR bit

The following Figure 27-8 illustrates how the 32-bit code and mask values will be interpreted under Single Filter Mode.

27.5.5.2 Dual Filter Mode

Dual Filter Mode is enabled by clearing the `TWAI_RX_FILTER_MODE` bit to 0. This will cause the 32-bit code and mask values to define a two separate filters referred to as filter 1 or filter 2. Under Dual Filter Mode, a message will be accepted if it is accepted by one of the two filters.

The two filters can filter the following bits of a data or remote frame:

- SFF

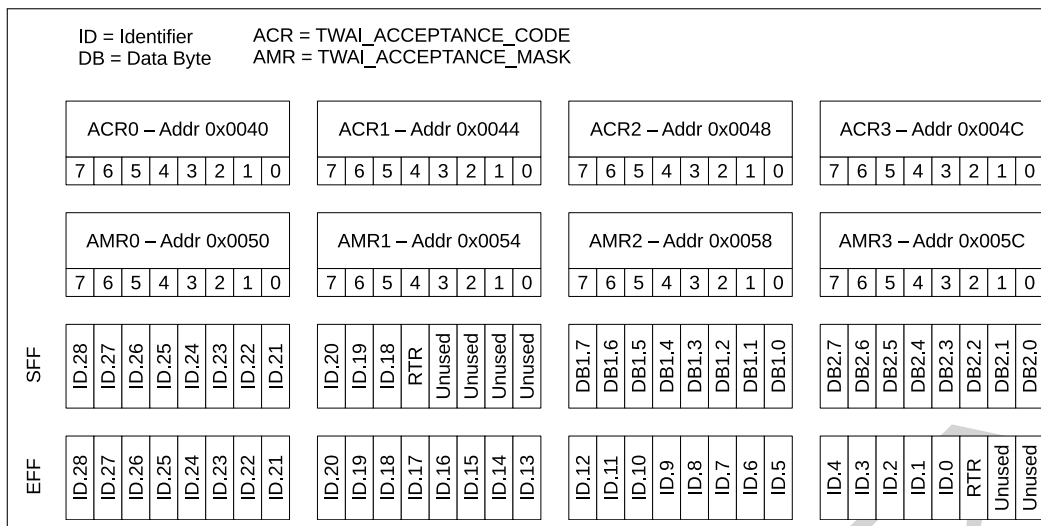

Figure 27-8. Single Filter Mode

- The entire 11-bit ID
- RTR bit
- Data byte 1 (for filter 1 only)
- EFF
 - The first 16 bits of the 29-bit ID

The following Figure 27-9 illustrates how the 32-bit code and mask values will be interpreted in Dual Filter Mode.

27.5.6 Error Management

The TWAI protocol requires that each TWAI node maintains the Transmit Error Count (TEC) and Receive Error Count (REC). The value of both error counts determines the current error state of the TWAI controller (i.e., Error Active, Error Passive, Bus-Off). The TWAI controller stores the TEC and REC values in the [TWAI_TX_ERR_CNT_REG](#) and [TWAI_RX_ERR_CNT_REG](#) respectively, and they can be read by the CPU anytime. In addition to the error states, the TWAI controller also offers an Error Warning Limit (EWL) feature that can warn the user of the occurrence of severe bus errors before the TWAI controller enters the Error Passive state.

The current error state of the TWAI controller is indicated via a combination of the following values and status bits: TEC, REC, [TWAI_ERR_ST](#), and [TWAI_BUS_OFF_ST](#). Certain changes to these values and bits will also trigger interrupts, thus allowing the users to be notified of error state transitions (see section 27.5.3). The following figure 27-10 shows the relation between the error states, values and bits, and error state related interrupts.

27.5.6.1 Error Warning Limit

The Error Warning Limit (EWL) feature is a configurable threshold value for the TEC and REC, which will trigger an interrupt when exceeded. The EWL is intended to serve as a warning about severe TWAI bus errors, and is triggered before the TWAI controller enters the Error Passive state. The EWL is configured in the [TWAI_ERR_WARNING_LIMIT_REG](#) and can only be configured whilst the TWAI controller is in Reset Mode. The [TWAI_ERR_WARNING_LIMIT_REG](#) has a default value of 96. When the values of TEC and/or REC are larger than

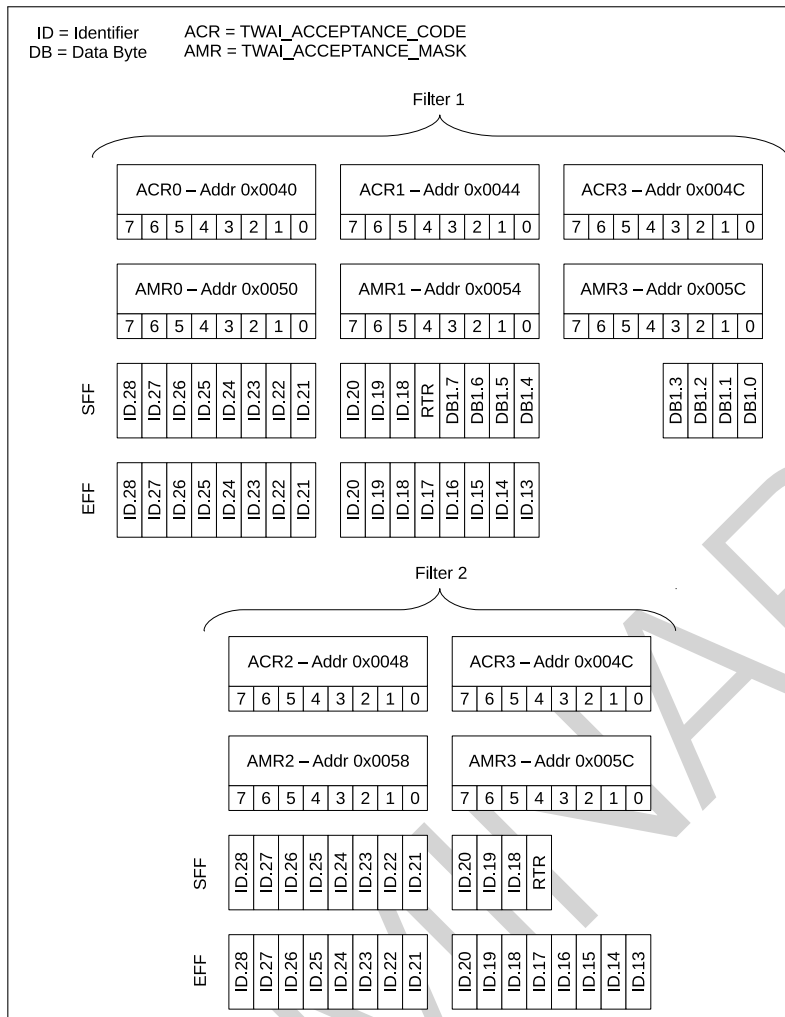

Figure 27-9. Dual Filter Mode

Figure 27-10. Error State Transition

or equal to the EWL value, the `TWAI_ERR_ST` bit is immediately set to 1. Likewise, when the values of both the TEC and REC are smaller than the EWL value, the `TWAI_ERR_ST` bit is immediately reset to 0. The Error Warning Interrupt is triggered whenever the value of the `TWAI_ERR_ST` bit (or the `TWAI_BUS_OFF_ST`) changes.

27.5.6.2 Error Passive

The TWAI controller is in the Error Passive state when the TEC or REC value exceeds 127. Likewise, when both the TEC and REC are less than or equal to 127, the TWAI controller enters the Error Active state. The Error Passive Interrupt is triggered whenever the TWAI controller transitions from the Error Active state to the Error Passive state or vice versa.

27.5.6.3 Bus-Off and Bus-Off Recovery

The TWAI controller enters the Bus-Off state when the TEC value exceeds 255. On entering the Bus-Off state, the TWAI controller will automatically do the following:

- Set REC to 0
- Set TEC to 127
- Set the `TWAI_BUS_OFF_ST` bit to 1
- Enter Reset Mode

The Error Warning Interrupt is triggered whenever the value of the `TWAI_BUS_OFF_ST` bit (or the `TWAI_ERR_ST` bit) changes.

To return to the Error Active state, the TWAI controller must undergo Bus-Off Recovery. Bus-Off Recovery requires the TWAI controller to observe 128 occurrences of 11 consecutive recessive bits on the bus. To initiate Bus-Off Recovery (after entering the Bus-Off state), the TWAI controller should enter Operation Mode by setting the `TWAI_RESET_MODE` bit to 0. The TEC tracks the progress of Bus-Off Recovery by decrementing the TEC each time when the TWAI controller observes 11 consecutive recessive bits. When Bus-Off Recovery has completed (i.e., TEC has decremented from 127 to 0), the `TWAI_BUS_OFF_ST` bit will automatically be reset to 0, thus triggering the Error Warning Interrupt.

27.5.7 Error Code Capture

The Error Code Capture (ECC) feature allows the TWAI controller to record the error type and bit position of a TWAI bus error in the form of an error code. Upon detecting a TWAI bus error, the Bus Error Interrupt is triggered and the error code is recorded in the `TWAI_ERR_CODE_CAP_REG`. Subsequent bus errors will trigger the Bus Error Interrupt, but their error codes will not be recorded until the current error code is read from the `TWAI_ERR_CODE_CAP_REG`.

The following Table 27-16 shows the fields of the `TWAI_ERR_CODE_CAP_REG`:

Table 27-16. Bit Information of `TWAI_ERR_CODE_CAP_REG` (0x30)

Bit 31-8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reserved	ERRC.1 ¹	ERRC.0 ¹	DIR ²	SEG.4 ³	SEG.3 ³	SEG.2 ³	SEG.1 ³	SEG.0 ³

Notes:

- **ERRC:** The Error Code (ERRC) indicates the type of bus error: 00 for bit error, 01 for format error, 10 for stuff error, 11 for other types of error.
- **DIR:** The Direction (DIR) indicates whether the TWAI controller was transmitting or receiving when the bus error occurred: 0 for transmitter, 1 for receiver.
- **SEG:** The Error Segment (SEG) indicates which segment of the TWAI message (i.e., bit position) the bus

error occurred at.

The following Table 27-17 shows how to interpret the SEG.0 to SEG.4 bits.

Table 27-17. Bit Information of Bits SEG.4 - SEG.0

Bit SEG.4	Bit SEG.3	Bit SEG.2	Bit SEG.1	Bit SEG.0	Description
0	0	0	1	1	start of frame
0	0	0	1	0	ID.28 ~ ID.21
0	0	1	1	0	ID.20 ~ ID.18
0	0	1	0	0	bit SRTR
0	0	1	0	1	bit IDE
0	0	1	1	1	ID.17 ~ ID.13
0	1	1	1	1	ID.12 ~ ID.5
0	1	1	1	0	ID.4 ~ ID.0
0	1	1	0	0	bit RTR
0	1	1	0	1	reserved bit 1
0	1	0	0	1	reserved bit 0
0	1	0	1	1	data length code
0	1	0	1	0	data field
0	1	0	0	0	CRC sequence
1	1	0	0	0	CRC delimiter
1	1	0	0	1	ACK slot
1	1	0	1	1	ACK delimiter
1	1	0	1	0	end of frame
1	0	0	1	0	intermission
1	0	0	0	1	active error flag
1	0	1	1	0	passive error flag
1	0	0	1	1	tolerate dominant bits
1	0	1	1	1	error delimiter
1	1	1	0	0	overload flag

Notes:

- Bit SRTR: under Standard Frame Format.
- Bit IDE: Identifier Extension Bit, 0 for Standard Frame Format.

27.5.8 Arbitration Lost Capture

The Arbitration Lost Capture (ALC) feature allows the TWAI controller to record the bit position where it loses arbitration. When the TWAI controller loses arbitration, the bit position is recorded in the TWAI_ARB LOST CAP_REG and the Arbitration Lost Interrupt is triggered.

Subsequent loses in arbitration will trigger the Arbitration Lost Interrupt, but will not be recorded in the TWAI_ARB LOST CAP_REG until the current Arbitration Lost Capture is read from the TWAI_ERR_CODE_CAP_REG.

Table 27-18 illustrates bits and fields of the TWAI_ERR_CODE_CAP_REG whilst Figure 27-11 illustrates the bit positions of a TWAI message.

Table 27-18. Bit Information of TWAI_ARB LOST CAP_REG (0x2c)

Bit 31-5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reserved	BITNO.4 ¹	BITNO.3 ¹	BITNO.2 ¹	BITNO.1 ¹	BITNO.0 ¹

Notes:

- BITNO: Bit Number (BITNO) indicates the nth bit of a TWAI message where arbitration was lost.

Figure 27-11. Positions of Arbitration Lost Bits

27.6 Register Summary

'|' here means separate line. The left describes the access in Operation Mode. The right belongs to Reset Mode. The addresses in this section are relative to the [\[Two-wire Automotive Interface\]](#) base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
Configuration Registers			
TWAI_MODE_REG	Mode Register	0x0000	R/W
TWAI_BUS_TIMING_0_REG	Bus Timing Register 0	0x0018	RO R/W

27.7 Registers

'|' here means separate line. The left describes the access in Operation Mode. The right belongs to Reset Mode with red color. The addresses in this section are relative to the Two-wire Automotive Interface base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 27.1. TWAI_MODE_REG (0x0000)

(reserved)																TWAI_RX_FILTER_MODE				TWAI_SELF_TEST_MODE				TWAI_LISTEN_ONLY_MODE				TWAI_RESET_MODE			
31													4	3	2	1	0													Reset	
0																0				0				1							

TWAI_RESET_MODE This bit is used to configure the operation mode of the TWAI Controller. 1: Reset mode; 0: Operation mode (R/W)

TWAI_LISTEN_ONLY_MODE 1: Listen only mode. In this mode the nodes will only receive messages from the bus, without generating the acknowledge signal nor updating the RX error counter. (R/W)

TWAI_SELF_TEST_MODE 1: Self test mode. In this mode the TX nodes can perform a successful transmission without receiving the acknowledge signal. This mode is often used to test a single node with the self reception request command. (R/W)

TWAI_RX_FILTER_MODE This bit is used to configure the filter mode. 0: Dual filter mode; 1: Single filter mode (R/W)

Register 27.2. TWAI_BUS_TIMING_0_REG (0x0018)

(reserved)																TWAI_SYNC_JUMP_WIDTH				TWAI_BAUD_PRESC										
31													16	15	14	13	12													Reset
0																0x0				0x00										

TWAI_BAUD_PRESC Baud Rate Prescaler value, determines the frequency dividing ratio. (RO | R/W)

TWAI_SYNC_JUMP_WIDTH Synchronization Jump Width (SJW), 1 ~ 14 Tq wide. (RO | R/W)

Register 27.5. TWAI_DATA_0_REG (0x0040)

TWAI_TX_BYTE_0 Stored the 0th byte information of the data to be transmitted in operation mode. (WO)

TWAI_ACCEPTANCE_CODE_0 Stored the 0th byte of the filter code in reset mode. (R/W)

Register 27.6. TWAI_DATA_1_REG (0x0044)

TWAI_TX_BYTE_1 Stored the 1st byte information of the data to be transmitted in operation mode. (WO)

TWAI_ACCEPTANCE_CODE_1 Stored the 1st byte of the filter code in reset mode. (R/W)

Register 27.7. TWAI_DATA_2_REG (0x0048)

TWAI_TX_BYTE_2 Stored the 2nd byte information of the data to be transmitted in operation mode. (WO)

TWAI_ACCEPTANCE_CODE_2 Stored the 2nd byte of the filter code in reset mode. (R/W)

Register 27.8. TWAI_DATA_3_REG (0x004C)

TWAI_TX_BYTE_3 Stored the 3rd byte information of the data to be transmitted in operation mode. (WO)

TWAI_ACCEPTANCE_CODE_3 Stored the 3rd byte of the filter code in reset mode. (R/W)

Register 27.9. TWAI_DATA_4_REG (0x0050)

TWAI_TX_BYTE_4 Stored the 4th byte information of the data to be transmitted in operation mode. (WO)

TWAI_ACCEPTANCE_MASK_0 Stored the 0th byte of the filter code in reset mode. (R/W)

Register 27.10. TWAI_DATA_5_REG (0x0054)

TWAI_TX_BYTE_5 Stored the 5th byte information of the data to be transmitted in operation mode. (WO)

TWAI_ACCEPTANCE_MASK_1 Stored the 1st byte of the filter code in reset mode. (R/W)

Register 27.11. TWAI_DATA_6_REG (0x0058)

TWAI_TX_BYTE_6 Stored the 6th byte information of the data to be transmitted in operation mode. (WO)

TWAI_ACCEPTANCE_MASK_2 Stored the 2nd byte of the filter code in reset mode. (R/W)

Register 27.12. TWAI_DATA_7_REG (0x005C)

TWAI_TX_BYTE_7 Stored the 7th byte information of the data to be transmitted in operation mode. (WO)

TWAI_ACCEPTANCE_MASK_3 Stored the 3rd byte of the filter code in reset mode. (R/W)

Register 27.13. TWAI_DATA_8_REG (0x0060)

TWAI_TX_BYTE_8 Stored the 8th byte information of the data to be transmitted in operation mode.
(WO)

Register 27.14. TWAI_DATA_9_REG (0x0064)

TWAI_TX_BYTE_9 Stored the 9th byte information of the data to be transmitted in operation mode.
(WO)

Register 27.15. TWAI_DATA_10_REG (0x0068)

TWAI_TX_BYTE_10 Stored the 10th byte information of the data to be transmitted in operation mode.
(WO)

Register 27.16. TWAI_DATA_11_REG (0x006C)

TWAI_TX_BYTE_11 Stored the 11th byte information of the data to be transmitted in operation mode. (WO)

Register 27.17. TWAI_DATA_12_REG (0x0070)

TWAI_TX_BYTE_12 Stored the 12th byte information of the data to be transmitted in operation mode. (WO)

Register 27.18. TWAI_CLOCK_DIVIDER_REG (0x007C)

TWAI_CD These bits are used to configure the divisor of the external CLKOUT pin. (R/W)

TWAI_CLOCK_OFF This bit can be configured in reset mode. 1: Disable the external CLKOUT pin; 0: Enable the external CLKOUT pin (RO | R/W)

Register 27.21. TWAI_ARB_LOST_CAP_REG (0x002C)

TWAI_ARB_LOST_CAP This register contains information about the bit position of lost arbitration. (RO)

Register 27.22. TWAI_ERR_CODE_CAP_REG (0x0030)

TWAI_ERR_CODE_CAP This register contains information about the location of errors, see Table 27-16 for details. (RO)

TWAI_ERR_DIRECTION This register contains information about transmission direction of the node when error occurs. 1: Error occurs when receiving a message; 0: Error occurs when transmitting a message (RO)

TWAI_ERR_TYPE This register contains information about error types: 00: bit error; 01: form error; 10: stuff error; 11: other type of error (RO)

Register 27.23. TWAI_RX_ERR_CNT_REG (0x0038)

TWAI_RX_ERR_CNT The RX error counter register, reflects value changes in reception status. (RO | R/W)

Register 27.24. TWAI_TX_ERR_CNT_REG (0x003C)

TWAI_TX_ERR_CNT The TX error counter register, reflects value changes in transmission status. (RO
I R/W)

Register 27.25. TWAI_RX_MESSAGE_CNT_REG (0x0074)

TWAI_RX_MESSAGE_COUNTER This register reflects the number of messages available within the RX FIFO. (RO)

Register 27.26. TWAI_INT_RAW_REG (0x000C)

(reserved)													TWAI_BUS_STATE_INT_ST TWAI_BUS_ERR_INT_ST TWAI_ARB_LOST_INT_ST TWAI_ERR_PASSIVE_INT_ST (reserved) TWAI_OVERRUN_INT_ST TWAI_ERR_WARN_INT_ST TWAI_TX_INT_ST TWAI_RX_INT_ST													
31													9	8	7	6	5	4	3	2	1	0	Reset			
0													0	0	0	0	0	0	0	0	0	0	0	0	0	0

TWAI_RX_INT_ST Receive interrupt. If this bit is set to 1, it indicates there are messages to be handled in the RX FIFO. (RO)

TWAI_TX_INT_ST Transmit interrupt. If this bit is set to 1, it indicates the message transmission is finished and a new transmission is able to start. (RO)

TWAI_ERR_WARN_INT_ST Error warning interrupt. If this bit is set to 1, it indicates the error status signal and the bus-off status signal of Status register have changed (e.g., switched from 0 to 1 or from 1 to 0). (RO)

TWAI_OVERRUN_INT_ST Data overrun interrupt. If this bit is set to 1, it indicates a data overrun interrupt is generated in the RX FIFO. (RO)

TWAI_ERR_PASSIVE_INT_ST Error passive interrupt. If this bit is set to 1, it indicates the TWAI Controller is switched between error active status and error passive status due to the change of error counters. (RO)

TWAI_ARB_LOST_INT_ST Arbitration lost interrupt. If this bit is set to 1, it indicates an arbitration lost interrupt is generated. (RO)

TWAI_BUS_ERR_INT_ST Error interrupt. If this bit is set to 1, it indicates an error is detected on the bus. (RO)

TWAI_BUS_STATE_INT_ST Bus state interrupt. If this bit is set to 1, it indicates the status of TWAI controller has changed. (RO)

Register 27.27. TWAI_INT_ENA_REG (0x0010)

(reserved)										TWAI_BUS_STATE_INT_ENA TWAI_BUS_ERR_INT_ENA TWAI_ARB_LOST_INT_ENA TWAI_ERR_PASSIVE_INT_ENA (reserved) TWAI_OVERRUN_INT_ENA TWAI_ERR_WARN_INT_ENA TWAI_TX_INT_ENA TWAI_RX_INT_ENA											
31										9	8	7	6	5	4	3	2	1	0		
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Reset

- TWAI_RX_INT_ENA** Set this bit to 1 to enable receive interrupt. (R/W)
- TWAI_TX_INT_ENA** Set this bit to 1 to enable transmit interrupt. (R/W)
- TWAI_ERR_WARN_INT_ENA** Set this bit to 1 to enable error warning interrupt. (R/W)
- TWAI_OVERRUN_INT_ENA** Set this bit to 1 to enable data overrun interrupt. (R/W)
- TWAI_ERR_PASSIVE_INT_ENA** Set this bit to 1 to enable error passive interrupt. (R/W)
- TWAI_ARB_LOST_INT_ENA** Set this bit to 1 to enable arbitration lost interrupt. (R/W)
- TWAI_BUS_ERR_INT_ENA** Set this bit to 1 to enable bus error interrupt. (R/W)
- TWAI_BUS_STATE_INT_ENA** Set this bit to 1 to enable bus state interrupt. (R/W)

28 USB On-The-Go (USB)

28.1 Overview

The ESP32-S3 features a USB On-The-Go peripheral (henceforth referred to as OTG_FS) along with an integrated transceiver. The OTG_FS can operate as either a USB Host or Device and supports 12 Mbit/s full-speed (FS) and 1.5 Mbit/s low-speed (LS) data rates of the USB 2.0 specification. The Host Negotiation Protocol (HNP) and the Session Request Protocol (SRP) are also supported.

28.2 Features

28.2.1 General Features

- FS and LS data rates
- HNP and SRP as A-device or B-device
- Dynamic FIFO (DFIFO) sizing
- Multiple modes of memory access
 - Scatter/Gather DMA mode
 - Buffer DMA mode
 - Slave mode
- Can choose integrated transceiver or external transceiver
- Utilizing integrated transceiver with USB Serial/JTAG by time-division multiplexing when only integrated transceiver is used
- Support USB OTG using one of the transceivers while USB Serial/JTAG using the other one when both integrated transceiver or external transceiver are used

28.2.2 Device Mode Features

- Endpoint number 0 always present (bi-directional, consisting of EP0 IN and EP0 OUT)
- Six additional endpoints (endpoint numbers 1 to 6), configurable as IN or OUT
- Maximum of five IN endpoints concurrently active at any time (including EP0 IN)
- All OUT endpoints share a single RX FIFO
- Each IN endpoint has a dedicated TX FIFO

28.2.3 Host Mode Features

- Eight channels (pipes)
 - A control pipe consists of two channels (IN and OUT), as IN and OUT transactions must be handled separately. Only Control transfer type is supported.
 - Each of the other seven channels is dynamically configurable to be IN or OUT, and supports Bulk, Isochronous, and Interrupt transfer types.

- All channels share an RX FIFO, non-periodic TX FIFO, and periodic TX FIFO. The size of each FIFO is configurable.

28.3 Functional Description

28.3.1 Controller Core and Interfaces

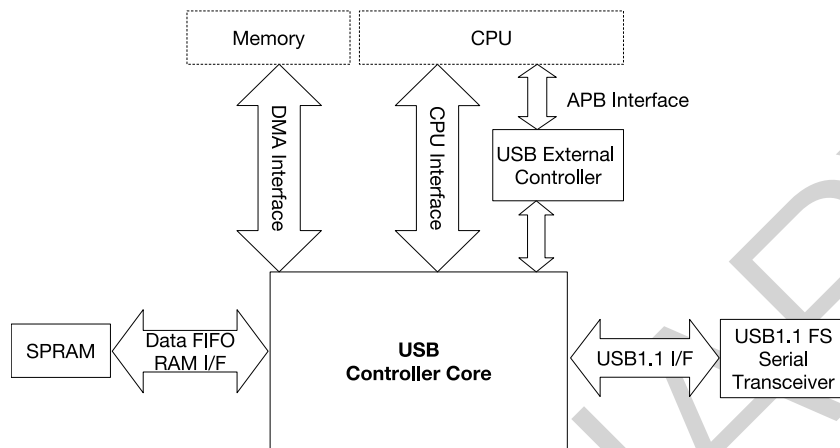

Figure 28-1. OTG_FS System Architecture

The core part of the OTG_FS peripheral is the USB Controller Core. The controller core has the following interfaces (see Figure 28-1):

- **CPU Interface**
Provides the CPU with read/write access to the controller core's various registers and FIFOs. This interface is internally implemented as an AHB Slave Interface. The way to access the FIFOs through the CPU interface is called Slave mode.
- **APB Interface**
Allows the CPU to control the USB controller core via the USB external controller.
- **DMA Interface**
Provides the controller core's internal DMA with read/write access to system memory (e.g., fetching and writing data payloads when operating in DMA mode). This interface is internally implemented as an AHB Master interface.
- **USB 2.0 Interface**
This interface is used to connect the controller core to a USB 2.0 FS serial transceiver. Aside from USB OTG, ESP32-S3 also includes a USB Serial/JTAG controller (see Chapter 29 [USB Serial/JTAG Controller \(USB_SERIAL_JTAG\)](#)). These two USB controllers can utilize the integrated internal transceiver by time-division multiplexing or one USB controller connects to internal transceiver and the other one connects to an external transceiver.

When only internal transceiver is used, it is shared by USB OTG and USB Serial/JTAG. In default, internal transceiver is connected to USB Serial/JTAG. When `RTC_CNTL_SW_HW_USB_PHY_SEL_CFG` is 0, the connection of internal transceiver is controlled by efuse bit `EFUSE_USB_PHY_SEL`. When `EFUSE_USB_PHY_SEL` is 0, internal transceiver is connected with USB Serial/JTAG. Otherwise, it is connected to USB OTG. When `RTC_CNTL_SW_HW_USB_PHY_SEL_CFG` is 1, the connection switching is controlled by `RTC_CNTL_SW_USB_PHY_SEL_CFG`(it has the same meaning with

EFUSE_USB_PHY_SEL).

When both internal transceiver and external transceiver are used, one USB controller select one of transceivers, the other would select the other transceiver. The specific connection mapping please refer to Chapter 29 *USB Serial/JTAG Controller (USB_SERIAL_JTAG)*.

- **USB External Controller**

The USB External Controller is primarily used to control the routing of the USB 2.0 FS serial interface to either the internal or external transceiver. The External Controller can also enable a power saving mode by gating the controller core's clock (AHB clock) or powering down the connected SPRAM. Note that this power saving mode is different for the power savings via SRP.

- **Data FIFO RAM Interface**

The multiple FIFOs used by the controller core are not actually located within the controller core itself, but on the SPRAM (Single-Port RAM). FIFOs are dynamically sized, thus are allocated at run-time in the SPRAM. When the CPU, DMA, or the controller core attempts to read/write to FIFOs, those accesses are routed through the data FIFO RAM interface.

28.3.2 Memory Layout

The following diagram illustrates the memory layout of the OTG_FS registers which are used to configure and control the USB Controller Core. Note that USB External Controller uses a separate set of registers (called wrap registers).

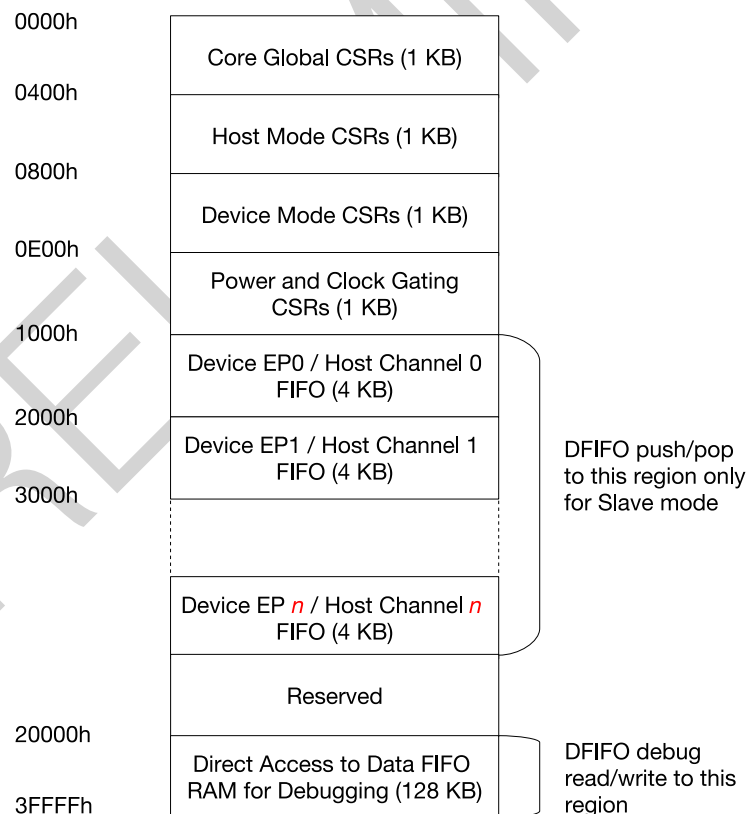

Figure 28-2. OTG_FS Register Layout

28.3.2.1 Control & Status Registers

- **Global CSRs**

These registers are responsible for the configuration/control/status of the global features of OTG_FS (i.e., features which are common to both Host and Device modes). These features include OTG control (HNP, SRP, and A/B-device detection), USB configuration (selecting Host or Device mode and PHY selection), and system-level interrupts. Software can access these registers whilst in Host or Device modes.

- **Host Mode CSRs**

These registers are responsible for the configuration/control/status when operating in Host mode, thus should only be accessed when operating in Host mode. Each channel will have its own set of registers within the Host mode CSRs.

- **Device Mode CSRs**

These registers are responsible for the configuration/control/status when operating in Device mode, thus should only be accessed when operating in Device mode. Each Endpoint will have its own set of registers within the Device mode CSRs.

- **Power and Clock Gating**

A single register used to control power-down and gate various clocks.

28.3.2.2 FIFO Access

The OTG_FS makes use of multiple FIFOs to buffer transmitted or received data payloads. The number and type of FIFOs are dependent on Host or Device mode, and the number of channels or endpoints used (see Section 28.3.3). There are two ways to access the FIFOs: DMA mode and Slave mode. When using Slave mode, the CPU will need to access these FIFOs by reading and writing to either the DFIFO push/pop regions or the DFIFO read/write debug region. FIFO access is governed by the following rules:

- Read access to any address in any one of the 4 KB push/pop regions will result in a pop from the shared RX FIFO.
- Write access to a particular 4 KB push/pop region will result in a push to the corresponding endpoint or channel's TX FIFO given that the endpoint is an IN endpoint, or the channel is an OUT channel.
 - In Device mode, data is pushed to the corresponding IN endpoint's dedicated TX FIFO.
 - In Host mode, data is pushed to the non-periodic TX FIFO or the periodic TX FIFO depending on whether the channel is a non-periodic channel, or a periodic channel.
- Access to the 128 KB read/write region will result in direct read/write instead of a push/pop. This is generally used for debugging purposes only.

Note that pushing and popping data to and from the FIFOs by the CPU is only required when operating in Slave mode. When operating in DMA mode, the internal DMA will handle all pushing/popping of data to and from the TX and RX FIFOs.

28.3.3 FIFO and Queue Organization

The FIFOs in OTG_FS are primarily used to hold data packet payloads (the data field of USB Data packets). TX FIFOs are used to store data payloads that will be transmitted by OUT transactions in Host mode or IN transactions in Device mode. RX FIFOs are used to store received data payloads of IN transactions in Host mode

or OUT transactions in Device mode. In addition to storing data payloads, RX FIFOs also store a **status entry** for each data payload. Each status entry contains information about a data payload such as channel number, byte count, and validity status. When operating in slave mode, status entries are also used to indicate various channel events.

The portion of SPRAM that can be used for FIFO allocation has a depth of 256 and a width of 35 bits (32 data bits plus 3 control bits). The multiple FIFOs used by each channel (in Host mode) or endpoint (in Device mode) are allocated into the SPRAM and can be dynamically sized.

28.3.3.1 Host Mode FIFOs and Queues

The following FIFOs are used when operating in Host mode (see Figure 28-3):

- **Non-periodic TX FIFO:** Stores data payloads of bulk and control OUT transactions for all channels.
- **Periodic TX FIFO:** Stores data payloads of interrupt or isochronous OUT transactions for all channels.
- **RX FIFO:** Stores data payloads of all IN transactions, and status entries that are used to indicate size of data payloads and transaction/channel events such as transfer complete or channel halted.

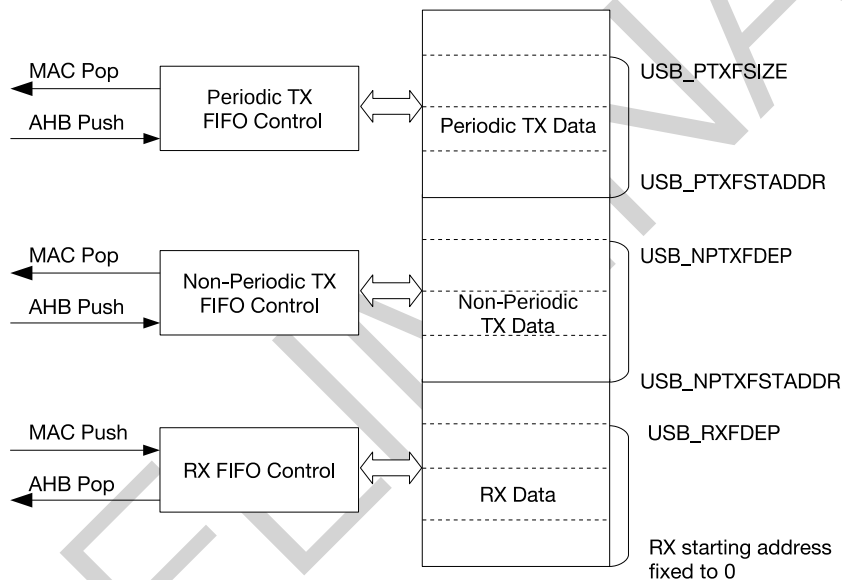

Figure 28-3. Host Mode FIFOs

In addition to FIFOs, Host mode also contains two request queues used to queue up the various transaction request from the multiple channels. Each entry in a request queue holds the IN/OUT channel number along with other information to perform the transaction (such as transaction type). Request queues are also used to queue other types of requests such as a channel halt request.

Unlike FIFOs, request queues are fixed in size and cannot be accessed directly by software. Rather, once a channel is enabled, requests will be automatically written to the request queue by the Host core. The order in which the requests are written into the queue determines the sequence of transactions on the USB.

Host mode contains the following request queues:

- **Non-periodic request queue:** Request queue for all non-periodic channels (bulk and control). The queue has a depth of four entries.

- **Periodic request queue:** Request queue for all periodic channels (interrupt and isochronous). The queue has a depth of eight entries.

When scheduling transactions, hardware will execute all requests on the periodic request queue first before executing requests on the non-periodic request queue.

28.3.3.2 Device Mode FIFOs

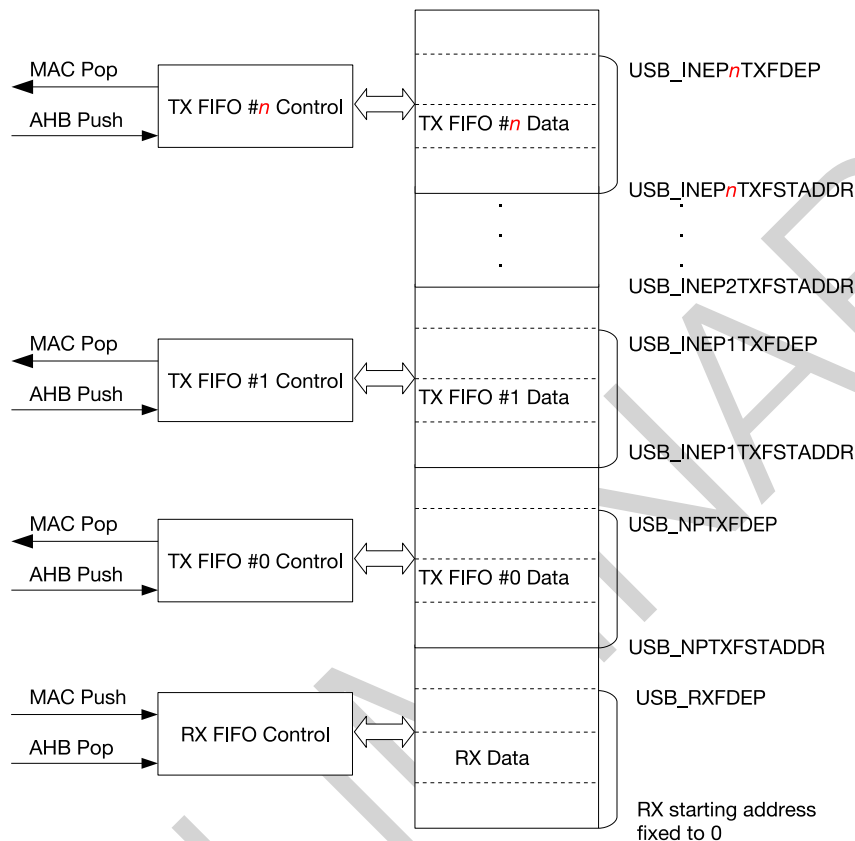

Figure 28-4. Device Mode FIFOs

The following FIFOs are used when operating in Device mode (See Figure 28-4):

- **RX FIFO:** Stores data payloads received in Data packet, and status entries (used to indicate size of those data payloads).
- **Dedicated TX FIFO:** Each active IN endpoint will have a dedicated TX FIFO used to store all IN data payloads of that endpoint, regardless of the transaction type (both periodic and non-periodic IN transactions).

Due to the dedicated FIFOs, Device mode does not use any request queues. Instead, the order of IN transactions are determined by the Host.

28.3.4 Interrupt Hierarchy

OTG_FS provides a single interrupt line which can be routed via the interrupt matrix to one of the CPUs. The interrupt signal can be unmasked by setting USB_GLBLINTRMSK. The OTG_FS interrupt is an OR of all bits in the USB_GINTSTS_REG register, and the bits in USB_GINTSTS_REG can be unmasked by setting the corresponding bits in the USB_GINTMSK_REG register. USB_GINTSTS_REG contains system level interrupts,

and also specific bits for Host or Device mode interrupts, and OTG specific interrupts. OTG_FS interrupt sources are organized as Figure 28-5 shows.

The following bits of the USB_GINTSTS_REG register indicate an interrupt source lower in the hierarchy:

- **USB_PRTINT** indicates that the Host port has a pending interrupt. The USB_HPRT_REG register indicates the interrupt source.
- **USB_HCHINT** indicates that one or more Host channels have a pending interrupt. Read the USB_HAINT_REG register to determine which channel(s) have a pending interrupt, then read the pending channel's USB_HCINT_{*n*}_REG register to determine the interrupt source.
- **USB_OEPINT** indicates that one or more OUT endpoints have a pending interrupt. Read the USB_DAINTEP_REG register to determine which OUT endpoint(s) have a pending interrupt, then read the USB_DOEPINT_{*n*}_REG register to determine the interrupt source.
- **USB_IEPINT** indicates that one or more IN endpoints have a pending interrupt. Read the USB_DAINTEP_REG register to determine which IN endpoint(s) are pending, then read the pending IN endpoint's USB_DIEPINT_{*n*}_REG register to determine the interrupt source.
- **USB_OTGINT** indicates an On-The-Go event has triggered an interrupt. Read the USB_GOTGINT_REG register to determine which OTG event(s) triggered the interrupt.

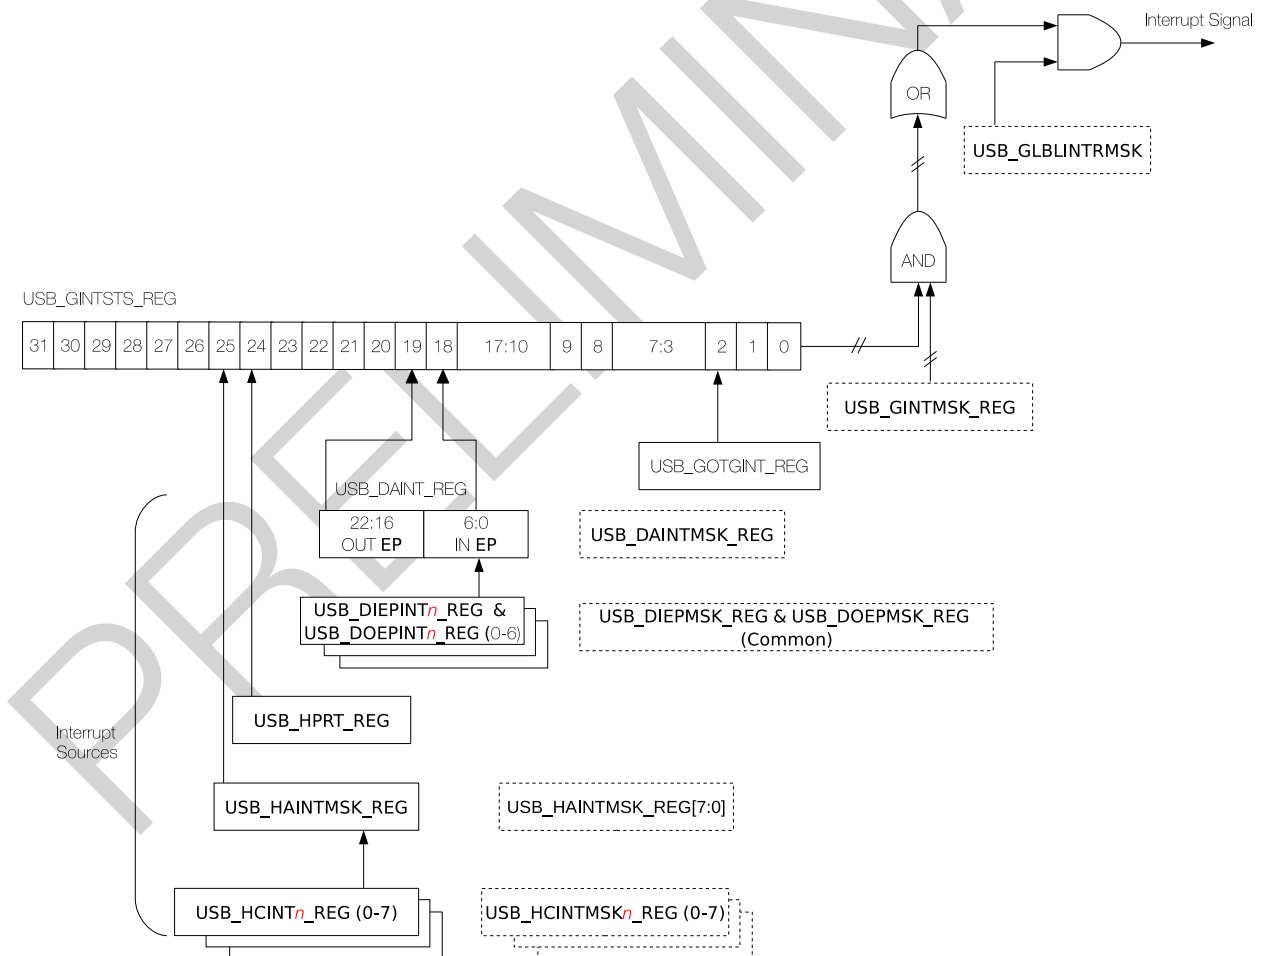

Figure 28-5. OTG_FS Interrupt Hierarchy

28.3.5 DMA Modes and Slave Mode

USB On-The-Go supports three ways to access memory: Scatter/Gather DMA mode, Buffer DMA mode, and Slave mode.

28.3.5.1 Slave Mode

When operating in Slave mode, all data payloads must be pushed/popped to and from the FIFOs by the CPU.

- When transmitting a packet using IN endpoints or OUT channels, the data payload must be pushed into the corresponding endpoint or channel's TX FIFO.
- When receiving a packet, the packet's status entry must first be popped off the RX FIFO by reading USB_GRXSTSP_REG. The status entry should be used to determine the length of the packet's payload (in bytes). The corresponding number of bytes must then be manually popped off the RX FIFO by reading from the RX FIFO's memory region.

28.3.5.2 Buffer DMA Mode

Buffer mode is similar to Slave mode but utilizes the internal DMA to push and pop data payloads to the FIFOs.

- When transmitting a packet using IN endpoints or OUT channels, the data payload's address in memory should be written to the USB_HCDMA n _REG (in Host mode) or USB_DOEPDMA n _REG (in Device mode) registers. When the endpoint or channel is enabled, the internal DMA will push the data payload from memory into the TX FIFO of the channel or endpoint.
- When receiving a packet using OUT endpoints or IN channels, the address of an empty buffer in memory should be written to the USB_HCDMA n _REG (in Host mode) or USB_DOEPDMA n _REG (in Device mode) registers. When the endpoint or channel is enabled, the internal DMA will pop the data payload from RX FIFO into the buffer.

28.3.5.3 Scatter/Gather DMA Mode

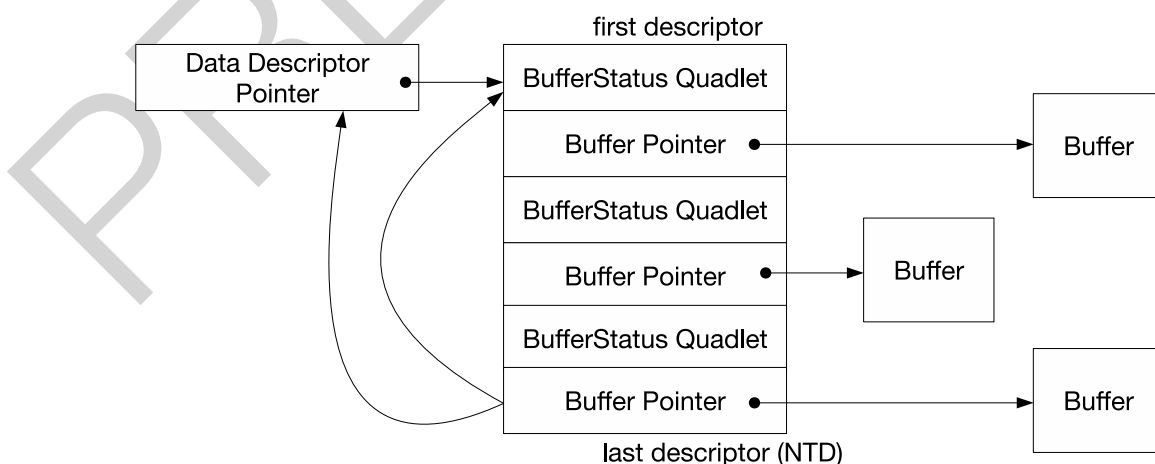

Figure 28-6. Scatter/Gather DMA Descriptor List

When operating in Scatter/Gather DMA mode, buffers containing data payloads can be scattered throughout memory. Each endpoint or channel will have a contiguous DMA descriptor list, where each descriptor contains a 32-bit pointer to the data payload or buffer and a 32-bit buffer descriptor (BufferStatus Quadlet). The data payloads and buffers can correspond to a single transaction (i.e., < 1 MPS bytes) or an entire transfer (> 1 MPS bytes). (MPS: maximum packet size) The list is implemented as a ring buffer meaning that the DMA will return to the first entry when it encounters the last entry on the list.

- When transmitting a transfer/transaction using IN endpoints or OUT channels, the DMA will gather the data payloads from the multiple buffers and push them into a TX FIFO.
- When receiving a transfer/transaction using OUT endpoints or IN channels, the DMA will pop the received data payloads from the RX FIFO and scatter them to the multiple buffers pointed to by the DMA list entries.

28.3.6 Transaction and Transfer Level Operation

When operating in either Host or Device mode, communication can operate either at the transaction level or the transfer level.

28.3.6.1 Transaction and Transfer Level in DMA Mode

When operating at the transfer level in DMA Host mode, software is interrupted only when a channel has been halted. Channels are halted when their programmed transfer size has completed successfully, has received a STALL, or if there are excessive transaction errors (i.e., 3 consecutive transaction errors). When operating in DMA Device mode, all errors are handled by the controller core itself.

When operating at the transaction level in DMA mode, the transfer size is set to the size of one data packet (either a maximum packet size or a short packet size).

28.3.6.2 Transaction and Transfer Level in Slave Mode

When operating at the transaction level in Slave Mode, transfers are handled one transaction at a time. Each data payload should correspond to a single data packet, and software must determine whether a retry of the transaction is necessary based on the handshake response received on the USB (e.g., ACK or NAK).

The following table describes transaction level operation in Slave mode for both IN and OUT transactions.

Table 28-1. IN and OUT Transactions in Slave Mode

Host Mode	Device Mode
OUT Transactions	
<ol style="list-style-type: none"> 1. Software specifies the size of the data packet and the number of data packets (1 data packet) in the USB_HCTSIZ_n_REG register, enables the channel, then copies the packet's data payload into the TX FIFO. 2. When the last DWORD of the data payload has been pushed, the controller core will automatically write a request into the appropriate request queue. 3. If the transaction was successful, the USB_XFERCOMPL interrupt will be generated. If the transaction was unsuccessful, an error interrupt (e.g. USB_H_NACK_n) will occur. 	<ol style="list-style-type: none"> 1. Software specifies the expected size of the data packet (1 MPS) and the number of data packets (1 data packet) in the USB_DIEPTSIZ_n_REG register. Once the endpoint is enabled, it will wait for the host to transmit a packet to it. 2. The received packet will be pushed into the RX FIFO along with a packet status entry. 3. If the transaction was unsuccessful (e.g., due to a full RX FIFO), the endpoint will automatically NAK the incoming packet.
IN Transactions	
<ol style="list-style-type: none"> 1. Software specifies the expected size of the data packet and the number of packets (1 data packet) in the USB_HCTSIZ_n_REG register, then enables the channel. 2. The controller core will automatically write a request into the appropriate request queue. 3. If the transaction was successful, the received data along with a status entry should be written to the RX FIFO. If the transaction was unsuccessful, an error interrupt (e.g., USB_H_NACK_n) will occur. 	<ol style="list-style-type: none"> 1. Software specifies the size of the data packet and the number of data packets (1 data packet) in the USB_DIEPTSIZ_n_REG register. Once the endpoint is enabled, it will wait for the host to read the packet. 2. When the packet has been transmitted, the USB_XFERCOMPL interrupt will be generated.

When operating at the transfer level in Slave mode, one or more transaction-level operations can be pipelined thus being analogous to transfer level operation in DMA mode. Within pipelined transactions, multiple packets of the same transfer can be read/written from the FIFOs in single instance, thus preventing the need for interrupting the software on a per-packet basis.

Operating on a transfer level in Slave mode is similar to operating on the transaction-level, except the transfer size and packet count for each transfer in the USB_HCTSIZ_n_REG or USB_DIEPTSIZ_n_REG register will need to be set to reflect the entire transfer. After the channel or endpoint is enabled, multiple data packets worth of payloads should be written to or read from the TX or RX FIFOs respectively (given that there is enough space or enough data).

28.4 OTG

USB OTG allows OTG devices to act in the USB Host role or the USB Device role. Thus, OTG devices will typically have a Mini-AB or Micro-AB receptacle so that it can receive an A-plug or B-plug. OTG devices will become either an A-device or a B-device depending on whether an A-plug or a B-plug is connected.

- A-device defaults to the Host role (A-Host) whilst B-device defaults to the Device role (B-Peripheral).
- A-device and B-device may exchange roles by using the Host Negotiation Protocol (HNP), thus becoming A-peripheral and B-Host.
- A-device can turn off Vbus to save power. B-device can then wake up the A-device by requesting it to turn on Vbus and start a new session. This mechanism is called session request protocol (SRP).
- A-device always powers Vbus even if it is an A-peripheral.

OTG devices are able to determine whether they are connected to an A plug or a B plug using the ID pin of the plugs. The ID pin in A-plugs are pulled to ground whilst B-plugs have the ID pin left floating.

28.4.1 OTG Interface

The OTG_FS supports both the Session Request Protocol (SRP) and Host Negotiation Protocol (HNP) of the OTG Revision 1.3 specification. The OTG_FS controller core interfaces with the transceiver (internal or external) using the UTMI+ OTG interface. The UTMI+ OTG interface allows the controller core to manipulate the transceiver for OTG purposes (e.g., enabling/disabling pull-ups and pull-downs in HNP), and also allows the transceiver to indicate OTG related events. If an external transceiver is used instead, the UTMI+ OTG interface signals will be routed to the ESP32-S3's GPIOs instead through GPIO Matrix, please refer to Chapter [5 IO MUX and GPIO Matrix \(GPIO, IO MUX\)](#). The UTMI+ OTG interface signals are described in Table 28-2.

Table 28-2. UTMI OTG Interface

Signal Name	I/O	Description
usb_otg_iddig_in	I	Mini A/B Plug Indicator. Indicates whether the connected plug is mini-A or mini-B. Valid only when usb_otg_idpullup is sampled asserted. 1'b0: Mini-A connected 1'b1: Mini-B connected
usb_otg_avalid_in	I	A-Peripheral Session Valid. Indicates if the voltage Vbus is at a valid level for an A-peripheral session. The comparator thresholds are: 1'b0: Vbus < 0.8 V 1'b1: Vbus = 0.2 V to 2.0 V
usb_otg_bvalid_in	I	B-Peripheral Session Valid. Indicates if the voltage Vbus is at a valid level for a B-peripheral session. The comparator thresholds are: 1'b0: Vbus < 0.8 V 1'b1: Vbus = 0.8 V to 4 V
usb_otg_vbusvalid_in	I	Vbus Valid. Indicates if the voltage Vbus is valid for A/B-device/peripheral operation. The comparator thresholds are: 1'b0: Vbus < 4.4 V 1'b1: Vbus > 4.75 V

Signal Name	I/O	Description
usb_srp_sessend_in	I	B-device Session End. Indicates if the voltage Vbus is below the B-device Session End threshold. The comparator thresholds are: 1'b0: Vbus >0.8 V 1'b1: Vbus <0.2 V
usb_otg_idpullup	O	Analog ID input Sample Enable. Enables sampling the analog ID line. 1'b0: ID pin sampling disabled 1'b1: ID pin sampling enabled
usb_otg_dppulldown	O	D+ Pull-down Resistor Enable. Enables the 15 kΩ pull-down resistor on the D+ line.
usb_otg_dmpulldown	O	D- Pull-down Resistor Enable. Enables the 15 kΩ pull-down resistor on the D- line.
usb_otg_drvvbus	O	Drive Vbus. Enables driving Vbus to 5 V. 1'b0: Do not drive Vbus 1'b1: Drive Vbus
usb_srp_chrgvbus	O	Vbus Input Charge Enable. Directs the PHY to charge Vbus. 1'b0: Do not charge Vbus through a resistor 1'b1: Charge Vbus through a resistor (must be active for at least 30 ms)
usb_srp_dischrgvbus	O	Vbus Input Discharge Enable. Directs the PHY to discharge Vbus. 1'b0: Do not discharge Vbus through a resistor. 1'b1: Discharge Vbus through a resistor (must be active for at least 50 ms).

28.4.2 ID Pin Detection

Bit USB_CONIDSTS in register USB_GOTGCTL_REG indicates whether the OTG controller is an A-device (1'b0) or a B-device (1'b1). The USB_CONIDSTSCHNG interrupt will trigger whenever there is a change to USB_CONIDSTS (i.e., when a plug is connected or disconnected).

28.4.3 Session Request Protocol (SRP)

28.4.3.1 A-Device SRP

Figure 28-7 illustrates the flow of SRP when the OTG_FS is acting as an A-device (i.e., default host and the device that powers Vbus).

1. To save power, the application suspends and turns off port power when the bus is idle by writing to the Port Suspend (USB_PRTSUSP to 1'b0) and Port Power (USB_P RTPWR to 1'b0) bits in the Host Port Control and Status register.
2. PHY indicates port power off by deasserting the usb_otg_vbusvalid_in signal.
3. The A-device must detect SE0 for at least 2 ms to start SRP when Vbus power is off.
4. To initiate SRP, the B-device turns on its data line pull-up resistor for 5 to 10 ms. The OTG_FS core detects data-line pulsing.
5. The device drives Vbus above the A-device session valid (2.0 V minimum) for Vbus pulsing. The OTG_FS core interrupts the application on detecting SRP. The Session Request Detected bit (USB_SESSREQINT) is set in Global Interrupt Status register.

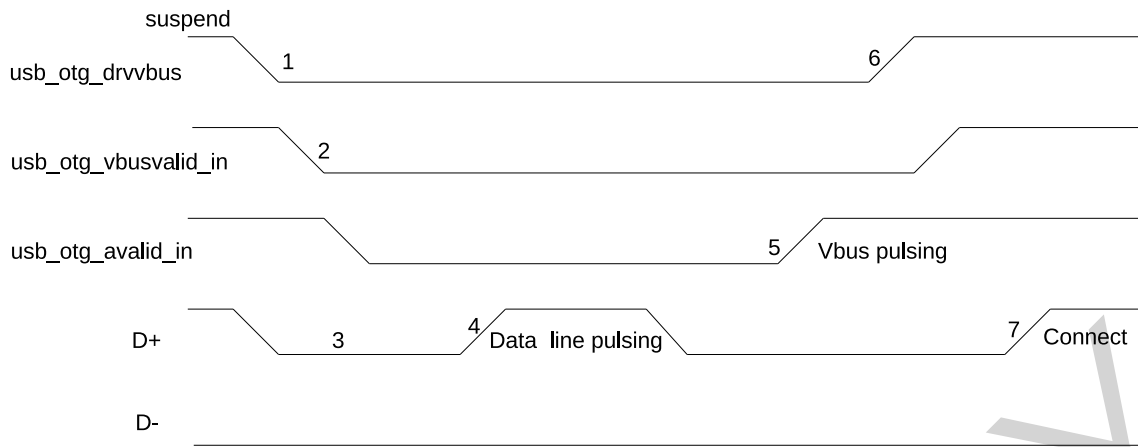

Figure 28-7. A-Device SRP

6. The application must service the Session Request Detected interrupt and turn on the Port Power bit by writing the Port Power bit in the Host Port Control and Status register. The PHY indicates port power-on by asserting `usb_otg_vbusvalid_in` signal.
7. When the USB is powered, the B-device connects, completing the SRP process.

28.4.3.2 B-Device SRP

Figure 28-8 illustrates the flow of SRP when the OTG_FS is acting as a B-device (i.e., does not power Vbus).

Figure 28-8. B-Device SRP

1. To save power, the host (A-device) suspends and turns off port power when the bus is idle. PHY indicates port power off by deasserting the `usb_otg_vbusvalid_in` signal. The OTG_FS core sets the Early Suspend bit in the Core Interrupt register (USB_ERLYSUSP interrupt) after detecting 3 ms of bus idleness. Following this, the OTG_FS core sets the USB Suspend bit (USB_USBSUSP) in the Core Interrupt register. The PHY

indicates the end of the B-device session by deasserting the `usb_otg_bvalid_in` signal.

- The OTG_FS core asserts the `usb_otg_dischrgvbus` signal to indicate to the PHY to speed up Vbus discharge.
- The PHY indicates the session's end by asserting the `usb_otg_sessend_in` signal. This is the initial condition for SRP. The OTG_FS core requires 2 ms of SE0 before initiating SRP. For a USB 2.0 full-speed serial transceiver, the application must wait until Vbus discharges to 0.2 V after `USB_BSESVLD` is deasserted.
- The application waits for 1.5 seconds (`TB_SE0_SRP` time) before initiating SRP by writing the Session Request bit (`USB_SESREQ`) in the OTG Control and Status register. The OTG_FS core performs data-line pulsing followed by Vbus pulsing.
- The host (A-device) detects SRP from either the data-line or Vbus pulsing, and turns on Vbus. The PHY indicates Vbus power-on by asserting `usb_otg_vbusvalid_in`.
- The OTG_FS core performs Vbus pulsing by asserting `usb_srp_chrgvbus`. The host (A-device) starts a new session by turning on Vbus, indicating SRP success. The OTG_FS core interrupts the application by setting the Session Request Success Status Change bit (`USB_SESREQSC`) in the OTG Interrupt Status register. The application reads the Session Request Success bit in the OTG Control and Status register.
- When the USB is powered, the OTG_FS core connects, completing the SRP process.

28.4.4 Host Negotiation Protocol (HNP)

28.4.4.1 A-Device HNP

Figure 28-9 illustrates the flow of HNP when the OTG_FS is acting as an A-device.

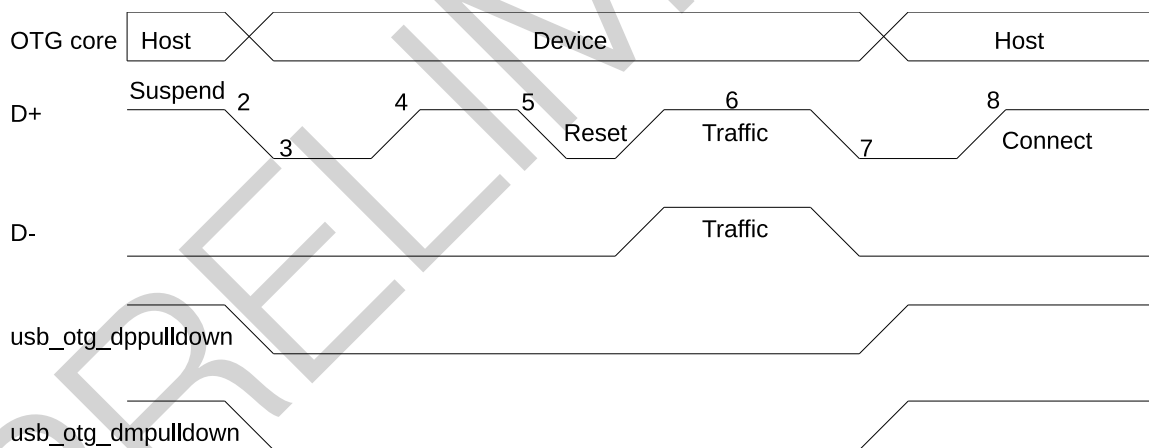

Figure 28-9. A-Device HNP

- The OTG_FS core sends the B-device a SetFeature `b_hnp_enable` descriptor to enable HNP support. The B-device's ACK response indicates that the B-device supports HNP. The application must set Host Set HNP Enable bit (`USB_HSTSETHNPEN`) in the OTG Control and Status register to indicate to the OTG_FS core that the B-device supports HNP.
- When it has finished using the bus, the application suspends by writing the Port Suspend bit (`USB_PRTSUSP`) in the Host Port Control and Status register.
- When the B-device observes a USB suspend, it disconnects, indicating the initial condition for HNP. The B-device initiates HNP only when it must switch to the host role; otherwise, the bus continues to be

suspended. The OTG_FS core sets the Host Negotiation Detected interrupt (USB_HSTNEGDET) in the OTG Interrupt Status register, indicating the start of HNP. The OTG_FS core deasserts the `usb_otg_dppulldown` and `usb_otg_dmpulldown` signals to indicate a device role. The PHY enables the D+ pull-up resistor, thus indicates a connection for the B-device. The application must read the Current Mode bit (USB_CURMOD_INT) in the OTG Control and Status register to determine Device mode operation.

4. The B-device detects the connection, issues a USB reset, and enumerates the OTG_FS core for data traffic.
5. The B-device continues the host role, initiating traffic, and suspends the bus when done. The OTG_FS core sets the Early Suspend bit (USB_ERLYSUSP) in the Core Interrupt register after detecting 3 ms of bus idleness. Following this, the OTG_FS core sets the USB Suspend bit (USB_USBSUSP) in the Core Interrupt register.
6. In Negotiated mode, the OTG_FS core detects the suspend, disconnects, and switches back to the host role. The OTG_FS core asserts the `usb_otg_dppulldown` and `usb_otg_dmpulldown` signals to indicate its assumption of the host role.
7. The OTG_FS core sets the Connector ID Status Change interrupt (USB_CONIDSTS) in the OTG Interrupt Status register. The application must read the connector ID status in the OTG Control and Status register to determine the OTG_FS core's operation as an A-device. This indicates the completion of HNP to the application. The application must read the Current Mode bit in the OTG Control and Status register to determine Host mode operation.
8. The B-device connects, completing the HNP process.

28.4.4.2 B-Device HNP

Figure 28-10 illustrates the flow of HNP when the OTG_FS is acting as an B-device.

Figure 28-10. B-Device HNP

1. The A-device sends the SetFeature `b_hnp_enable` descriptor to enable HNP support. The OTG_FS core's ACK response indicates that it supports HNP. The application must set the Device HNP Enable bit (USB_DEVHNPEN) in the OTG Control and Status register to indicate HNP support. The application sets the HNP Request bit (USB_DEVHNPEN) in the OTG Control and Status register to indicate to the OTG_FS core to initiate HNP.
2. When A-device has finished using the bus, it suspends the bus.

- (a) The OTG_FS core sets the Early Suspend bit (USB_ERLYSUSP) in the Core Interrupt register after 3 ms of bus idleness. Following this, the OTG_FS core sets the USB Suspend bit (USB_USBSUSP) in the Core Interrupt register. The OTG_FS core disconnects and the A-device detects SE0 on the bus, indicating HNP.
 - (b) The OTG_FS core asserts the `usb_otg_dppulldown` and `usb_otg_dmpulldown` signals to indicate its assumption of the host role.
 - (c) The A-device responds by activating its D+ pull-up resistor within 3 ms of detecting SE0. The OTG_FS core detects this as a connect.
 - (d) The OTG_FS core sets the Host Negotiation Success Status Change interrupt in the OTG Interrupt Status register (USB_CONIDSTS), indicating the HNP status. The application must read the Host Negotiation Success bit (USB_HSTNEGSCS) in the OTG Control and Status register to determine host negotiation success. The application must read the Current Mode bit (USB_CURMOD_INT) in the Core Interrupt register to determine Host mode operation.
3. Program the USB_PRTTPWR bit to 1'b1. This drives Vbus on the USB.
 4. Wait for the USB_PRTCONDET interrupt. This indicates that a device is connected to the port.
 5. The application sets the reset bit (USB_PRRST) and the OTG_FS core issues a USB reset and enumerates the A-device for data traffic.
 6. Wait for the USB_PRTENCHNG interrupt.
 7. The OTG_FS core continues the host role of initiating traffic, and when done, suspends the bus by writing the Port Suspend bit (USB_PRTSUSP) in the Host Port Control and Status register.
 8. In Negotiated mode, when the A-device detects a suspend, it disconnects and switches back to the host role. The OTG_FS core deasserts the `usb_otg_dppulldown` and `usb_otg_dmpulldown` signals to indicate the assumption of the device role.
 9. The application must read the Current Mode bit (USB_CURMOD_INT) in the Core Interrupt register to determine the Host mode operation.
 10. The OTG_FS core connects, completing the HNP process.

29 USB Serial/JTAG Controller (USB_SERIAL_JTAG)

The ESP32-S3 contains an USB Serial/JTAG Controller. This unit can be used to program the SoC's flash, read program output, as well as attach a debugger to the running program. All of these are possible for any computer with a USB host ('host' in the rest of this text) without any active external components.

29.1 Overview

The workflow of developing on previous versions of Espressif chips generally use two methods of communication with the SoC: one is a serial port and the other is the JTAG debugging port. The serial port is a two-wire interface traditionally used to push new firmware-under-development to the chip ('programming'). As most modern computers do not have a compatible serial port anymore, interfacing to this serial port requires an USB-to-serial converter IC or board. After programming is finished, the port is used to monitor any debugging output from the program, in order to keep an eye on the general state of program execution. When program execution is not what the developer expects (i.e. the program crashes), the JTAG debugging port is then used to inspect the state of the program and its variables and set break- and watchpoints. This requires interfacing with the JTAG debug port, which generally requires an external JTAG adapter.

All these external interfaces take up six pins in total, which cannot be used for other purposes while debugging. Especially on devices with small packages, like the ESP32-S3, not being able to use these pins can be limiting to a design.

In order to alleviate this issue, as well as to negate the need for external devices, the ESP32-S3 contains an USB Serial/JTAG Controller, which integrates the functionality of both an USB-to-serial converter as well as those of an USB-to-JTAG adapter. As this device directly interfaces to an external USB host using only the two data lines required by USB Specification 1.1, debugging the ESP32-S3 only requires two pins to be dedicated to this functionality.

29.2 Features

- USB Full-speed device.
- Can be configured to either use internal USB PHY of ESP32-S3 or external PHY via GPIO matrix.
- Fixed function device, hardwired for CDC-ACM (Communication Device Class - Abstract Control Model) and JTAG adapter functionality.
- 2 OUT Endpoints, 3 IN Endpoints in addition to Control Endpoint 0; Up to 64-byte data payload size.
- Internal PHY, so no or very few external components needed to connect to a host computer.
- CDC-ACM adherent serial port emulation is plug-and-play on most modern OSes.
- JTAG interface allows fast communication with CPU debug core using a compact representation of JTAG instructions.
- CDC-ACM supports host controllable chip reset and entry into download mode.

As shown in Figure 29-1, the USB Serial/JTAG Controller consists of an USB PHY, a USB device interface, a JTAG command processor and a response capture unit, as well as the CDC-ACM registers. The PHY and part of the device interface are clocked from a 48 MHz clock derived from the main PLL, the rest of the logic is clocked from APB_CLK. The JTAG command processor is connected to the JTAG debug unit of the main processor; the

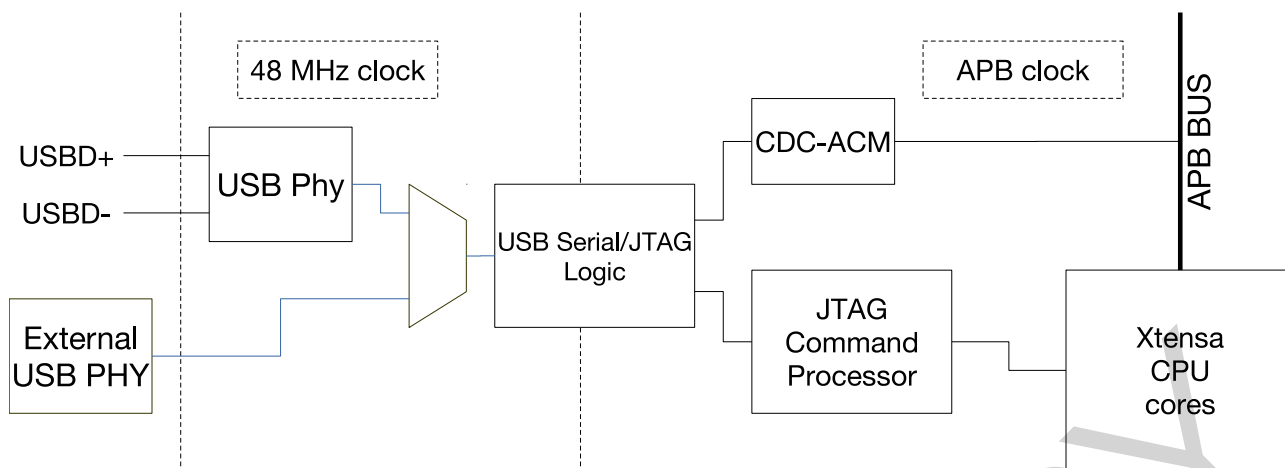

Figure 29-1. USB Serial/JTAG High Level Diagram

CDC-ACM registers are connected to the APB bus and as such can be read from and written to by software running on the main CPU.

Note that while the USB Serial/JTAG device is a USB 2.0 device, it only supports Full-speed (12 Mbps) and not the High-speed (480 Mbps) mode the USB2.0 standard introduced.

Figure 29-2 shows the internal details of the USB Serial/JTAG controller on the USB side. The USB Serial/JTAG Controller consists of an USB 2.0 Full Speed device. It contains a control endpoint, a dummy interrupt endpoint, two bulk input endpoints as well as two bulk output endpoints. Together, these form an USB Composite device, which consists of an CDC-ACM USB class device as well as a vendor-specific device implementing the JTAG interface. On the SoC side, the JTAG interface is directly connected to the debugging interface of the two Xtensa CPUs, allowing debugging of programs running on that core. Meanwhile, the CDC-ACM device is exposed as a set of registers, allowing a program on the CPU to read and write from this. Additionally, the ROM startup code of the SoC contains code allowing the user to reprogram attached flash memory using this interface.

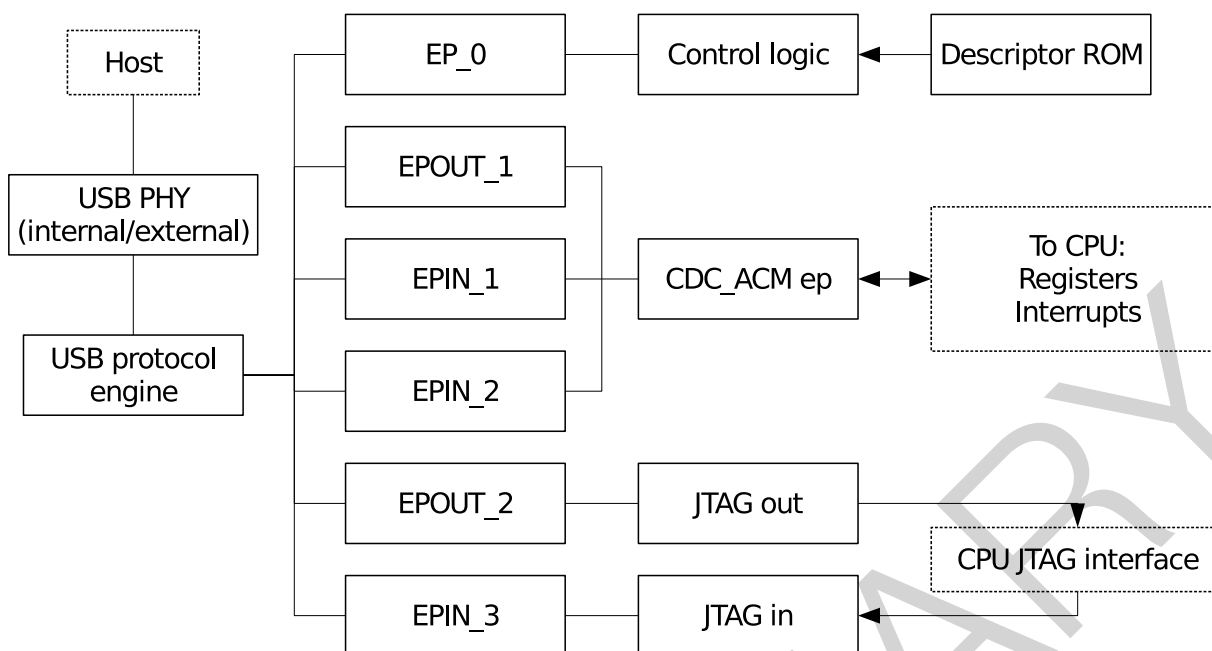

Figure 29-2. USB Serial/JTAG Block Diagram

29.3 Functional Description

The USB Serial/JTAG Controller interfaces with an USB host processor on one side, and the CPU debug hardware as well as the software running on the USB port on the other side.

29.3.1 USB Serial/JTAG host connection

As shown in Figure 29-3, interfacing with an USB host connection on the physical level is done with a PHY. The ESP32-S3 has an internal PHY, which is shared between the USB-OTG and the USB Serial/JTAG hardware. Either one of these can use the internal PHY. Optionally, the signals from the unit not using the internal PHY can be routed out via the GPIO matrix to IO pads. Adding an external USB PHY to these pads results in a second usable USB port.

The actual routing from USB Serial/JTAG Controller and USB-OTG to internal and external PHYs initially is decided using eFuses as described in Table 29-6. This configuration can later be modified using register writes.

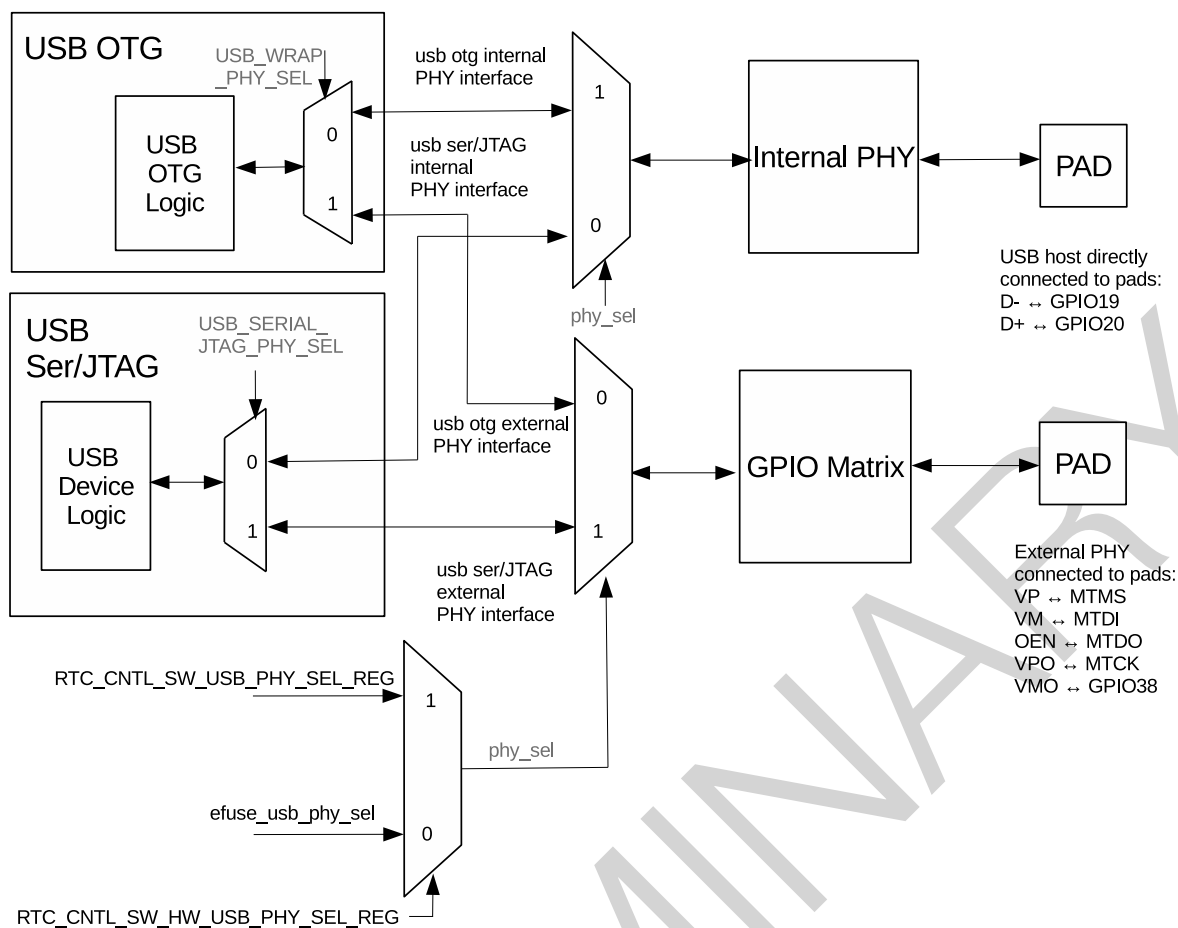

Figure 29-3. USB Serial/JTAG and USB-OTG Internal/External PHY Routing Diagram

The CPU JTAG signals can be routed to the USB Serial/JTAG Controller or external GPIO pads using eFuses and when the user program has started, software control as well. At that time, the JTAG signals from the USB Serial/JTAG can also be routed to the GPIO matrix. This allows debugging a secondary SoC via JTAG using the ESP32-S3 USB Serial/JTAG Controller.

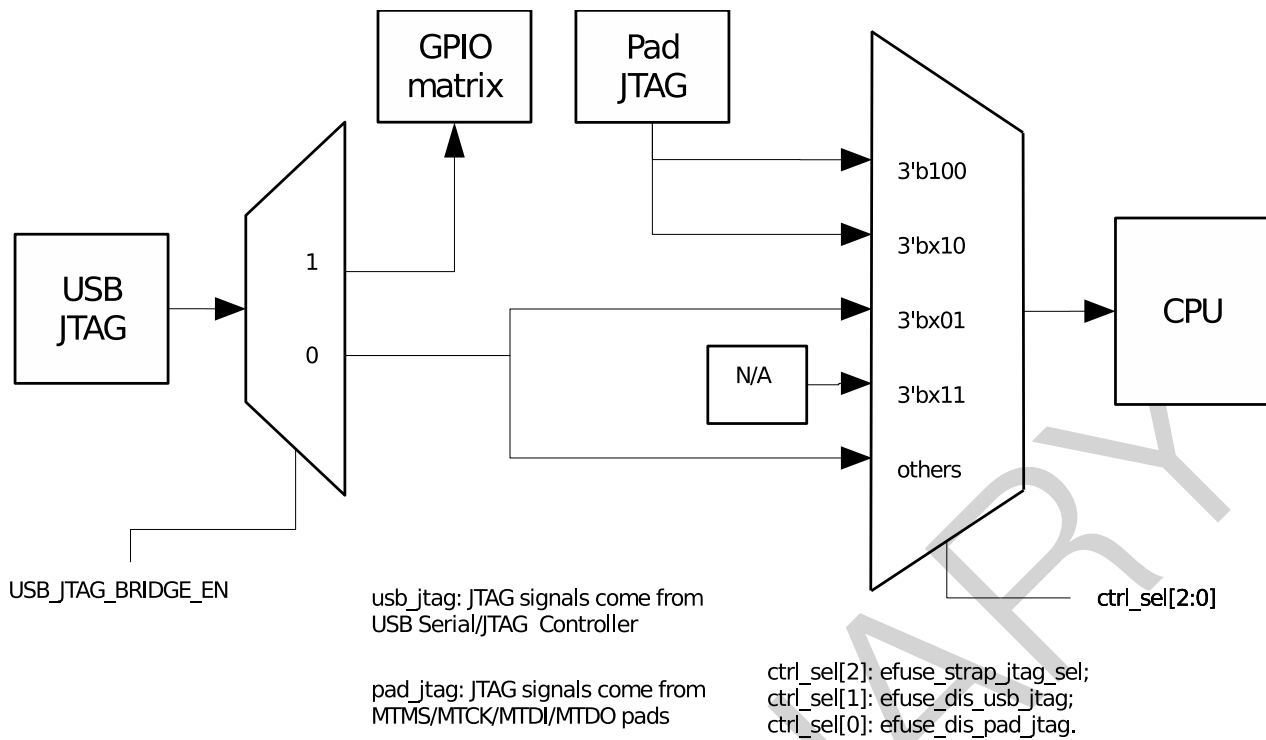

Figure 29-4. JTAG Routing Diagram

29.3.2 CDC-ACM USB Interface Functional Description

The CDC-ACM interface adheres to the standard USB CDC-ACM class for serial port emulation. It contains a dummy interrupt endpoint (which will never send any events, as they are not implemented nor needed) and a Bulk IN as well as a Bulk OUT endpoint for the host's received and sent serial data respectively. These endpoints can handle 64-byte packets at a time, allowing for high throughput. As CDC-ACM is a standard USB device class, a host generally does not need any special installation procedures for it to function: when the USB debugging device is properly connected to a host, the operating system should show a new serial port moments later.

The CDC-ACM interface accepts the following standard CDC-ACM control requests:

Table 29-1. Standard CDC-ACM Control Requests

Command	Action
SEND_BREAK	Accepted but ignored (dummy)
SET_LINE_CODING	Accepted but ignored (dummy)
GET_LINE_CODING	Always returns 9600 baud, no parity, 8 databits, 1 stopbit
SET_CONTROL_LINE_STATE	Set the state of the RTS/DTR lines, see Table 29-2

Aside from general-purpose communication, the CDC-ACM interface also can be used to reset the ESP32-S3 and optionally make it go into download mode in order to flash new firmware. This is done by setting the RTS and DTR lines on the virtual serial port.

Table 29-2. CDC-ACM Settings with RTS and DTR

RTS	DTR	Action
0	0	Clear download mode flag
0	1	Set download mode flag
1	0	Reset ESP32-S3
1	1	No action

Note that if the download mode flag is set when the ESP32-S3 is reset, the ESP32-S3 will reboot into download mode. When this flag is cleared and the chip is reset, the ESP32-S3 will boot from flash. For specific sequences, please refer to Section 29.4. All these functions can also be disabled by programming various eFuses, please refer to Chapter 4 *eFuse Controller* for more details.

29.3.3 CDC-ACM Firmware Interface Functional Description

As the USB Serial/JTAG Controller is connected to the internal APB bus of the ESP32-S3, the CPU can interact with it. This is mainly used to read and write data from and to the virtual serial port on the attached host.

USB CDC-ACM serial data is sent to and received from the host in packets of 0 to 64 bytes in size. When enough CDC-ACM data has accumulated in the host, the host will send a packet to the CDC-ACM receive endpoint, and when the USB Serial/JTAG Controller has a free buffer, it will accept this packet. Conversely, the host will check periodically if the USB Serial/JTAG Controller has a packet ready to be sent to the host, and if so, receive this packet.

Firmware can get notified of new data from the host in one of two ways. First of all, the [USB_SERIAL_JTAG_SERIAL_OUT_EP_DATA_AVAIL](#) bit will remain set to 1 as long as there still is unread host data in the buffer. Secondly, the availability of data will trigger the [USB_SERIAL_JTAG_SERIAL_OUT_RECV_PKT_INT](#) interrupt as well.

When data is available, it can be read by firmware by repeatedly reading bytes from [USB_SERIAL_JTAG_EP1_REG](#). The amount of bytes to read can be determined by checking the [USB_REG_SERIAL_OUT_EP_DATA_AVAIL](#) bit after reading each byte to see if there is more data to read. After all data is read, the USB debug device is automatically readied to receive a new data packet from the host.

When the firmware has data to send, it can do so by putting it in the send buffer and triggering a flush, allowing the host to receive the data in a USB packet. In order to do so, there needs to be space available in the send buffer. Firmware can check this by reading [USB_REG_SERIAL_IN_EP_DATA_FREE](#); a 1 in this register field indicates there is still free room in the buffer. While this is the case, firmware can fill the buffer by writing bytes to the [USB_SERIAL_JTAG_EP1_REG](#) register.

Writing the buffer doesn't immediately trigger sending data to the host. This does not happen until the buffer is flushed; a flush causes the entire buffer to be readied for reception by the USB host at once. A flush can be triggered in two ways: after the 64th byte is written to the buffer, the USB hardware will automatically flush the buffer to the host. Alternatively, firmware can trigger a flush by writing a 1 to [USB_REG_SERIAL_WR_DONE](#).

Regardless of how a flush is triggered, the send buffer will be unavailable for firmware to write into until it has been fully read by the host. As soon as this happens, the [USB_SERIAL_JTAG_SERIAL_IN_EMPTY_INT](#) interrupt will be triggered, indicating the send buffer can receive another 64 bytes.

29.3.4 USB-to-JTAG Interface

The USB-to-JTAG interface uses a vendor-specific class for its implementation. It consists of two endpoints, one to receive commands and one to send responses. Additionally, some less time-sensitive commands can be given as control requests.

29.3.5 JTAG Command Processor

Commands from the host to the JTAG interface are interpreted by the JTAG command processor. Internally, the JTAG command processor implements a full four-wire JTAG bus, consisting of the TCK, TMS and TDI output lines to the Xtensa CPUs, as well as the TDO line signalling back from the CPU to the JTAG response capture unit. These signals adhere to the IEEE 1149.1 JTAG standards. Additionally, there is a SRST line to reset the SoC.

The JTAG command processor parses each received nibble (4-bit value) as a command. As USB data is received in 8-bit bytes, this means each byte contains two commands. The USB command processor will execute high-nibble first and low-nibble second. The commands are used to control the TCK, TMS, TDI, and SRST lines of the internal JTAG bus, as well as signal the JTAG response capture unit that the state of the TDO line (which is driven by the CPU debug logic) needs to be captured.

Of this internal JTAG bus, TCK, TMS, TDI and TDO are connected directly to the JTAG debugging logic of the Xtensa CPUs. SRST is connected to the reset logic of the digital circuitry in the SoC and a high level on this line will cause a digital system reset. Note that the USB Serial/JTAG Controller itself is not affected by SRST.

A nibble can contain the following commands:

Table 29-3. Commands of a Nibble

bit	3	2	1	0
CMD_CLK	0	cap	tms	tdi
CMD_RST	1	0	0	srst
CMD_FLUSH	1	0	1	0
CMD_RSV	1	0	1	1
CMD_REP	1	1	R1	R0

- CMD_CLK will set the TDI and TMS to the indicated values and emit one clock pulse on TCK. If the CAP bit is 1, it will also instruct the JTAG response capture unit to capture the state of the TDO line. This instruction forms the basis of JTAG communication.
- CMD_RST will set the state of the SRST line to the indicated value. This can be used to reset the ESP32-S3.
- CMD_FLUSH will instruct the JTAG response capture unit to flush the buffer of all bits it collected so the host is able to read them. Note that in some cases, a JTAG transaction will end in an odd number of commands and as such an odd number of nibbles. In this case, it is allowable to repeat the CMD_FLUSH to get an even number of nibbles fitting an integer number of bytes.
- CMD_RSV is reserved in the current implementation. The ESP32-S3 will ignore this command when it receives it.
- CMD_REP repeats the last (non-CMD_REP) command a certain number of times. It's intended goal is to compress command streams which repeat the same CMD_CLK instruction multiple times. A command like

CMD_CLK can be followed by multiple CMD_REP commands. The number of repetitions done by one CMD_REP can be expressed as $no_repetitions = (R1 \times 2 + R0) \times (4^{cmd_rep_count})$, where `cmd_rep_count` is how many CMD_REP instructions went directly before it. Note that the CMD_REP is only intended to repeat a CMD_CLK command. Specifically, using it on a CMD_FLUSH command may lead to an unresponsive USB device, needing an USB reset to recover.

29.3.6 USB-to-JTAG Interface: CMD_REP usage example

Here is a list of commands as an illustration of the use of CMD_REP. Note each command is a nibble; in this example the bitwise command stream would be 0x0D 0x5E 0xCF.

1. 0x0 (CMD_CLK: cap=0, tdi=0, tms=0)
2. 0xD (CMD_REP: R1=0, R0=1)
3. 0x5 (CMD_CLK: cap=1, tdi=0, tms=1)
4. 0xE (CMD_REP: R1=1, R0=0)
5. 0xC (CMD_REP: R1=0, R0=0)
6. 0xF (CMD_REP: R1=1, R0=1)

This is what happens at every step:

1. TCK is clocked with the TDI and TMS lines set to 0. No data is captured.
2. TCK is clocked another $(0 \times 2 + 1) \times (4^2) = 1$ time with the same settings as step 1.
3. TCK is clocked with the TDI and TMS lines set to 0. Data on the TDO line is captured.
4. TCK is clocked another $(1 \times 2 + 0) \times (4^0) = 2$ times with the same settings as step 3.
5. Nothing happens: $(0 \times 2 + 0) \times (4^1) = 0$. Note that this does increase `cmd_rep_count` for the next step.
6. TCK is clocked another $(1 \times 2 + 1) \times (4^2) = 48$ times with the same settings as step 3.

In other words: This example stream has the same net effect as command 1 twice, then repeating command 3 for 51 times.

29.3.7 USB-to-JTAG Interface: Response Capture Unit

The response capture unit reads the TDO line of the internal JTAG bus and captures its value when the command parser executes a CMD_CLK with cap=1. It puts this bit into an internal shift register, and writes a byte into the USB buffer when 8 bits have been collected. Of these 8 bits, the least significant one is the one that is read from TDO the earliest.

As soon as either 64 bytes (512 bits) have been collected or a CMD_FLUSH command is executed, the response capture unit will make the buffer available for the host to receive. Note that the interface to the USB logic is double-buffered. This way, as long as USB throughput is sufficient, the response capture unit can always receive more data: while one of the buffers is waiting to be sent to the host, the other one can receive more data. When the host has received data from its buffer and the response capture unit flushes its buffer, the two buffers change position.

This also means that a command stream can cause at most 128 bytes of capture data to be generated (less if there are flush commands in the stream) without the host acting to receive the generated data. If more data is

generated anyway, the command stream is paused and the device will not accept more commands before the generated capture data is read out.

Note that in general, the logic of the response capture unit tries not to send zero-byte responses: for instance, sending a series of CMD_FLUSH commands will not cause a series of zero-byte USB responses to be sent. However, in the current implementation, some zero-byte responses may be generated in extraordinary circumstances. It's recommended to ignore these responses.

29.3.8 USB-to-JTAG Interface: Control Transfer Requests

Aside from the command processor and the response capture unit, the USB-to-JTAG interface also understands some control requests, as documented in the table below:

Table 29-4. USB-to-JTAG Control Requests

bmRequestType	bRequest	wValue	wIndex	wLength	Data
01000000b	0 (VEND_JTAG_SETDIV)	[divider]	interface	0	None
01000000b	1 (VEND_JTAG_SETIO)	[iobits]	interface	0	None
11000000b	2 (VEND_JTAG_GETTDO)	0	interface	1	[iostate]
10000000b	6 (GET_DESCRIPTOR)	0x2000	0	256	[jtag cap desc]

- VEND_JTAG_SETDIV sets the divider used. This directly affects the duration of a TCK clock pulse. The TCK clock pulses are derived from APB_CLK, which is divided down using an internal divider. This control request allows the host to set this divider. Note that on startup, the divider is set to 2, meaning the TCK clock rate will generally be 40 MHz.
- VEND_JTAG_SETIO can bypass the JTAG command processor to set the internal TDI, TDO, TMS and SRST lines to given values. These values are encoded in the wValue field in the format of 11'b0, srst, trst, tck, tms, tdi.
- VEND_JTAG_GETTDO can bypass the JTAG response capture unit to read the internal TDO signal directly. This request returns one byte of data, of which the least significant bit represents the status of the TDO line.
- GET_DESCRIPTOR is a standard USB request, however it can also be used with a vendor-specific wValue of 0x2000 to get the JTAG capabilities descriptor. This returns a certain amount of bytes representing the following fixed structure, which describes the capabilities of the USB-to-JTAG adapter. This structure allows host software to automatically support future revisions of the hardware without needing an update.

The JTAG capabilities descriptor of the ESP32-S3 is as follows. Note that all 16-bit values are little-endian.

Table 29-5. JTAG Capabilities Descriptor

Byte	Value	Description
0	1	JTAG protocol capabilities structure version
1	10	Total length of JTAG protocol capabilities
2	1	Type of this struct: 1 for speed capabilities struct
3	8	Length of this speed capabilities struct
4 ~ 5	8000	APB_CLK speed in 10 kHz increments. Note that the maximal TCK speed is half of this
6 ~ 7	1	Minimum divisor
8 ~ 9	255	Maximum divisor

29.4 Recommended Operation

29.4.1 Internal/external PHY selection

As the ESP32-S3 only has a single internal PHY, at first programming you may need to decide how that is going to be used in the intended application by burning eFuses to affect the initial USB configuration. This affects ROM download mode as well: while both USB-OTG as well as the USB Serial/JTAG controller allows serial programming, only USB-OTG supports the DFU protocol and only the USB Serial/JTAG controller supports JTAG debugging over USB. Even when not using USB, eFuse configuration is required when an external JTAG adapter will be used.

Table 29-6 indicates which eFuse to burn to get a certain boot-up configuration. Note that this is mostly relevant for the configuration in download mode and the bootloader as the configuration can be altered at runtime as soon as user code is running.

Table 29-6. Use cases and eFuse settings

Use case	eFuses	Note
USB serial/JTAG on internal PHY only	None	-
USB OTG on internal PHY only	EFUSE_USB_PHY_SEL + EFUSE_DIS_USB_JTAG	JTAG on GPIO pins
USB serial/JTAG on internal PHY, OTG on external PHY	None	-
USB OTG on internal PHY, USB serial/JTAG on external	EFUSE_USB_PHY_SEL	-

After the user program is running, it can modify the initial configuration by setting registers. Specifically, [RTC_CNTL_SW_HW_USB_PHY_SEL](#) can be used to have software override the effect of [EFUSE_USB_PHY_SEL](#): if this bit is set, the USB PHY selection logic will use the value of the [RTC_CNTL_SW_USB_PHY_SEL](#) bit in place of that of [EFUSE_USB_PHY_SEL](#).

29.4.2 Runtime operation

There is very little setup needed in order to use the USB Serial/JTAG Device. The USB-to-JTAG hardware itself does not need any setup aside from the standard USB initialization the host operating system already does. The CDC-ACM emulation, on the host side, also is plug-and-play.

On the firmware side, very little initialization should be needed either: the USB hardware is self-initializing and after boot-up, if a host is connected and listening on the CDC-ACM interface, data can be exchanged as described above without any specific setup aside from the firmware optionally setting up an interrupt service handler.

One thing to note is that there may be situations where the host is either not attached or the CDC-ACM virtual port is not opened. In this case, the packets that are flushed to the host will never be picked up and the transmit buffer will never be empty. It is important to detect this and time out, as this is the only way to reliably detect that the port on the host side is closed.

Another thing to note is that the USB device is dependent on both the PLL for the 48 MHz USB PHY clock, as well as APB_CLK. Specifically, an APB_CLK of 40 MHz or more is required for proper USB compliant operation, although the USB device will still function with most hosts with an APB_CLK as low as 10 MHz. Behaviour

shown when this happens is dependent on the host USB hardware and drivers, and can include the device being unresponsive and it disappearing when first accessed.

More specifically, the APB_CLK will be affected by clock gating the USB Serial/JTAG Controller, which may happen in Light-sleep. Additionally, the USB serial/JTAG Controller (as well as the attached Xtensa CPUs) will be entirely powered down in Deep-sleep mode. If a device needs to be debugged in either of these two modes, it may be preferable to use an external JTAG debugger and serial interface instead.

The CDC-ACM interface can also be used to reset the SoC and take it into or out of download mode. Generating the correct sequence of handshake signals can be a bit complicated: Most operating systems only allow setting or resetting DTR and RTS separately, and not in tandem. Additionally, some drivers (e.g. the standard CDC-ACM driver on Windows) do not set DTR until RTS is set and the user needs to explicitly set RTS in order to 'propagate' the DTR value. These are the recommended procedures:

To reset the SoC into download mode:

Table 29-7. Reset SoC into Download Mode

Action	Internal state	Note
Clear DTR	RTS=?, DTR=0	Initialize to known values
Clear RTS	RTS=0, DTR=0	-
Set DTR	RTS=0, DTR=1	Set download mode flag
Clear RTS	RTS=0, DTR=1	Propagate DTR
Set RTS	RTS=1, DTR=1	-
Clear DTR	RTS=1, DTR=0	Reset SoC
Set RTS	RTS=1, DTR=0	Propagate DTR
Clear RTS	RTS=0, DTR=0	Clear download flag

To reset the SoC into booting from flash:

Table 29-8. Reset SoC into Booting

Action	Internal state	Note
Clear DTR	RTS=?, DTR=0	-
Clear RTS	RTS=0, DTR=0	Clear download flag
Set RTS	RTS=1, DTR=0	Reset SoC
Clear RTS	RTS=0, DTR=0	Exit reset

29.5 Register Summary

The addresses in this section are relative to USB Serial/JTAG Controller base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
Configuration Registers			
USB_SERIAL_JTAG_EP1_REG	Endpoint 1 FIFO register	0x0000	R/W
USB_SERIAL_JTAG_EP1_CONF_REG	Endpoint 1 configure and status register	0x0004	varies
USB_SERIAL_JTAG_CONF0_REG	Configure 0 register	0x0018	R/W
USB_SERIAL_JTAG_MISC_CONF_REG	MISC register	0x0044	R/W
USB_SERIAL_JTAG_MEM_CONF_REG	Memory power control	0x0048	R/W
USB_SERIAL_JTAG_TEST_REG	USB Internal PHY test register	0x001C	varies
Interrupt Registers			
USB_SERIAL_JTAG_INT_RAW_REG	Raw status interrupt	0x0008	R/WTC/SS
USB_SERIAL_JTAG_INT_ST_REG	Masked interrupt	0x000C	RO
USB_SERIAL_JTAG_INT_ENA_REG	Interrupt enable bits	0x0010	R/W
USB_SERIAL_JTAG_INT_CLR_REG	Interrupt clear bits	0x0014	WT
Status Registers			
USB_SERIAL_JTAG_JFIFO_ST_REG	USB-JTAG FIFO status	0x0020	varies
USB_SERIAL_JTAG_FRAM_NUM_REG	SOF frame number	0x0024	RO
USB_SERIAL_JTAG_IN_EP0_ST_REG	IN Endpoint 0 status	0x0028	RO
USB_SERIAL_JTAG_IN_EP1_ST_REG	IN Endpoint 1 status	0x002C	RO
USB_SERIAL_JTAG_IN_EP2_ST_REG	IN Endpoint 2 status	0x0030	RO
USB_SERIAL_JTAG_IN_EP3_ST_REG	IN Endpoint 3 status	0x0034	RO
USB_SERIAL_JTAG_OUT_EP0_ST_REG	OUT Endpoint 0 status	0x0038	RO
USB_SERIAL_JTAG_OUT_EP1_ST_REG	OUT Endpoint 1 status	0x003C	RO
USB_SERIAL_JTAG_OUT_EP2_ST_REG	OUT Endpoint 2 status	0x0040	RO
Version Register

30 SD/MMC Host Controller (SDHOST)

30.1 Overview

The ESP32-S3 memory card interface controller provides a hardware interface between the Advanced Peripheral Bus (APB) and an external memory device. The memory card interface allows the ESP32-S3 to be connected to SDIO memory cards, MMC cards and devices with a CE-ATA interface. It supports two external cards (Card0 and Card1). And all SD/MMC module interface signal only connect to GPIO pad by GPIO matrix.

30.2 Features

This module supports the following features:

- Two external cards
- SD Memory Card standard: V3.0 and V3.01
- MMC: V4.41, V4.5, and V4.51
- CE-ATA: V1.1
- 1-bit, 4-bit, and 8-bit modes

The SD/MMC controller topology is shown in Figure 30-1. The controller supports two peripherals which cannot be functional at the same time.

Figure 30-1. SD/MMC Controller Topology

30.3 SD/MMC External Interface Signals

The primary external interface signals, which enable the SD/MMC controller to communicate with an external device, are clock (sdhost_cclk_out_1.eg:card1), command (sdhost_ccmd_out_1) and data signals (sdhost_cdata_in_1[7:0]/sdhost_cdata_out_1[7:0]). Additional signals include the card interrupt, card detect, and write-protect signals. The direction of each signal is shown in Figure 30-2. The direction and description of each pin are listed in Table 30-1.

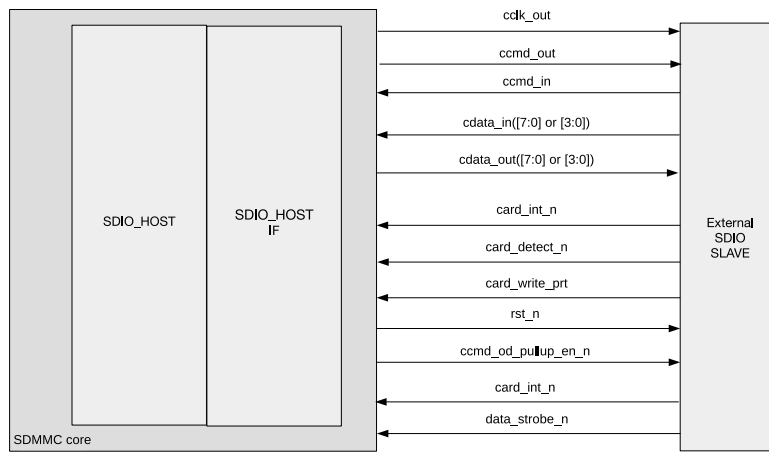

Figure 30-2. SD/MMC Controller External Interface Signals

Table 30-1. SD/MMC Signal Description

Pin	Direction	Description
sdhost_cclk_out	Output	Clock signals for slave device
sdhost_ccmd	Duplex	Duplex command/response lines
sdhost_cdata	Duplex	Duplex data read/write lines
sdhost_card_detect_n	Input	Card detection input line
sdhost_card_write_prt	Input	Card write protection status input
sdhost_rst_n	Output	Hardware reset for MMC4.4 cards
sdhost_ccmd_od_pullup_en_n	output	Card Cmd Open-Drain Pullup
sdhost_card_int_n	Input	Interrupt pin for eSDIO devices
sdhost_data_strobe_n	Input	Card HS400 Data Strobe

30.4 Functional Description

30.4.1 SD/MMC Host Controller Architecture

The SD/MMC host controller consists of two main functional blocks, as shown in Figure 30-3:

- Bus Interface Unit (BIU): It provides APB interfaces for registers, data access method for RMA, and data read and write operation by DMA.
- Card Interface Unit (CIU): It handles external memory card interface protocols. It also provides clock control.

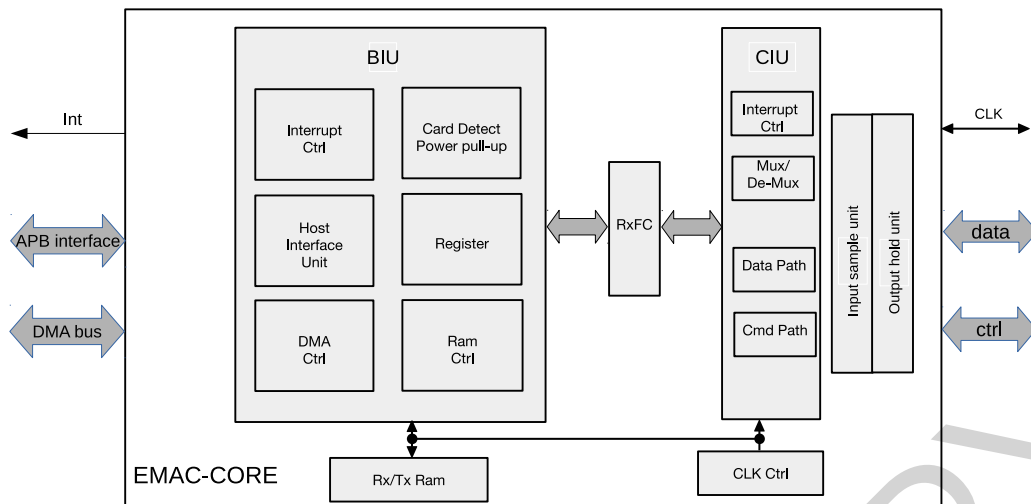

Figure 30-3. SDIO Host Block Diagram

30.4.1.1 Bus Interface Unit (BIU)

The BIU provides the access to registers and RAM data through the Host Interface Unit (HIU). Additionally, it provides a method to access to memory data through a DMA interface. Figure 30-3 illustrates the internal components of the BIU. Figure 30-9 illustrates the clock section. The BIU provides the following functions:

- Host interface
- DMA interface
- Interrupt control
- Register access
- FIFO access
- Power/pull-up control and card detection

30.4.1.2 Card Interface Unit (CIU)

The CIU module implements the card-specific protocols. Within the CIU, the command path control unit and data path control unit are used to interface with the command and data ports, respectively, of the SD/MMC/CE-ATA cards. The CIU also provides clock control. Figure 30-3 illustrates the internal structure of the CIU, which consists of the following primary functional blocks:

- Command path
- Data path
- SDIO interrupt control
- Clock control
- Mux/De-Mux unit

30.4.2 Command Path

The command path performs the following functions:

- Configures clock parameters
- Configures card command parameters
- Sends commands to card bus (sdhost_ccmd_out line)
- Receives responses from card bus (sdhost_ccmd_in line)
- Sends responses to BIU
- Drives the P-bit on the command line

The command path State Machine is shown in Figure 30-4.

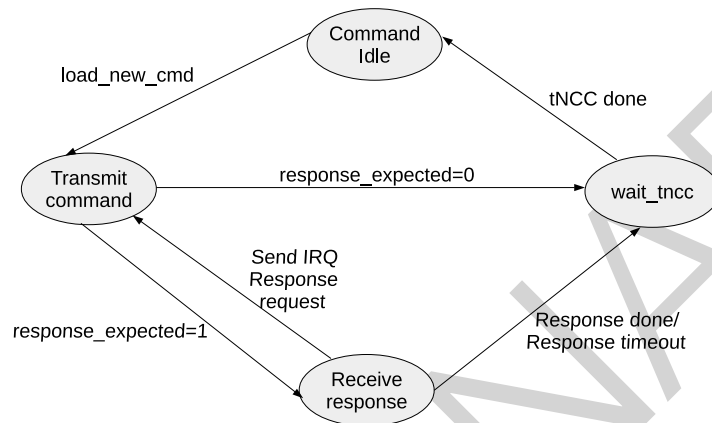

Figure 30-4. Command Path State Machine

30.4.3 Data Path

The data path block pops RAM data and transmits them on sdhost_cdata_out during a write-data transfer, or it receives data on sdhost_cdata_in and pushes them into RAM during a read-data transfer. The data path loads new data parameters, i.e., expected data, read/write data transfer, stream/block transfer, block size, byte count, card type, timeout registers, etc., whenever a data transfer command is not in progress.

If the SDHOST_DATA_EXPECTED bit is set in SDHOST_CMD_REG register, the new command is a data-transfer command and the data path starts one of the following operations:

- Transmitting data if the SDHOST_READ_WRITE bit is 1
- Receiving data if the SDHOST_READ_WRITE bit is 0

30.4.3.1 Data Transmit Operation

The module starts data transmission two clock cycles after a response for the data-write command is received. This occurs even if the command path detects a response error or a cyclic redundancy check (CRC) error in a response. If no response is received from the card until the response timeout, no data are transmitted. Depending on the value of the SDHOST_TRANSFER_MODE bit in SDHOST_CMD_REG register, the data-transmit state machine adds data to the card's data bus in a stream or in block(s). The data transmit state machine is shown in Figure 30-5.

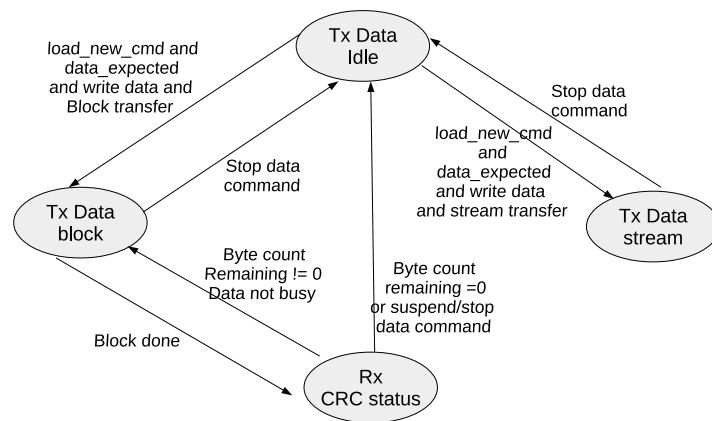

Figure 30-5. Data Transmit State Machine

30.4.3.2 Data Receive Operation

The module receives data two clock cycles after the end bit of a data-read command, even if the command path detects a response error or a CRC error. If no response is received from the card and a response timeout occurs, the BIU does not receive a signal about the completion of the data transfer. If the command sent by the CIU is an illegal operation for the card, it would prevent the card from starting a read-data transfer, and the BIU will not receive a signal about the completion of the data transfer.

If no data is received by the data timeout, the data path signals a data timeout to the BIU, which marks an end to the data transfer. Based on the value of the SDHOST_TRANSFER_MODE bit in SDHOST_CMD_REG register, the data-receive state machine gets data from the card's data bus in a stream or block(s). The data receive state machine is shown in Figure 30-6.

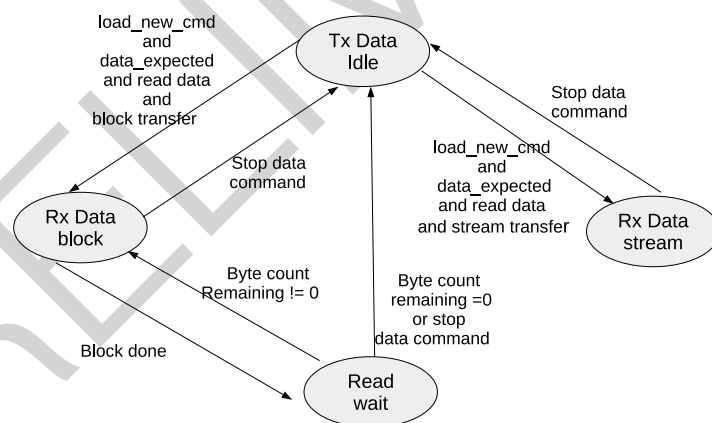

Figure 30-6. Data Receive State Machine

30.5 Software Restrictions for Proper CIU Operation

- Only one card at a time can be selected to execute a command or data transfer. For example, when data are being transferred to or from a card, a new command must not be issued to another card. A new command, however, can be issued to the same card, allowing it to read the device status or stop the transfer.
- Only one command at a time can be issued for data transfers.

- During an open-ended card-write operation, if the card clock is stopped due to RAM being empty, the software must fill RAM with data first, and then start the card clock. Only then can it issue a stop/abort command to the card.
- During an SDIO/Combo card transfer, if the card function is suspended and the software wants to resume the suspended transfer, it must first reset RAM, setting SDHOST_FIFO_RESET bits and then issue the resume command as if it were a new data-transfer command.
- When issuing card reset commands (CMD0, CMD15 or CMD52_reset), while a card data transfer is in progress, the software must set the SDHOST_STOP_ABORT_CMD bit in SDHOST_CMD_REG register, so that the CIU can stop the data transfer after issuing the card reset command.
- When the data's end bit error is set in the SDHOST_RINTSTS_REG register, the CIU does not guarantee SDIO interrupts. In such a case, the software ignores SDIO interrupts and issues a stop/abort command to the card, so that the card stops sending read-data.
- If the card clock is stopped due to RAM being full during a card read, the software will read at least two RAM locations to restart the card clock.
- Only one CE-ATA device at a time can be selected for a command or data transfer. For example, when data are transferred from a CE-ATA device, a new command should not be sent to another CE-ATA device.
- If a CE-ATA device's interrupts are enabled (nIEN=0), a new SDHOST_RW_BLK command should not be sent to the same device if the execution of a SDHOST_RW_BLK command is already in progress. Only the CCSD can be sent while waiting for the CCS.
- If, however, a CE-ATA device's interrupts are disabled (nIEN=1), a new command can be issued to the same device, allowing it to read status information.
- Open-ended transfers are not supported in CE-ATA devices.
- The sdhost_send_auto_stop signal is not supported (software should not set the sdhost_send_auto_stop bit) in CE-ATA transfers.

After configuring the command start bit to 1, the values of the following registers cannot be changed before a command has been issued:

- CMD - command
- CMDARG - command argument
- BYTCNT - byte count
- BLKSIZ - block size
- CLKDIV - clock divider
- CKLENA - clock enable
- CLKSRC - clock source
- TMOUT - timeout
- CTYPE - card type

30.6 RAM for Receiving and Sending Data

The submodule RAM is a buffer area for sending and receiving data. It can be divided into two units: the one is for sending data, and the other is for receiving data. The process of sending and receiving data can also be achieved by the CPU and DMA for reading and writing. The latter method is described in detail in Section 30.8.

30.6.1 TX RAM Module

There are two ways to enable a write operation: DMA and CPU read/write.

If SDIO-sending is enabled, data can be written to the TX RAM module by APB interface. Data will be written to register `SDHOST_BUFFIFO_REG` from the CPU, directly, by an APB interface.

Another way of data transmission is by DMA.

30.6.2 RX RAM Module

There are two ways to enable a read operation: DMA and CPU read/write.

When the data path receives data, the data will be written to the RX RAM. Then, these data can be read with the APB method at the reading end. Register `SDHOST_BUFFIFO_REG` can be read by the APB directly.

Another way of receiving data is by DMA.

30.7 DMA Descriptor Chain

Each linked list module consists of two parts: the linked list itself and a data buffer. In other words, each module points to a unique data buffer and the linked list that follows the module. Figure 30-7 shows the descriptor chain.

Figure 30-7. Descriptor Chain

30.8 The Structure of DMA descriptor chain

Each linked list consists of four words. As is shown below, Figure 30-8 demonstrates the linked list's structure, and Table 30-2, Table 30-3, Table 30-4, Table 30-5 provide the descriptions of linked lists.

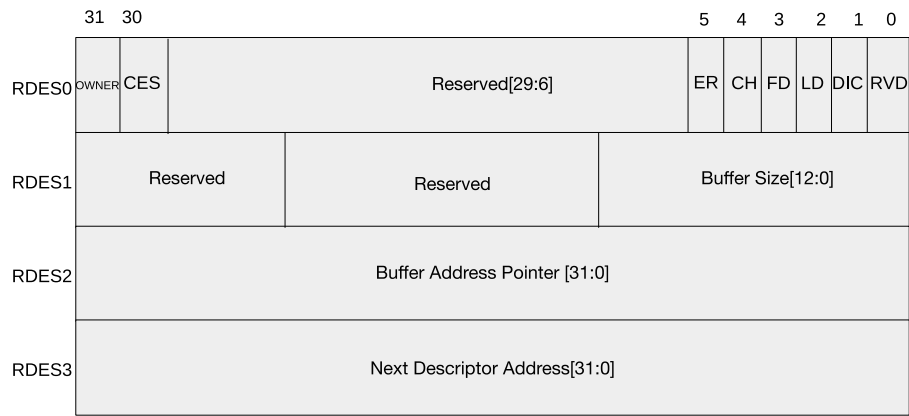

Figure 30-8. The Structure of a Linked List

The DES0 element contains control and status information.

Table 30-2. Word DES0 of SD/MMC GDMA Linked List

Bits	Name	Description
31	OWNER	When set, this bit indicates that the descriptor is owned by the DMA Controller. When reset, it indicates that the descriptor is owned by the Host. The DMA clears this bit when it completes the data transfer.
30	CES (Card Error Summary)	These error bits indicate the status of the transition to or from the card. The following bits are also present in SD-HOST_RINTSTS_REG, which indicates their digital logic OR gate. <ul style="list-style-type: none"> • EBE: End Bit Error • RTO: Response Time out • RCRC: Response CRC • SBE: Start Bit Error • DRTO: Data Read Timeout • DCRC: Data CRC for Receive • RE: Response Error
29:6	Reserved	Reserved
5	ER (End of Ring)	When set, this bit indicates that the descriptor list has reached its final descriptor. The DMA Controller then returns to the base address of the list, creating a Descriptor Chain.
4	CH (Second Address Chained)	When set, this bit indicates that the second address in the descriptor is the Next Descriptor address. When this bit is set, BS2 (DES1[25:13]) should be all zeros.

Bits	Name	Description
3	FD (First Descriptor)	When set, this bit indicates that this descriptor contains the first buffer of the data. If the size of the first buffer is 0, the Next Descriptor contains the beginning of the data.
2	LD (Last Descriptor)	This bit is associated with the last block of a DMA transfer. When set, the bit indicates that the buffers pointed by this descriptor are the last buffers of the data. After this descriptor is completed, the remaining byte count is 0. In other words, after the descriptor with the LD bit set is completed, the remaining byte count should be 0.
1	DIC (Disable Interrupt on Completion)	When set, this bit will prevent the setting of the TI/RI bit of the DMA Status Register (IDSTS) for the data that ends in the buffer pointed by this descriptor.
0	Reserved	Reserved

The DES1 element contains the buffer size.

Table 30-3. Word DES1 of SD/MMC GDMA Linked List

Bits	Name	Description
31:26	Reserved	Reserved
25:13	Reserved	Reserved
12:0	BS (Buffer Size)	Indicates the size of the data buffer (in Byte), which must be a multiple of four. In the case where the buffer size is not a multiple of four, the resulting behavior is undefined. This field should not be zero.

The DES2 element contains the address pointer to the data buffer.

Table 30-4. Word DES2 of SD/MMC GDMA Linked List

Bits	Name	Description
31:0	Buffer Address Pointer	These bits indicate the physical address of the data buffer. And the buffer address must be word-aligned.

The DES3 element contains the address pointer to the next descriptor if the present descriptor is not the last one in a chained descriptor structure.

Table 30-5. Word DES3 of SD/MMC GDMA Linked List

Bits	Name	Description
31:0	Next Descriptor Address	If CH (DES0[4]) is set, this bit contains the address pointer to the next descriptor.

Bits	Name	Description
		If this is not the last descriptor in a chained descriptor structure, the address pointer to the next descriptor should be: DES3[1:0] = 0.

30.9 Initialization

30.9.1 DMA Initialization

The DMA Controller initialization should proceed as follows:

1. Write to the DMA Bus Mode Register ([SDHOST_BMOD_REG](#)) will set the Host bus's access parameters.
2. Write to the DMA Interrupt Enable Register ([SDHOST_IDINTEN_REG](#)) will mask any unnecessary interrupt causes.
3. The software driver creates either the inlink or the outlink descriptors. Then, it writes to the DMA Descriptor List Base Address Register ([SDHOST_DBADDR_REG](#)), providing the DMA Controller with the starting address of the list.
4. The DMA Controller engine attempts to acquire descriptors from descriptor lists.

30.9.2 DMA Transmission Initialization

The DMA transmission occurs as follows:

1. The Host sets up the elements (DES0-DES3) for transmission, and sets the OWNER bit (DES0[31]). The Host also prepares the data buffer.
2. The Host programs the write-data command in the CMD register in BIU.
3. The Host also programs the required transmit threshold (SDHOST_TX_WMARK field in [SDHOST_FIFOTH_REG](#) register).
4. The DMA Controller engine fetches the descriptor and checks the OWNER bit. If the OWNER bit is not set, it means that the host owns the descriptor. In this case, the DMA Controller enters a suspend-state and asserts the Descriptor Unable interrupt in the [SDHOST_IDSTS_REG](#) register. In such a case, the host needs to release the DMA Controller by writing any value to [SDHOST_PLDMND_REG](#).
5. It then waits for the Command Done (CD) bit in [DHOST_RINTSTS_REG](#) register and no errors from BIU, which indicates that a transfer has completed.
6. Subsequently, the DMA Controller engine waits for a DMA interface request from BIU. This request will be generated, based on the programmed transmit-threshold value. For the last bytes of data which cannot be accessed using a burst, single transfers are performed on the AHB Master Interface.
7. The DMA Controller fetches the transmit data from the data buffer in the Host memory and transfers them to RAM for transmission to card.
8. When data span across multiple descriptors, the DMA Controller fetches the next descriptor and extends its operation using the following descriptor. The last descriptor bit indicates whether the data span multiple descriptors or not.

9. When data transmission is complete, the status information is updated in the [SDHOST_IDSTS_REG](#) register by setting the SDHOST_IDSTS_TI, if it has already been enabled. Also, the OWNER bit is cleared by the DMA Controller by performing a write transaction to DES0.

30.9.3 DMA Reception Initialization

The DMA reception occurs as follows:

1. The Host sets up the element (DES0-DES3) for reception, and sets the OWNER bit (DES0[31]).
2. The Host programs the read-data command in the CMD register in BIU.
3. Then, the Host programs the required level of the receive-threshold (SDHOST_RX_WMARK field in [SDHOST_FIFOTH_REG](#) register).
4. The DMA Controller engine fetches the descriptor and checks the OWNER bit. If the OWNER bit is not set, it means that the host owns the descriptor. In this case, the DMA enters a suspend-state and asserts the Descriptor Unable interrupt in the [SDHOST_IDSTS_REG](#) register. In such a case, the host needs to release the DMA Controller by writing any value to [SDHOST_PLDMND_REG](#).
5. It then waits for the Command Done (CD) bit and no errors from BIU, which indicates that a reception can be done.
6. The DMA Controller engine then waits for a DMA interface request from BIU. This request will be generated, based on the programmed receive-threshold value. For the last bytes of the data which cannot be accessed using a burst, single transfers are performed on the AHB.
7. The DMA Controller fetches the data from RAM and transfers them to the Host memory.
8. When data span across multiple descriptors, the DMA Controller will fetch the next descriptor and extend its operation using the following descriptor. The last descriptor bit indicates whether the data span multiple descriptors or not.
9. When data reception is complete, the status information is updated in the [SDHOST_IDSTS_REG](#) register by setting SDHOST_IDSTS_RI, if it has already been enabled. Also, the OWNER bit is cleared by the DMA Controller by performing a write-transaction to DES0.

30.10 Clock Phase Selection

If the setup time requirements for the input or output data signal are not met, users can specify the clock phase, as shown in the figure [30-9](#).

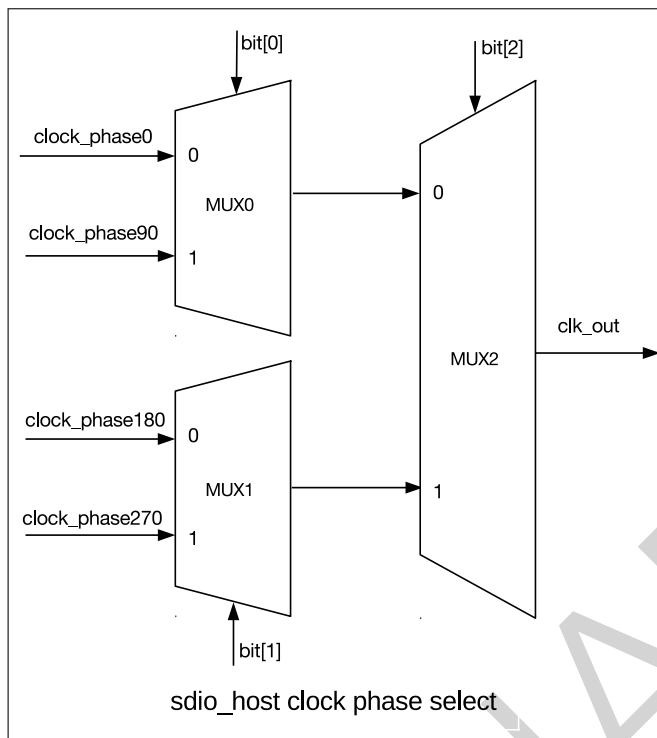

Figure 30-9. Clock Phase Selection

This issue can be fixed by configuring register [SDHOST_CLK_DIV_EDGE_REG](#). For example, set CCLKIN_EDGE_DRV_SEL bit to 0 to drive the output data in phase0, and set the CCLKIN_EDGE_SAM_SEL bit to 1 to select phase90 to sample the data from SDIO slave, if there are still timing issue, please set bit 4 or 6 to use phase180 or phase 270 to sample the data from SDIO slave.

Please find detailed information on the clock phase selection register [SDHOST_CLK_DIV_EDGE_REG](#) in Section Registers.

Table 30-6. SDHOST Clk Phase Selection

Clock phase	phase_select value
0	0
90	1
180	4
270	6

30.11 Interrupt

Interrupts can be generated as a result of various events. The [SDHOST_IDSTS_REG](#) register contains all the bits that might cause an interrupt. The [SDHOST_IDINTEN_REG](#) register contains an enable bit for each of the events that can cause an interrupt.

There are two groups of summary interrupts, "Normal" ones (bit8 [SDHOST_IDSTS_NIS](#)) and "Abnormal" ones (bit9 [SDHOST_IDSTS_AIS](#)), as outlined in the [SDHOST_IDSTS_REG](#) register. Interrupts are cleared by writing 1 to the position of the corresponding bit. When all the enabled interrupts within a group are cleared, the corresponding summary bit is also cleared. When both summary bits are cleared, the interrupt signal connected to CPU is de-asserted (stops signalling).

Interrupts are not queued up, and if a new interrupt-event occurs before the driver has responded to it, no additional interrupts are generated. For example, the SDHOST_IDSTS_RI indicates that one or more data were transferred to the Host buffer.

An interrupt is generated only once for concurrent events. The driver must scan the [SDHOST_IDSTS_REG](#) register for the interrupt cause.

PRELIMINARY

30.12 Register Summary

The addresses in this section are relative to SD/MMC Host Controller base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
SDHOST_CTRL_REG	Control register	0x0000	R/W
SDHOST_CLKDIV_REG	Clock divider configuration register	0x0008	R/W
SDHOST_CLKSRC_REG	Clock source selection register	0x000C	R/W
SDHOST_CLKENA_REG	Clock enable register	0x0010	R/W

PRELIMINARY

30.13 Registers

The addresses in this section are relative to SD/MMC Host Controller base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 30.1. SDHOST_CTRL_REG (0x0000)

(reserved)	(reserved)	(reserved)	SDHOST_CEATA_DEVICE_INTERRUPT_STATUS	SDHOST_SEND_AUTO_STOP_CCSD	SDHOST_SEND_CCSD	SDHOST_ABORT_READ_DATA	SDHOST_SEND_IRO_RESPONSE	(reserved)	SDHOST_READ_WAIT	(reserved)	SDHOST_INT_ENABLE	SDHOST_DMA_RESET	SDHOST_FIFO_RESET	SDHOST_CONTROLLER_RESET		
31	25	24	23	12	11	10	9	8	7	6	5	4	3	2	1	0
0x00	1	0x000	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Reset

SDHOST_CEATA_DEVICE_INTERRUPT_STATUS Software should appropriately write to this bit after the power-on reset or any other reset to the CE-ATA device. After reset, the CE-ATA device's interrupt is usually disabled ($nIEN = 1$). If the host enables the CE-ATA device's interrupt, then software should set this bit. (R/W)

SDHOST_SEND_AUTO_STOP_CCSD Always set `SDHOST_SEND_AUTO_STOP_CCSD` and `SDHOST_SEND_CCSD` bits together; `SDHOST_SEND_AUTO_STOP_CCSD` should not be set independently of `send_ccsd`. When set, SD/MMC automatically sends an internally-generated STOP command (CMD12) to the CE-ATA device. After sending this internally-generated STOP command, the Auto Command Done (ACD) bit in `SDHOST_RINTSTS_REG` is set and an interrupt is generated for the host, in case the ACD interrupt is not masked. After sending the Command Completion Signal Disable (CCSD), SD/MMC automatically clears the `SDHOST_SEND_AUTO_STOP_CCSD` bit. (R/W)

SDHOST_SEND_CCSD When set, SD/MMC sends CCSD to the CE-ATA device. Software sets this bit only if the current command is expecting CCS (that is, `RW_BLK`), and if interrupts are enabled for the CE-ATA device. Once the CCSD pattern is sent to the device, SD/MMC automatically clears the `SDHOST_SEND_CCSD` bit. It also sets the Command Done (CD) bit in the `SDHOST_RINTSTS_REG` register, and generates an interrupt for the host, in case the Command Done interrupt is not masked.

NOTE: Once the `SDHOST_SEND_CCSD` bit is set, it takes two card clock cycles to drive the CCSD on the CMD line. Due to this, within the boundary conditions the CCSD may be sent to the CE-ATA device, even if the device has signalled CCS. (R/W)

Continued on the next page...

Register 30.1. SDHOST_CTRL_REG (0x0000)

Continued from the previous page...

SDHOST_ABORT_READ_DATA After a suspend-command is issued during a read-operation, software polls the card to find when the suspend-event occurred. Once the suspend-event has occurred, software sets the bit which will reset the data state machine that is waiting for the next block of data. This bit is automatically cleared once the data state machine is reset to idle. (R/W)

SDHOST_SEND_IRQ_RESPONSE Bit automatically clears once response is sent. To wait for MMC card interrupts, host issues CMD40 and waits for interrupt response from MMC card(s). In the meantime, if host wants SD/MMC to exit waiting for interrupt state, it can set this bit, at which time SD/MMC command state-machine sends CMD40 response on bus and returns to idle state. (R/W)

SDHOST_READ_WAIT For sending read-wait to SDIO cards. (R/W)

SDHOST_INT_ENABLE Global interrupt enable/disable bit. 0: Disable; 1: Enable. (R/W)

SDHOST_DMA_RESET To reset DMA interface, firmware should set bit to 1. This bit is auto-cleared after two AHB clocks. (R/W)

SDHOST_FIFO_RESET To reset FIFO, firmware should set bit to 1. This bit is auto-cleared after completion of reset operation.

Note: FIFO pointers will be out of reset after 2 cycles of system clocks in addition to synchronization delay (2 cycles of card clock), after the fifo_reset is cleared. (R/W)

SDHOST_CONTROLLER_RESET To reset controller, firmware should set this bit. This bit is auto-cleared after two AHB and two sdhost_clk_in clock cycles. (R/W)

Register 30.2. SDHOST_CLKDIV_REG (0x0008)

31	SDHOST_CLK_DIVIDER3	24	23	SDHOST_CLK_DIVIDER2	16	15	SDHOST_CLK_DIVIDER1	8	7	SDHOST_CLK_DIVIDER0	0
0x000		0x000		0x000		0x000		0x000		Reset	

SDHOST_CLK_DIVIDER m Clock divider (m) value. Clock divisor is 2^n , where $n = 0$ bypasses the divider (divisor of 1). For example, a value of 1 means divided by $2^1 = 2$, a value of 0xFF means divided by $2^{255} = 510$, and so on. The range of m is 0 ~ 3. (R/W)

Register 30.3. SDHOST_CLKSRC_REG (0x000C)

(reserved)										SDHOST_CLKSRC_REG				
31											4	3	0	
0x00000000										0x0				Reset

SDHOST_CLKSRC_REG Clock divider source for two SD cards is supported. Each card has two bits assigned to it. For example, bit[1:0] are assigned for card 0, bit[3:2] are assigned for card 1. Card 0 maps and internally routes clock divider[0:3] outputs to cclk_out[1:0] pins, depending on bit value. (R/W)

00 : Clock divider 0;
 01 : Clock divider 1;
 10 : Clock divider 2;
 11 : Clock divider 3.

Register 30.4. SDHOST_CLKENA_REG (0x0010)

(reserved)										SDHOST_LP_ENABLE				(reserved)				SDHOST_CCLK_ENABLE				
31											18	17	16	15					2	1	0	
0x0000										0x0				0x0000				0x0				Reset

SDHOST_LP_ENABLE Disable clock when the card is in IDLE state. One bit per card. (R/W)

0: clock disabled;
 1: clock enabled.

SDHOST_CCLK_ENABLE Clock-enable control for two SD card clocks and one MMC card clock is supported. One bit per card. (R/W)

0: Clock disabled;
 1: Clock enabled.

Register 30.5. SDHOST_TMOUT_REG (0x0014)

SDHOST_DATA_TIMEOUT										SDHOST_RESPONSE_TIMEOUT													
31																8	7						0
0xFFFFFFFF															0x40					Reset			

SDHOST_DATA_TIMEOUT Value for card data read timeout. This value is also used for data starvation by host timeout. The timeout counter is started only after the card clock is stopped. This value is specified in number of card output clocks, i.e. `sdhost_cclk_out` of the selected card. (R/W)
 NOTE: The software timer should be used if the timeout value is in the order of 100 ms. In this case, read data timeout interrupt needs to be disabled.

SDHOST_RESPONSE_TIMEOUT Response timeout value. Value is specified in terms of number of card output clocks, i.e., `sdhost_cclk_out`. (R/W)

Register 30.6. SDHOST_CTYPE_REG (0x0018)

(reserved)										SDHOST_CARD_WIDTH8										(reserved)										SDHOST_CARD_WIDTH4										
31																18	17	16	15						2	1						0								
0x0000															0x0					0x0000															0x0					Reset

SDHOST_CARD_WIDTH8 One bit per card indicates if card is in 8-bit mode. (R/W)
 0: Non 8-bit mode;
 1: 8-bit mode.
 Bit[17:16] correspond to card[1:0] respectively.

SDHOST_CARD_WIDTH4 One bit per card indicates if card is 1-bit or 4-bit mode. (R/W)
 0: 1-bit mode;
 1: 4-bit mode.
 Bit[1:0] correspond to card[1:0] respectively.

Register 30.7. SDHOST_BLKSIZE_REG (0x001C)

(reserved)										SDHOST_BLOCK_SIZE																																																																						
31											16	15											0																																																									
0										x										0										0										0										0										0										0x200										Reset

SDHOST_BLOCK_SIZE Block size. (R/W)

Register 30.8. SDHOST_BYTCNT_REG (0x0020)

31																																0
0x200																																Reset

SDHOST_BYTCNT_REG Number of bytes to be transferred, should be an integral multiple of Block Size for block transfers. For data transfers of undefined byte lengths, byte count should be set to 0. When byte count is set to 0, it is the responsibility of host to explicitly send stop/abort command to terminate data transfer. (R/W)

Register 30.9. SDHOST_INTMASK_REG (0x0024)

(reserved)	SDHOST_SDIO_INT_MASK	SDHOST_INT_MASK
31	18 17 16 15	0
0x0000	0x0	0x0000
Reset		

SDHOST_SDIO_INT_MASK SDIO interrupt mask, one bit for each card. Bit[17:16] correspond to card[15:0] respectively. When masked, SDIO interrupt detection for that card is disabled. 0 masks an interrupt, and 1 enables an interrupt. (R/W)

SDHOST_INT_MASK These bits used to mask unwanted interrupts. A value of 0 masks interrupt, and a value of 1 enables the interrupt. (R/W)

Bit 15 (EBE): End-bit error/no CRC error;

Bit 14 (ACD): Auto command done;

Bit 13 (SBE/BCI): Rx Start Bit Error;

Bit 12 (HLE): Hardware locked write error;

Bit 11 (FRUN): FIFO underrun/overflow error;

Bit 10 (HTO): Data starvation-by-host timeout;

Bit 9 (DRTO): Data read timeout;

Bit 8 (RTO): Response timeout;

Bit 7 (DCRC): Data CRC error;

Bit 6 (RCRC): Response CRC error;

Bit 5 (RXDR): Receive FIFO data request;

Bit 4 (TXDR): Transmit FIFO data request;

Bit 3 (DTO): Data transfer over;

Bit 2 (CD): Command done;

Bit 1 (RE): Response error;

Bit 0 (CD): Card detect.

Register 30.10. SDHOST_CMDARG_REG (0x0028)

31	0
0x00000000	
Reset	

SDHOST_CMDARG_REG Value indicates command argument to be passed to the card. (R/W)

Register 30.11. SDHOST_CMD_REG (0x002C)

31	30	29	28	27	26	25	24	23	22	21	20	16	15	14	13	12	11	10	9	8	7	6	5	0	
0	0	1	0	0	0	0	0	0	0	0	0	0x00	0	0	0	0	0	0	0	0	0	0	0	0x00	Reset

SDHOST_START_CMD Start command. Once command is served by the CIU, this bit is automatically cleared. When this bit is set, host should not attempt to write to any command registers. If a write is attempted, hardware lock error is set in raw interrupt register. Once command is sent and a response is received from SD_MMC_CEATA cards, Command Done bit is set in the raw interrupt Register. (R/W)

SDHOST_USE_HOLE Use Hold Register. (R/W)

- 0: CMD and DATA sent to card bypassing HOLD Register;
- 1: CMD and DATA sent to card through the HOLD Register.

SDHOST_CCS_EXPECTED Expected Command Completion Signal (CCS) configuration. (R/W)

- 0: Interrupts are not enabled in CE-ATA device ($nIEN = 1$ in ATA control register), or command does not expect CCS from device;
- 1: Interrupts are enabled in CE-ATA device ($nIEN = 0$), and RW_BLK command expects command completion signal from CE-ATA device.

If the command expects Command Completion Signal (CCS) from the CE-ATA device, the software should set this control bit. SD/MMC sets Data Transfer Over (DTO) bit in RINTSTS register and generates interrupt to host if Data Transfer Over interrupt is not masked.

SDHOST_READ_CEATA_DEVICE Read access flag. (R/W)

- 0: Host is not performing read access (RW_REG or RW_BLK) towards CE-ATA device;
- 1: Host is performing read access (RW_REG or RW_BLK) towards CE-ATA device.

Software should set this bit to indicate that CE-ATA device is being accessed for read transfer. This bit is used to disable read data timeout indication while performing CE-ATA read transfers. Maximum value of I/O transmission delay can be no less than 10 seconds. SD/MMC should not indicate read data timeout while waiting for data from CE-ATA device.

Continued on the next page...

Register 30.11. SDHOST_CMD_REG (0x002C)

Continued from the previous page...

SDHOST_UPDATE_CLOCK_REGISTERS_ONLY 0: Normal command sequence; 1: Do not send commands, just update clock register value into card clock domain. (R/W)

Following register values are transferred into card clock domain: CLKDIV, CLRSRC, and CLKENA. Changes card clocks (change frequency, truncate off or on, and set low-frequency mode). This is provided in order to change clock frequency or stop clock without having to send command to cards.

During normal command sequence, when `sdhost_update_clock_registers_only = 0`, following control registers are transferred from BIU to CIU: CMD, CMDARG, TMOUT, CTYPE, BLKSIZ, and BYTCNT. CIU uses new register values for new command sequence to card(s). When bit is set, there are no Command Done interrupts because no command is sent to SD_MMC_CEATA cards.

SDHOST_CARD_NUMBER Card number in use. Represents physical slot number of card being accessed. In SD-only mode, up to two cards are supported. (R/W)

SDHOST_SEND_INITIALIZATION 0: Do not send initialization sequence (80 clocks of 1) before sending this command; 1: Send initialization sequence before sending this command. (R/W)

After powered on, 80 clocks must be sent to card for initialization before sending any commands to card. Bit should be set while sending first command to card so that controller will initialize clocks before sending command to card.

SDHOST_STOP_ABORT_CMD 0: Neither stop nor abort command can stop current data transfer. If abort is sent to function-number currently selected or not in data-transfer mode, then bit should be set to 0; 1: Stop or abort command intended to stop current data transfer in progress. (R/W)

When open-ended or predefined data transfer is in progress, and host issues stop or abort command to stop data transfer, bit should be set so that command/data state-machines of CIU can return correctly to idle state.

SDHOST_WAIT_PRVDATA_COMPLETE 0: Send command at once, even if previous data transfer has not completed; 1: Wait for previous data transfer to complete before sending Command. (R/W)

The `SDHOST_WAIT_PRVDATA_COMPLETE = 0` option is typically used to query status of card during data transfer or to stop current data transfer. `SDHOST_CARD_NUMBERr` should be same as in previous command.

SDHOST_SEND_AUTO_STOP 0: No stop command is sent at the end of data transfer; 1: Send stop command at the end of data transfer. (R/W)

Continued on the next page...

Register 30.11. SDHOST_CMD_REG (0x002C)

Continued from the previous page ...

SDHOST_TRANSFER_MODE 0: Block data transfer command; 1: Stream data transfer command.
(R/W)

Don't care if no data expected.

SDHOST_READ_WRITE 0: Read from card; 1: Write to card.

Don't care if no data is expected from card. (R/W)

SDHOST_DATA_EXPECTED 0: No data transfer expected; 1: Data transfer expected. (R/W)

SDHOST_CHECK_RESPONSE_CRC 0: Do not check; 1: Check response CRC.

Some of command responses do not return valid CRC bits. Software should disable CRC checks for those commands in order to disable CRC checking by controller. (R/W)

SDHOST_RESPONSE_LENGTH 0: Short response expected from card; 1: Long response expected from card. (R/W)

SDHOST_RESPONSE_EXPECT 0: No response expected from card; 1: Response expected from card. (R/W)

SDHOST_CMD_INDEX Command index. (R/W)

Register 30.12. SDHOST_RESP0_REG (0x0030)

31	0
0x00000000	

Reset

SDHOST_RESP0_REG Bit[31:0] of response. (RO)

Register 30.13. SDHOST_RESP1_REG (0x0034)

31	0
0x00000000	

Reset

SDHOST_RESP1_REG Bit[63:32] of long response. (RO)

Register 30.14. SDHOST_RESP2_REG (0x0038)

31	0
0x00000000	

Reset

SDHOST_RESP2_REG Bit[95:64] of long response. (RO)

Register 30.15. SDHOST_RESP3_REG (0x003C)

31	0
0x00000000	
Reset	

SDHOST_RESP3_REG Bit[127:96] of long response. (RO)

Register 30.16. SDHOST_MINTSTS_REG (0x0040)

31	(reserved)	SDHOST_SDIO_INTERRUPT_MSK	SDHOST_INT_STATUS_MSK	0
18	17	16	15	0
0x0000		0x0	0x0000	
Reset				

SDHOST_SDIO_INTERRUPT_MSK Interrupt from SDIO card, one bit for each card. Bit[17:16] correspond to card1 and card0, respectively. SDIO interrupt for card is enabled only if corresponding sdhost_sdio_int_mask bit is set in Interrupt mask register (Setting mask bit enables interrupt). (RO)

SDHOST_INT_STATUS_MSK Interrupt enabled only if corresponding bit in interrupt mask register is set. (RO)

- Bit 15 (EBE): End-bit error/no CRC error;
- Bit 14 (ACD): Auto command done;
- Bit 13 (SBE/BCI): RX Start Bit Error;
- Bit 12 (HLE): Hardware locked write error;
- Bit 11 (FRUN): FIFO underrun/overflow error;
- Bit 10 (HTO): Data starvation by host timeout (HTO);
- Bit 9 (DTRO): Data read timeout;
- Bit 8 (RTO): Response timeout;
- Bit 7 (DCRC): Data CRC error;
- Bit 6 (RCRC): Response CRC error;
- Bit 5 (RXDR): Receive FIFO data request;
- Bit 4 (TXDR): Transmit FIFO data request;
- Bit 3 (DTO): Data transfer over;
- Bit 2 (CD): Command done;
- Bit 1 (RE): Response error;
- Bit 0 (CD): Card detect.

Register 30.17. SDHOST_RINTSTS_REG (0x0044)

(reserved)										SDHOST_SDIO_INTERRUPT_RAW					SDHOST_INT_STATUS_RAW					Reset				
31																		0						
0x0000																		0x0	0x0000					

SDHOST_SDIO_INTERRUPT_RAW Interrupt from SDIO card, one bit for each card. Bit[17:16] correspond to card1 and card0, respectively. Setting a bit clears the corresponding interrupt bit and writing 0 has no effect. (R/W)

- 0: No SDIO interrupt from card;
- 1: SDIO interrupt from card.

SDHOST_INT_STATUS_RAW Setting a bit clears the corresponding interrupt and writing 0 has no effect. Bits are logged regardless of interrupt mask status. (R/W)

- Bit 15 (EBE): End-bit error/no CRC error;
- Bit 14 (ACD): Auto command done;
- Bit 13 (SBE/BCI): RX Start Bit Error;
- Bit 12 (HLE): Hardware locked write error;
- Bit 11 (FRUN): FIFO underrun/overrun error;
- Bit 10 (HTO): Data starvation by host timeout (HTO);
- Bit 9 (DTRO): Data read timeout;
- Bit 8 (RTO): Response timeout;
- Bit 7 (DCRC): Data CRC error;
- Bit 6 (RCRC): Response CRC error;
- Bit 5 (RXDR): Receive FIFO data request;
- Bit 4 (TXDR): Transmit FIFO data request;
- Bit 3 (DTO): Data transfer over;
- Bit 2 (CD): Command done;
- Bit 1 (RE): Response error;
- Bit 0 (CD): Card detect.

Register 30.18. SDHOST_STATUS_REG (0x0048)

(reserved)		SDHOST_FIFO_COUNT					SDHOST_RESPONSE_INDEX			SDHOST_DATA_STATE_MC_BUSY			SDHOST_COMMAND_FSM_STATES			SDHOST_FIFO_FULL		SDHOST_FIFO_EMPTY		SDHOST_FIFO_TX_WATERMARK		SDHOST_FIFO_RX_WATERMARK	
31	30	29	17	16	11	10	9	8	7	4	3	2	1	0									
0	0	0x000					0x00			1	1	1	0x1			0	1	1	0				

Reset

SDHOST_FIFO_COUNT FIFO count, number of filled locations in FIFO. (RO)

SDHOST_RESPONSE_INDEX Index of previous response, including any auto-stop sent by core. (RO)

SDHOST_DATA_STATE_MC_BUSY Data transmit or receive state-machine is busy. (RO)

SDHOST_DATA_BUSY Inverted version of raw selected sdhost_card_data[0].

0: Card data not busy;

1: Card data busy. (RO)

SDHOST_DATA_3_STATUS Raw selected sdhost_card_data[3], checks whether card is present.

0: card not present;

1: card present. (RO)

SDHOST_COMMAND_FSM_STATES Command FSM states. (RO)

0: Idle;

1: Send init sequence;

2: Send cmd start bit;

3: Send cmd tx bit;

4: Send cmd index + arg;

5: Send cmd crc7;

6: Send cmd end bit;

7: Receive resp start bit;

8: Receive resp IRQ response;

9: Receive resp tx bit;

10: Receive resp cmd idx;

11: Receive resp data;

12: Receive resp crc7;

13: Receive resp end bit;

14: Cmd path wait NCC;

15: Wait, cmd-to-response turnaround.

Register 30.18. SDHOST_STATUS_REG (0x0048)

Continued from the previous page ...

SDHOST_FIFO_FULL FIFO is full status. (RO)

SDHOST_FIFO_EMPTY FIFO is empty status. (RO)

SDHOST_FIFO_TX_WATERMARK FIFO reached Transmit watermark level, not qualified with data transfer. (RO)

SDHOST_FIFO_RX_WATERMARK FIFO reached Receive watermark level, not qualified with data transfer. (RO)

PRELIMINARY

Register 30.19. SDHOST_FIFOTH_REG (0x004C)

(reserved)		SDHOST_DMA_MULTIPLE_TRANSACTION_SIZE						(reserved)			SDHOST_RX_WMARK			(reserved)			SDHOST_TX_WMARK			0
31	30	28	27	26	16	15	12	11	0											
0	0x0	0	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0x000	Reset

SDHOST_DMA_MULTIPLE_TRANSACTION_SIZE Burst size of multiple transaction, should be programmed same as DMA controller multiple-transaction-size SDHOST_SRC/DEST_MSIZ. (R/W)

000: 1-byte transfer;
 001: 4-byte transfer;
 010: 8-byte transfer;
 011: 16-byte transfer;
 100: 32-byte transfer;
 101: 64-byte transfer;
 110: 128-byte transfer;
 111: 256-byte transfer.

SDHOST_RX_WMARK FIFO threshold watermark level when receiving data to card. When FIFO data count reaches greater than this number, DMA/FIFO request is raised. During end of packet, request is generated regardless of threshold programming in order to complete any remaining data. In non-DMA mode, when receiver FIFO threshold (RXDR) interrupt is enabled, then interrupt is generated instead of DMA request. During end of packet, interrupt is not generated if threshold programming is larger than any remaining data. It is responsibility of host to read remaining bytes on seeing Data Transfer Done interrupt. In DMA mode, at end of packet, even if remaining bytes are less than threshold, DMA request does single transfers to flush out any remaining bytes before Data Transfer Done interrupt is set. (R/W)

SDHOST_TX_WMARK FIFO threshold watermark level when transmitting data to card. When FIFO data count is less than or equal to this number, DMA/FIFO request is raised. If Interrupt is enabled, then interrupt occurs. During end of packet, request or interrupt is generated, regardless of threshold programming. In non-DMA mode, when transmit FIFO threshold (TXDR) interrupt is enabled, then interrupt is generated instead of DMA request. During end of packet, on last interrupt, host is responsible for filling FIFO with only required remaining bytes (not before FIFO is full or after CIU completes data transfers, because FIFO may not be empty). In DMA mode, at end of packet, if last transfer is less than burst size, DMA controller does single cycles until required bytes are transferred. (R/W)

Register 30.20. SDHOST_CDETECT_REG (0x0050)

31	(reserved)	2	1	0	
0x0000000				0x0	Reset

SDHOST_CARD_DETECT_N Value on sdhost_card_detect_n input ports (1 bit per card), read-only bits. 0 represents presence of card. Only NUM_CARDS number of bits are implemented. (RO)

Register 30.21. SDHOST_WRTprt_REG (0x0054)

31	(reserved)	2	1	0	
0x0000000				0x0	Reset

SDHOST_WRITE_PROTECT Value on sdhost_card_write_prt input ports (1 bit per card). 1 represents write protection. Only NUM_CARDS number of bits are implemented. (RO)

Register 30.22. SDHOST_TCBCNT_REG (0x005C)

31				0	
0x0000000					Reset

SDHOST_TCBCNT_REG Number of bytes transferred by CIU unit to card. (RO)

Register 30.23. SDHOST_TBBCNT_REG (0x0060)

31				0	
0x0000000					Reset

SDHOST_TBBCNT_REG Number of bytes transferred between Host/DMA memory and BIU FIFO. (RO)

Register 30.24. SDHOST_DEBNCE_REG (0x0064)

(reserved)	SDHOST_DEBOUNCE_COUNT
31	24 23 0
0 0 0 0 0 0 0 0 0	0x000000
Reset	

SDHOST_DEBOUNCE_COUNT Number of host clocks (clk) used by debounce filter logic. The typical debounce time is 5 ~ 25 ms to prevent the card instability when the card is inserted or removed. (R/W)

Register 30.25. SDHOST_USRID_REG (0x0068)

31	0
0x00000000	
Reset	

SDHOST_USRID_REG User identification register, value set by user. Can also be used as a scratch-pad register by user. (R/W)

Register 30.26. SDHOST_VERID_REG (0x006C)

31	0
0x5432270A	
Reset	

SDHOST_VERSIONID_REG Hardware version register. Can also be read by firmware. (RO)

Register 30.27. SDHOST_HCON_REG (0x0070)

SDHOST_NUM_CLK_DIV_REG Have 4 clk divider in design . (RO)

SDHOST_HOLD_REG Have a hold register in data path . (RO)

SDHOST_RAM_INDISE_REG Inside RAM in SDMMC module. (RO)

SDHOST_DMA_WIDTH_REG DMA data width is 32. (RO)

SDHOST_ADDR_WIDTH_REG Register address width is 32. (RO)

SDHOST_DATA_WIDTH_REG Register data width is 32. (RO)

SDHOST_BUS_TYPE_REG Register config is APB bus. (RO)

SDHOST_CARD_NUM_REG Support card number is 2. (RO)

SDHOST_CARD_TYPE_REG Hardware support SDIO and MMC. (RO)

Register 30.28. SDHOST_UHS_REG (0x0074)

reserved												SDHOST_DDR_REG				reserved											
31	18	17	16	15	0																						
0x0000				0x0				0x0000																			

SDHOST_DDR_REG DDR mode selecton, 1 bit for each card. (R/W)

0-Non-DDR mode.

1-DDR mode.

Register 30.29. SDHOST_RST_N_REG (0x0078)

31	(reserved)	2	1	0	SDHOST_RST_CARD_RESET
0x00000000				0x1	Reset

SDHOST_RST_CARD_RESET Hardware reset.

1: Active mode;

0: Reset.

These bits cause the cards to enter pre-idle state, which requires them to be re-initialized. SDHOST_RST_CARD_RESET[0] should be set to 1'b0 to reset card0, SDHOST_RST_CARD_RESET[1] should be set to 1'b0 to reset card1. (R/W)

Register 30.32. SDHOST_DBADDR_REG (0x0088)

31	0
0x00000000	
Reset	

SDHOST_DBADDR_REG Start of Descriptor List. Contains the base address of the First Descriptor. The LSB bits [1:0] are ignored and taken as all-zero by the IDMAC internally. Hence these LSB bits may be treated as read-only. (R/W)

PRELIMINARY

Register 30.33. SDHOST_IDSTS_REG (0x008C)

Continued from the previous page...

SDHOST_IDSTS_CES Card Error Summary. Indicates the status of the transaction to/from the card, also present in RINTSTS. Indicates the logical OR of the following bits: (R/W)

EBE : End Bit Error;

RTO : Response Timeout/Boot Ack Timeout;

RCRC : Response CRC;

SBE : Start Bit Error;

DRTO : Data Read Timeout/BDS timeout;

DCRC : Data CRC for Receive;

RE : Response Error.

Writing 1 clears this bit. The abort condition of the IDMAC depends on the setting of this CES bit. If the CES bit is enabled, then the IDMAC aborts on a response error.

SDHOST_IDSTS_DU Descriptor Unavailable Interrupt. This bit is set when the descriptor is unavailable due to OWNER bit = 0 (DESO[31] = 0). Writing 1 clears this bit. (R/W)

SDHOST_IDSTS_FBE Fatal Bus Error Interrupt. Indicates that a Bus Error occurred (IDSTS[12:10]). When this bit is set, the DMA disables all its bus accesses. Writing 1 clears this bit. (R/W)

SDHOST_IDSTS_RI Receive Interrupt. Indicates the completion of data reception for a descriptor. Writing 1 clears this bit. (R/W)

SDHOST_IDSTS_TI Transmit Interrupt. Indicates that data transmission is finished for a descriptor. Writing 1 clears this bit. (R/W)

Register 30.36. SDHOST_BUFADDR_REG (0x0098)

31	0
0x00000000	
Reset	

SDHOST_BUFADDR_REG Host Buffer Address Pointer, updated by IDMAC during operation and cleared on reset. This register points to the current Data Buffer Address being accessed by the IDMAC. (RO)

Register 30.37. SDHOST_CARDTHRCTL_REG (0x0100)

31	16	15	3	2	1	0
0x000		(reserved)			0x00	
					0	0
					0	0
Reset						

SDHOST_CARDTHRESHOLD_REG The inside FIFO size is 512, This register is applicable when SDHOST_CARDERTHREN_REG is set to 1 or SDHOST_CARDRDTHREN_REG set to 1. (R/W)

SDHOST_CARDWRTHREN_REG Applicable when HS400 mode is enabled. (R/W)

1'b0-Card write Threshold disabled.

1'b1-Card write Threshold enabled.

SDHOST_CARDCLRINTEN_REG Busy clear interrupt generation: (R/W)

1'b0-Busy clear interrupt disabled.

1'b1-Busy clear interrupt enabled.

SDHOST_CARDRDTHREN_REG Card read threshold enable. (R/W)

1'b0-Card read threshold disabled.

1'b1-Card read threshold enabled.

Register 30.38. SDHOST_EMMC_DDR_REG (0x010C)

31	30	(reserved)	2	1	0
0x0			0x000000		
					0x0
					Reset

SDHOST_HS400_MODE_REG Set 1 to enable HS400 mode. (R/W)

SDHOST_HALFSTARTBIT_REG Control for start bit detection mechanism duration of start bit. Each bit refers to one slot. Set this bit to 1 for eMMC4.5 and above, set to 0 for SD applications. For eMMC4.5, start bit can be: (R/W)

1'b0-Full cycle.

1'b1-less than one full cycle.

Register 30.39. SDHOST_ENSHIFT_REG (0x0110)

31	4	3	0
0x00000000		0x0	
			Reset

DHOST_ENABLE_SHIFT_REG Control for the amount of phase shift provided on the default enables in the design. Two bits assigned for each card. (R/W)

2'b00-Default phase shift.

2'b01-Enables shifted to next immediate positive edge.

2'b10-Enables shifted to next immediate negative edge.

2'b11-Reserved.

Register 30.40. SDHOST_BUFFIFO_REG (0x0200)

31	0
0x00000000	
Reset	

SDHOST_BUFFIFO_REG CPU write and read transmit data by FIFO. This register points to the current Data FIFO. (RO)

Register 30.41. SDHOST_CLK_DIV_EDGE_REG (0x0800)

(reserved)		(SDHOST_CLK_SOURCE_REG)		(reserved)		SDHOST_CCLKIN_EDGE_N		SDHOST_CCLKIN_EDGE_L		SDHOST_CCLKIN_EDGE_H		SDHOST_CCLKIN_EDGE_SLF_SEL		SDHOST_CCLKIN_EDGE_SAM_SEL		SDHOST_CCLKIN_EDGE_DRV_SEL	
32	24	23	22	21	20	17	16	13	12	9	8	6	5	3	2	0	
0x000		0x0	0x0	0x1		0x0		0x1		0x0		0x0		0x0		Reset	

SDHOST_CLK_SOURCE_REG Set to 1 to use 160M PLL clock ,Set to 0 to use 40M XLTAL clock.
(R/W)

CCLKIN_EDGE_N This value should be equal to CCLKIN_EDGE_L. (R/W)

CCLKIN_EDGE_L The low level of the divider clock. The value should be larger than CCLKIN_EDGE_H. (R/W)

CCLKIN_EDGE_H The high level of the divider clock. The value should be smaller than CCLKIN_EDGE_L. (R/W)

CCLKIN_EDGE_SLF_SEL It is used to select the clock phase of the internal signal from phase90, phase180, or phase270. (R/W)

CCLKIN_EDGE_SAM_SEL It is used to select the clock phase of the input signal from phase90, phase180, or phase270. (R/W)

CCLKIN_EDGE_DRV_SEL It is used to select the clock phase of the output signal from phase90, phase180, or phase270. (R/W)

Note: SD/MMC use this register to divide the 160M clock(CCLKIN_EDGE_H/CCLKIN_EDGE_L). The output clock connect to sdio slave divider by this register and SDHOST_CLKDIV_REG,there are 4 clock source to selected by SDHOST_CLKSRC_REG register.

31 LED PWM Controller (LEDC)

31.1 Overview

The LED PWM Controller is a peripheral designed to generate PWM signals for LED control. It has specialized features such as automatic duty cycle fading. However, the LED PWM Controller can also be used to generate PWM signals for other purposes.

31.2 Features

The LED PWM Controller has the following features:

- Eight independent PWM generators (i.e. eight channels)
- Four independent timers that support division by fractions
- Automatic duty cycle fading (i.e. gradual increase/decrease of a PWM's duty cycle without interference from the processors) with interrupt generation on fade completion
- Adjustable phase of PWM signal output
- PWM signal output in low-power mode (Light-sleep mode)
- Maximum PWM resolution: 14 bits

Note that the four timers are identical regarding their features and operation. The following sections refer to the timers collectively as Timer x (where x ranges from 0 to 3). Likewise, the eight PWM generators are also identical in features and operation, and thus are collectively referred to as PWM n (where n ranges from 0 to 7).

Figure 31-1. LED PWM Architecture

31.3 Functional Description

31.3.1 Architecture

Figure 31-1 shows the architecture of the LED PWM Controller.

The four timers can be independently configured (i.e. clock divider, and counter overflow value) and each internally maintains a timebase counter (i.e. a counter that counts on cycles of a reference clock). Each PWM

generator will select one of the timers and uses the timer's counter value as a reference to generate its PWM signal.

Figure 31-2 illustrates the main functional blocks of the timer and the PWM generator.

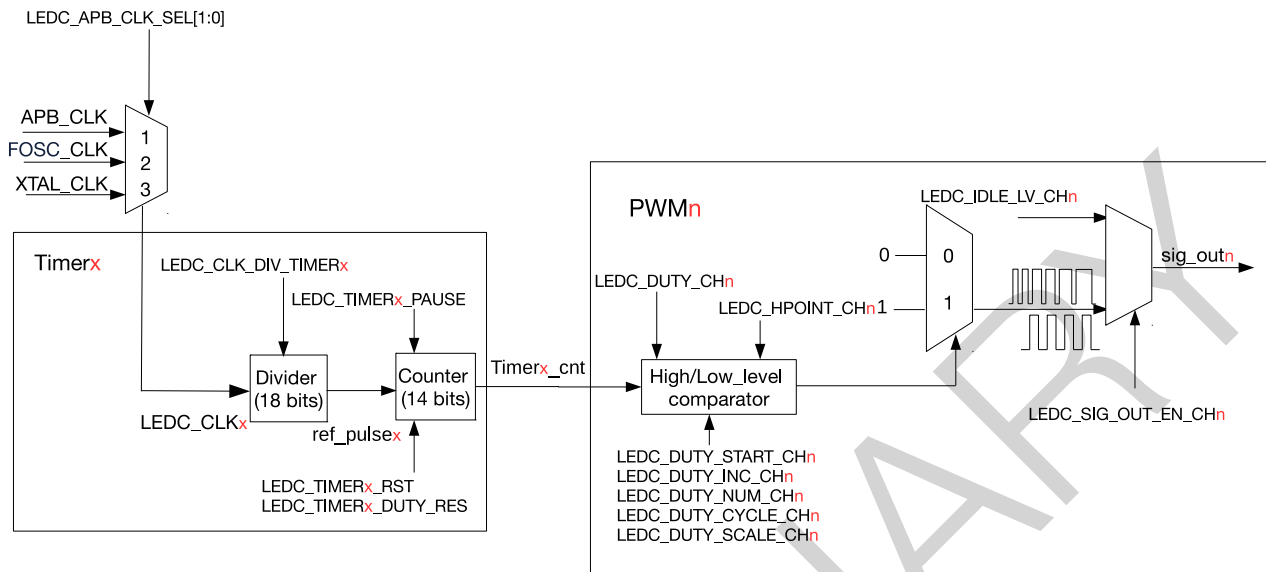

Figure 31-2. LED PWM Generator Diagram

31.3.2 Timers

Each timer in LED PWM Controller internally maintains a timebase counter. Referring to Figure 31-2, this clock signal used by the timebase counter is named `ref_pulsex`. All timers use the same clock source `LEDC_CLKx`, which is then passed through a clock divider to generate `ref_pulsex` for the counter.

31.3.2.1 Clock Source

Software configuring registers for LED PWM is clocked by `APB_CLK`. For more information about `APB_CLK`, see Chapter 6 *Reset and Clock*. To use the LED PWM peripheral, the `APB_CLK` signal to the LED PWM has to be enabled. The `APB_CLK` signal to LED PWM can be enabled by setting the `SYSTEM_LEDC_CLK_EN` field in the register `SYSTEM_PERIP_CLK_EN0_REG` and be reset via software by setting the `SYSTEM_LEDC_RST` field in the register `SYSTEM_PERIP_RST_EN0_REG`. For more information, please refer to Table 15-1 in Chapter 15 *System Registers*.

Timers in the LED PWM Controller choose their common clock source from one of the following clock signals: `APB_CLK`, `FOSC_CLK` and `XTAL_CLK` (see Chapter 6 *Reset and Clock* for more details about each clock signal). The procedure for selecting a clock source signal for `LEDC_CLKx` is described below:

- `APB_CLK`: Set `LEDC_APB_CLK_SEL[1:0]` to 1
- `FOSC_CLK`: Set `LEDC_APB_CLK_SEL[1:0]` to 2
- `XTAL_CLK`: Set `LEDC_APB_CLK_SEL[1:0]` to 3

The `LEDC_CLKx` signal will then be passed through the clock divider.

31.3.2.2 Clock Divider Configuration

The LEDC_CLK_x signal is passed through a clock divider to generate the ref_pulse_x signal for the counter. The frequency of ref_pulse_x is equal to the frequency of LEDC_CLK_x divided by the LEDC_CLK_DIV_TIMER_x divider value (see Figure 31-2).

The LEDC_CLK_DIV_TIMER_x divider value is a fractional clock divider. Thus, it supports non-integer divider values. LEDC_CLK_DIV_TIMER_x is configured according to the following equation.

$$\text{LEDC_CLK_DIV_TIMER}_x = A + \frac{B}{256}$$

- A corresponds to the most significant 10 bits of LEDC_CLK_DIV_TIMER_x (i.e. LEDC_TIMER_x_CONF_REG[21:12])
- The fractional part B corresponds to the least significant 8 bits of LEDC_CLK_DIV_TIMER_x (i.e. LEDC_TIMER_x_CONF_REG[11:4])

When the fractional part B is zero, LEDC_CLK_DIV_TIMER_x is equivalent to an integer divider value (i.e. an integer prescaler). In other words, a ref_pulse_x clock pulse is generated after every A number of LEDC_CLK_x clock pulses.

However, when B is nonzero, LEDC_CLK_DIV_TIMER_x becomes a non-integer divider value. The clock divider implements non-integer frequency division by alternating between A and $(A+1)$ LEDC_CLK_x clock pulses per ref_pulse_x clock pulse. This will result in the average frequency of ref_pulse_x clock pulse being the desired frequency (i.e. the non-integer divided frequency). For every 256 ref_pulse_x clock pulses:

- A number of B ref_pulse_x clock pulses will consist of $(A+1)$ LEDC_CLK_x clock pulses
- A number of $(256-B)$ ref_pulse_x clock pulses will consist of A LEDC_CLK_x clock pulses
- The ref_pulse_x clock pulses consisting of $(A+1)$ pulses are evenly distributed amongst those consisting of A pulses

Figure 31-3 illustrates the relation between LEDC_CLK_x clock pulses and ref_pulse_x clock pulses when dividing by a non-integer LEDC_CLK_DIV_TIMER_x.

Figure 31-3. Frequency Division When LEDC_CLK_DIV_TIMER_x is a Non-Integer Value

To change the timer's clock divider value at runtime, first set the LEDC_CLK_DIV_TIMER_x field, and then set the LEDC_TIMER_x_PARA_UP field to apply the new configuration. This will cause the newly configured values to take effect upon the next overflow of the counter. LEDC_TIMER_x_PARA_UP field will be automatically cleared by hardware.

31.3.2.3 14-bit Counter

Each timer contains a 14-bit timebase counter that uses `ref_pulsex` as its reference clock (see Figure 31-2). The `LEDC_TIMERx_DUTY_RES` field configures the overflow value of this 14-bit counter. Hence, the maximum resolution of the PWM signal is 14 bits. The counter counts up to $2^{\text{LEDC_TIMER}_x\text{_DUTY_RES}} - 1$, overflows and begins counting from 0 again. The counter's value can be read, reset, and suspended by software.

The counter can trigger `LEDC_TIMERx_OVF_INT` interrupt (generated automatically by hardware without configuration) every time the counter overflows. It can also be configured to trigger `LEDC_OVF_CNT_CHn_INT` interrupt after the counter overflows `LEDC_OVF_NUM_CHn + 1` times. To configure `LEDC_OVF_CNT_CHn_INT` interrupt, please:

1. Configure `LEDC_TIMER_SEL_CHn` as the counter for the PWM generator
2. Enable the counter by setting `LEDC_OVF_CNT_EN_CHn`
3. Set `LEDC_OVF_NUM_CHn` to the number of counter overflows to generate an interrupt, minus 1
4. Enable the overflow interrupt by setting `LEDC_OVF_CNT_CHn_INT_ENA`
5. Set `LEDC_TIMERx_DUTY_RES` to enable the timer and wait for a `LEDC_OVF_CNT_CHn_INT` interrupt

Referring to Figure 31-2, the frequency of a PWM generator output signal (`sig_outn`) is dependent on the frequency of the timer's clock source (`LEDC_CLKx`), the clock divider value (`LEDC_CLK_DIV_TIMERx`), and the range of the counter (`LEDC_TIMERx_DUTY_RES`):

$$f_{\text{PWM}} = \frac{f_{\text{LEDC_CLK}_x}}{\text{LEDC_CLK_DIV_TIMER}_x \cdot 2^{\text{LEDC_TIMER}_x\text{_DUTY_RES}}}$$

To change the overflow value at runtime, first set the `LEDC_TIMERx_DUTY_RES` field, and then set the `LEDC_TIMERx_PARA_UP` field. This will cause the newly configured values to take effect upon the next overflow of the counter. If `LEDC_OVF_CNT_EN_CHn` field is reconfigured, `LEDC_PARA_UP_CHn` should be set to apply the new configuration. In summary, these configuration values need to be updated by setting `LEDC_TIMERx_PARA_UP` or `LEDC_PARA_UP_CHn`. `LEDC_TIMERx_PARA_UP` and `LEDC_PARA_UP_CHn` will be automatically cleared by hardware.

31.3.3 PWM Generators

To generate a PWM signal, a PWM generator (`PWMn`) selects a timer (`Timerx`). Each PWM generator can be configured separately by setting `LEDC_TIMER_SEL_CHn` to use one of four timers to generate the PWM output.

As shown in Figure 31-2, each PWM generator has a comparator and two multiplexers. A PWM generator compares the timer's 14-bit counter value (`Timerx_cnt`) to two trigger values `Hpointn` and `Lpointn`. When the timer's counter value is equal to `Hpointn` or `Lpointn`, the PWM signal is high or low, respectively, as described below:

- If `Timerx_cnt == Hpointn`, `sig_outn` is 1.
- If `Timerx_cnt == Lpointn`, `sig_outn` is 0.

Figure 31-4 illustrates how `Hpointn` or `Lpointn` are used to generate a fixed duty cycle PWM output signal.

For a particular PWM generator (`PWMn`), its `Hpointn` is sampled from the `LEDC_HPOINT_CHn` field each time the selected timer's counter overflows. Likewise, `Lpointn` is also sampled on every counter overflow and is calculated

Figure 31-4. LED_PWM Output Signal Diagram

from the sum of the `LEDC_DUTY_CHn[18:4]` and `LEDC_HPOINT_CHn` fields. By setting `Hpointn` and `Lpointn` via the `LEDC_HPOINT_CHn` and `LEDC_DUTY_CHn[18:4]` fields, the relative phase and duty cycle of the PWM output can be set.

The PWM output signal (`sig_outn`) is enabled by setting `LEDC_SIG_OUT_EN_CHn`. When `LEDC_SIG_OUT_EN_CHn` is cleared, PWM signal output is disabled, and the output signal (`sig_outn`) will output a constant level as specified by `LEDC_IDLE_LV_CHn`.

The bits `LEDC_DUTY_CHn[3:0]` are used to dither the duty cycles of the PWM output signal (`sig_outn`) by periodically altering the duty cycle of `sig_outn`. When `LEDC_DUTY_CHn[3:0]` is set to a non-zero value, then for every 16 cycles of `sig_outn`, `LEDC_DUTY_CHn[3:0]` of those cycles will have PWM pulses that are one timer tick longer than the other ($16 - \text{LEDC_DUTY_CHn}[3:0]$) cycles. For instance, if `LEDC_DUTY_CHn[18:4]` is set to 10 and `LEDC_DUTY_CHn[3:0]` is set to 5, then 5 of 16 cycles will have a PWM pulse with a duty value of 11 and the rest of the 16 cycles will have a PWM pulse with a duty value of 10. The average duty cycle after 16 cycles is 10.3125.

If fields `LEDC_TIMER_SEL_CHn`, `LEDC_HPOINT_CHn`, `LEDC_DUTY_CHn[18:4]` and `LEDC_SIG_OUT_EN_CHn` are reconfigured, `LEDC_PARA_UP_CHn` must be set to apply the new configuration. This will cause the newly configured values to take effect upon the next overflow of the counter. `LEDC_PARA_UP_CHn` field will be automatically cleared by hardware.

31.3.4 Duty Cycle Fading

The PWM generators can fade the duty cycle of a PWM output signal (i.e. gradually change the duty cycle from one value to another). If Duty Cycle Fading is enabled, the value of `Lpointn` will be incremented/decremented after a fixed number of counter overflows occurs. Figure 31-5 illustrates Duty Cycle Fading.

Figure 31-5. Output Signal Diagram of Fading Duty Cycle

Duty Cycle Fading is configured using the following register fields:

- `LEDC_DUTY_CHn` is used to set the initial value of `Lpointn`.

- `LEDC_DUTY_START_CH n` will enable/disable duty cycle fading when set/cleared.
- `LEDC_DUTY_CYCLE_CH n` sets the number of counter overflow cycles for every `Lpoint n` increment/decrement. In other words, `Lpoint n` will be incremented/decremented after `LEDC_DUTY_CYCLE_CH n` counter overflows.
- `LEDC_DUTY_INC_CH n` configures whether `Lpoint n` is incremented/decremented if set/cleared.
- `LEDC_DUTY_SCALE_CH n` sets the amount that `Lpoint n` is incremented/decremented.
- `LEDC_DUTY_NUM_CH n` sets the maximum number of increments/decrements before duty cycle fading stops.

If the fields `LEDC_DUTY_CH n` , `LEDC_DUTY_START_CH n` , `LEDC_DUTY_CYCLE_CH n` , `LEDC_DUTY_INC_CH n` , `LEDC_DUTY_SCALE_CH n` , and `LEDC_DUTY_NUM_CH n` are reconfigured, `LEDC_PARA_UP_CH n` must be set to apply the new configuration. After this field is set, the values for duty cycle fading will take effect at once. `LEDC_PARA_UP_CH n` field will be automatically cleared by hardware.

31.3.5 Interrupts

- `LEDC_OVF_CNT_CH n _INT`: Triggered when the timer counter overflows for $(LEDC_OVF_NUM_CH n + 1)$ times and the register `LEDC_OVF_CNT_EN_CH n` is set to 1.
- `LEDC_DUTY_CHNG_END_CH n _INT`: Triggered when a fade on an LED PWM generator has finished.
- `LEDC_TIMER x _OVF_INT`: Triggered when an LED PWM timer has reached its maximum counter value.

31.4 Register Summary

The addresses in this section are relative to **LED PWM Controller** base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
Configuration Register

LEDC_TIMER_SEL_CH n This field is used to select one of timers for channel n .

- 0: select timer0
- 1: select timer1
- 2: select timer2
- 3: select timer3 (R/W)

LEDC_SIG_OUT_EN_CH n Set this bit to enable signal output on channel n . (R/W)

LEDC_IDLE_LV_CH n This bit is used to control the output value when channel n is inactive (when LEDC_SIG_OUT_EN_CH n is 0). (R/W)

LEDC_PARA_UP_CH n This bit is used to update the listed fields below for channel n , and will be automatically cleared by hardware. (WO)

- LEDC_HPOINT_CH n
- LEDC_DUTY_START_CH n
- LEDC_SIG_OUT_EN_CH n
- LEDC_TIMER_SEL_CH n
- LEDC_DUTY_NUM_CH n
- LEDC_DUTY_CYCLE_CH n
- LEDC_DUTY_SCALE_CH n
- LEDC_DUTY_INC_CH n
- LEDC_OVF_CNT_EN_CH n

Continued on the next page...

Register 31.1. LEDC_CH n _CONF0_REG (n : 0-7) (0x0000+0x14* n)

Continued from the previous page...

LEDC_OVF_NUM_CH n This register is used to configure the maximum times of overflow minus 1. The LEDC_OVF_CNT_CH n _INT interrupt will be triggered when channel n overflows for (LEDC_OVF_NUM_CH n + 1) times. (R/W)

LEDC_OVF_CNT_EN_CH n This bit is used to count the number of times when the timer selected by channel n overflows.(R/W)

LEDC_OVF_CNT_RESET_CH n Set this bit to reset the timer-overflow counter of channel n . (WO)

LEDC_OVF_CNT_RESET_ST_CH n This is the status bit of LEDC_OVF_CNT_RESET_CH n . (RO)

Register 31.2. LEDC_CH n _CONF1_REG (n : 0-7) (0x000C+0x14* n)

LEDC_DUTY_START_CH n LEDC_DUTY_INC_CH n		LEDC_DUTY_NUM_CH n		LEDC_DUTY_CYCLE_CH n		LEDC_DUTY_SCALE_CH n	
31	30	29	20	19	10	9	0
0	1	0x0		0x0		0x0	
							Reset

LEDC_DUTY_SCALE_CH n This register is used to configure the changing step scale of duty on channel n . (R/W)

LEDC_DUTY_CYCLE_CH n The duty will change every LEDC_DUTY_CYCLE_CH n on channel n . (R/W)

LEDC_DUTY_NUM_CH n This register is used to control the number of times the duty cycle will be changed. (R/W)

LEDC_DUTY_INC_CH n This register is used to increase or decrease the duty of output signal on channel n . 1: Increase; 0: Decrease. (R/W)

LEDC_DUTY_START_CH n Other configured fields in LEDC_CH n _CONF1_REG will start to take effect upon the next timer overflow when this bit is set to 1. (R/W)

Register 31.13. LEDC_DATE_REG (0x00FC)

LEDC_DATE	
31	0
0x19072601	
Reset	

LEDC_DATE This is the version control register. (R/W)

PRELIMINARY

32 Motor Control PWM (MCPWM)

32.1 Overview

The **M**otor **C**ontrol **P**ulse **W**idth **M**odulator (MCPWM) peripheral is intended for motor and power control. It provides six PWM outputs that can be set up to operate in several topologies. One common topology uses a pair of PWM outputs driving an H-bridge to control motor rotation speed and rotation direction.

The timing and control resources inside are allocated into two major types of submodules: PWM timers and PWM operators. Each PWM timer provides timing references that can either run freely or be synced to other timers or external sources. Each PWM operator has all necessary control resources to generate waveform pairs for one PWM channel. The MCPWM peripheral also contains a dedicated capture submodule that is used in systems where accurate timing of external events is important.

ESP32-S3 contains two MCPWM peripherals: MCPWM0 and MCPWM1.

32.2 Features

Each MCPWM peripheral has one clock divider (prescaler), three PWM timers, three PWM operators, and a capture module. Figure 32-1 shows the submodules inside and the signals on the interface. PWM timers are used for generating timing references. The PWM operators generate desired waveform based on the timing references. Any PWM operator can be configured to use the timing references of any PWM timers. Different PWM operators can use the same PWM timer's timing references to produce related PWM signals. PWM operators can also use different PWM timers' values to produce the PWM signals that work alone. Different PWM timers can also be synchronized together.

Figure 32-1. MCPWM Module Overview

An overview of the submodules' function in Figure 32-1 is shown below:

- PWM Timers 0, 1 and 2
 - Every PWM timer has a dedicated 8-bit clock prescaler.
 - The 16-bit counter in the PWM timer can work in count-up mode, count-down mode or count-up-down mode.
 - A hardware sync or software sync can trigger a reload on the PWM timer with a phase register. It will also trigger the prescaler's restart, so that the timer's clock can also be synced. The source of the hard sync can come from any GPIO or any other PWM timer's sync_out. The source of the soft sync comes from writing toggle value to the `MCPWM_TIMERx_SYNC_SW` bit.
- PWM Operators 0, 1 and 2
 - Every PWM operator has two PWM outputs: PWMxA and PWMxB. They can work independently, in symmetric and asymmetric configuration.
 - Software, asynchronously override control of PWM signals.
 - Configurable dead-time on rising and falling edges; each set up independently.
 - All events can trigger CPU interrupts.
 - Modulating of PWM output by high-frequency carrier signals, useful when gate drivers are insulated with a transformer.
 - Period, time stamps and important control registers have shadow registers with flexible updating methods.
- Fault Detection Module
 - Programmable fault handling allocated on fault condition in both cycle-by-cycle mode and one-shot mode.
 - A fault condition can force the PWM output to either high or low logic levels.
- Capture Module
 - Speed measurement of rotating machinery (for example, toothed sprockets sensed with Hall sensors)
 - Measurement of elapsed time between position sensor pulses
 - Period and duty-cycle measurement of pulse train signals
 - Decoding current or voltage amplitude derived from duty-cycle-encoded signals of current/voltage sensors
 - Three individual capture channels, each of which has a time-stamp register (32 bits)
 - Selection of edge polarity and prescaling of input capture signal
 - The capture timer can sync with a PWM timer or external signals.
 - Interrupt on each of the three capture channels

32.3 Submodules

32.3.1 Overview

This section lists the configuration parameters of key submodules. For information on adjusting a specific parameter, e.g. synchronization source of PWM timer, please refer to Section 32.3.2 for details.

32.3.1.1 Prescaler Submodule

Figure 32-2. Prescaler Submodule

Configuration option:

- Scale the CRYPTO_PWM_CLK.

32.3.1.2 Timer Submodule

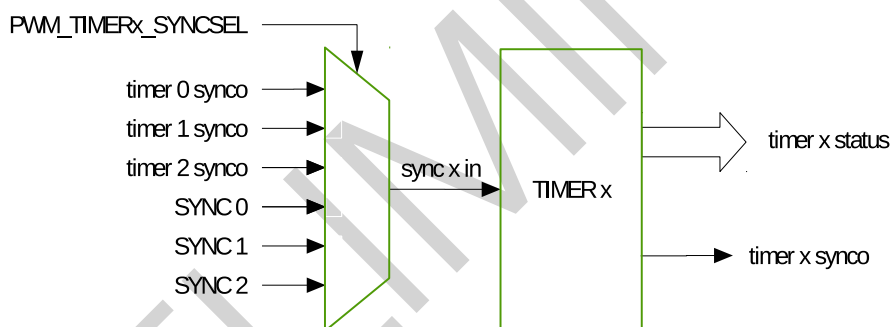

Figure 32-3. Timer Submodule

Configuration options:

- Set the PWM timer frequency or period.
- Configure the working mode for the timer:
 - Count-Up Mode: for asymmetric PWM outputs
 - Count-Down Mode: for asymmetric PWM outputs
 - Count-Up-Down Mode: for symmetric PWM outputs
- Configure the the reloading phase (including the value and the direction) used during software and hardware synchronization.
- Synchronize the PWM timers with each other. Either hardware or software synchronization may be used.
- Configure the source of the PWM timer's the synchronization input to one of the seven sources below:

- The three PWM timer's synchronization outputs.
- Three synchronization signals from the GPIO matrix: PWMn_SYNC0_IN, PWMn_SYNC1_IN, PWMn_SYNC2_IN.
- No synchronization input signal selected
- Configure the source of the PWM timer's synchronization output to one of the four sources below:
 - Synchronization input signal
 - Event generated when value of the PWM timer is equal to zero
 - Event generated when value of the PWM timer is equal to period
 - Event generated when writing toggling value to `MCPWM_TIMERx_SYNC_SW` bit
- Configure the method of period updating.

32.3.1.3 Operator Submodule

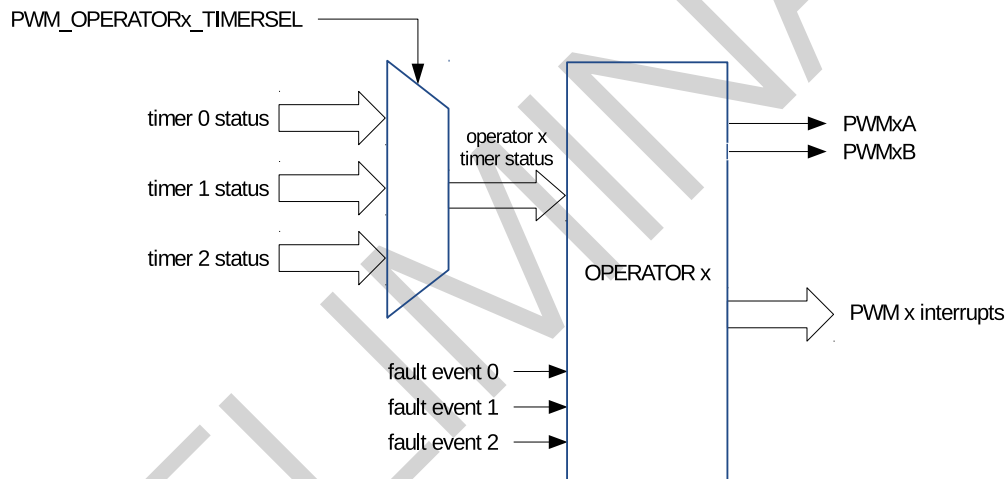

Figure 32-4. Operator Submodule

The configuration parameters of the operator submodule are shown in Table 32-1.

Table 32-1. Configuration Parameters of the Operator Submodule

Submodule	Configuration Parameter or Option
PWM Generator	<ul style="list-style-type: none"> • Set up the PWM duty cycle for PWMxA and/or PWMxB output. • Set up at which time the timing events occur. • Define what action should be taken on timing events: <ul style="list-style-type: none"> – Switch high or low of PWMxA and/or PWMxB outputs – Toggle PWMxA and/or PWMxB outputs – Take no action on outputs • Use direct s/w control to force the state of PWM outputs • Add a dead time to raising edge and/or falling edge on PWM outputs. • Configure update method for this submodule.
Dead Time Generator	<ul style="list-style-type: none"> • Control of complementary dead time relationship between upper and lower switches. • Specify the dead time on rising edge. • Specify the dead time on falling edge. • Bypass the dead time generator module. The PWM waveform will pass through without inserting dead time. • Allow PWMxB phase shifting with respect to the PWMxA output. • Configure updating method for this submodule.
PWM Carrier	<ul style="list-style-type: none"> • Enable carrier and set up carrier frequency. • Configure duration of the first pulse in the carrier waveform. • Set up the duty cycle of the following pulses. • Bypass the PWM carrier module. The PWM waveform will be passed through without modification.
Fault Handler	<ul style="list-style-type: none"> • Configure if and how the PWM module should react the fault event signals. • Specify the action taken when a fault event occurs: <ul style="list-style-type: none"> – Force PWMxA and/or PWMxB high. – Force PWMxA and/or PWMxB low. – Configure PWMxA and/or PWMxB to ignore any fault event. • Configure how often the PWM should react to fault events: <ul style="list-style-type: none"> – One-shot – Cycle-by-cycle • Generate interrupts. • Bypass the fault handler submodule entirely. • Set up an option for cycle-by-cycle actions clearing. • If desired, independently-configured actions can be taken when time-base counter is counting down or up.

32.3.1.4 Fault Detection Submodule

Figure 32-5. Fault Detection Submodule

Configuration options:

- Enable fault event generation and configure the polarity of fault event generation for every fault signal
- Generate fault event interrupts

32.3.1.5 Capture Submodule

Figure 32-6. Capture Submodule

Configuration options:

- Select the edge polarity and prescaling of the capture input.
- Set up a software-triggered capture.
- Configure the capture timer's sync trigger and sync phase.
- Software syncs the capture timer.

32.3.2 PWM Timer Submodule

Each MCPWM module has three PWM timer submodules. Any of them can determine the necessary event timing for any of the three PWM operator submodules. Built-in synchronization logic allows multiple PWM timer submodules, in one or more MCPWM modules, to work together as a system, when using synchronization signals from the GPIO matrix.

32.3.2.1 Configurations of the PWM Timer Submodule

Users can configure the following functions of the PWM timer submodule:

- Control how often events occur by specifying the PWM timer frequency or period.
- Configure a particular PWM timer to synchronize with other PWM timers or modules.

- Get a PWM timer in phase with other PWM timers or modules.
- Set one of the following timer counting modes: count-up, count-down, count-up-down.
- Change the rate of the PWM timer clock (PT_clk) with a prescaler. Each timer has its own prescaler configured with `MCPWM_TIMERx_PRESCALE` of the register `MCPWM_TIMER0_CFG0_REG`. The PWM timer increments or decrements at a slower pace, depending on the setting of this field.

32.3.2.2 PWM Timer's Working Modes and Timing Event Generation

The PWM timer has three working modes, selected by the PWM x timer mode field:

- **Count-Up Mode:**
In this mode, the PWM timer increments from zero until reaching the value configured in the period field. Once done, the PWM timer returns to zero and starts increasing again. PWM period is equal to the value of the period field + 1.
Note: The period field is `MCPWM_TIMERx_PERIOD` ($x = 0, 1, 2$), i.e., `MCPWM_TIMER0_PERIOD`, `MCPWM_TIMER1_PERIOD`, `MCPWM_TIMER2_PERIOD`.
- **Count-Down Mode:**
The PWM timer decrements to zero, starting from the value configured in the period field. After reaching zero, it is set back to the period value. Then it starts to decrement again. In this case, the PWM period is also equal to the value of period field + 1.
- **Count-Up-Down Mode:**
This is a combination of the two modes mentioned above. The PWM timer starts increasing from zero until the period value is reached. Then, the timer decreases back to zero. This pattern is then repeated. The PWM period is the result of (the value of the period field $\times 2 + 1$).

Figures 32-7 to 32-10 show PWM timer waveforms in different modes, including timer behavior during synchronization events. In Count-Up mode, the counting direction after synchronization is always counting up, while in Count-Down mode, the counting direction after synchronization is always counting down. In Count-Up-Down Mode, the counting direction after synchronization can be chosen by setting the `MCPWM_TIMERx_PHASE_DIRECTION`.

Figure 32-7. Count-Up Mode Waveform

Figure 32-8. Count-Down Mode Waveforms

Figure 32-9. Count-Up-Down Mode Waveforms, Count-Down at Synchronization Event

Figure 32-10. Count-Up-Down Mode Waveforms, Count-Up at Synchronization Event

When the PWM timer is running, it generates the following timing events periodically and automatically:

- UTEP
The timing event generated when the PWM timer's value equals to the value of the period field (`MCPWM_TIMERx_PERIOD`) and when the PWM timer is increasing.
- UTEZ
The timing event generated when the PWM timer's value equals to zero and when the PWM timer is increasing.
- DTEP
The timing event generated when the PWM timer's value equals to the value of the period field (`MCPWM_TIMERx_PERIOD`) and when the PWM timer is decreasing.
- DTEZ
The timing event generated when the PWM timer's value equals to zero and when the PWM timer is decreasing.

Figures 32-11 to 32-13 show the timing waveforms of U/DTEP and U/DTEZ.

Figure 32-11. UTEP and UTEZ Generation in Count-Up Mode

Figure 32-12. DTEP and DTEZ Generation in Count-Down Mode

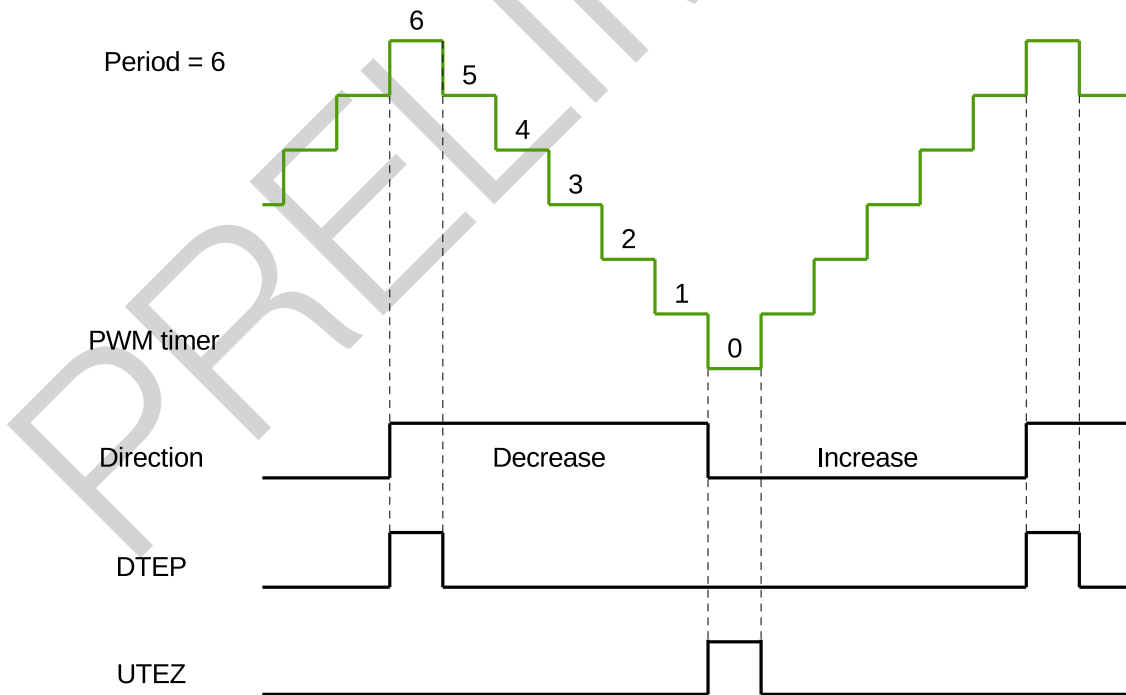

Figure 32-13. DTEP and UTEZ Generation in Count-Up-Down Mode

32.3.2.3 PWM Timer Shadow Register

The PWM timer's period register and the PWM timer's clock prescaler register have shadow registers. The purpose of a shadow register is to save a copy of the value to be written into the active register at a specific moment synchronized with the hardware. Both register types are defined as follows:

- Active Register

This register is directly responsible for controlling all actions performed by hardware.

- Shadow Register

It acts as a temporary buffer for a value to be written to the active register. At a specific, user-configured point in time, the value saved in the shadow register is copied to the active register. Before this happens, the content of the shadow register has no direct effect on the controlled hardware. This helps to prevent spurious operation of the hardware, which may happen when a register is asynchronously modified by software. Both the shadow register and the active register have the same memory address. The software always writes into, or reads from the shadow register.

The moment of updating the clock prescaler's active register is at the time when the timer starts operating. When `MCPWM_GLOBAL_UP_EN` is set to 1, the moment of updating the period active register can be selected by the following ways. By setting the update method register of `MCPWM_TIMERx_PERIOD_UPMETHOD`, the update can start when the PWM timer is equal to zero, when the PWM timer is equal to period, at a synchronization moment, or immediately. Software can also trigger a globally forced update bit `MCPWM_GLOBAL_FORCE_UP` which will prompt all registers in the module to be updated according to shadow registers.

32.3.2.4 PWM Timer Synchronization and Phase Locking

The PWM modules adopt a flexible synchronization method. Each PWM timer has a synchronization input and a synchronization output. The synchronization input can be selected from three synchronization outputs and three synchronization signals from the GPIO matrix. The synchronization output can be generated from the synchronization input signal, when the PWM timer's value is equal to period or zero, or software synchronization. Thus, the PWM timers can be chained together with their phase locked. During synchronization, the PWM timer clock prescaler will reset its counter in order to synchronize the PWM timer clock.

32.3.3 PWM Operator Submodule

The PWM Operator submodule has the following functions:

- Generates a PWM signal pair, based on timing references obtained from the corresponding PWM timer.
- Each signal out of the PWM signal pair includes a specific pattern of dead time.
- Superimposes a carrier on the PWM signal, if configured to do so.
- Handles response under fault conditions.

Figure 32-14 shows the block diagram of a PWM operator.

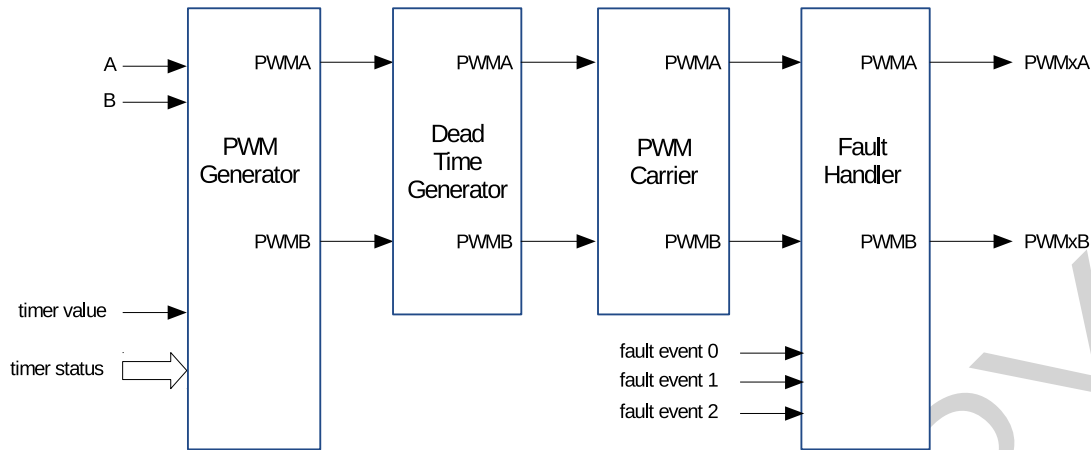

Figure 32-14. Submodules Inside the PWM Operator

32.3.3.1 PWM Generator Submodule

Purpose of the PWM Generator Submodule

In this submodule, important timing events are generated or imported. The events are then converted into specific actions to generate the desired waveforms at the PWMxA and PWMxB outputs.

The PWM generator submodule performs the following actions:

- Generation of timing events based on time stamps configured using the A and B registers. Events happen when the following conditions are satisfied:
 - UTEA: the PWM timer is counting up and its value is equal to register A.
 - UTEB: the PWM timer is counting up and its value is equal to register B.
 - DTEA: the PWM timer is counting down and its value is equal to register A.
 - DTEB: the PWM timer is counting down and its value is equal to register B.
- Generation of U/DT1, U/DT2 timing events based on fault or synchronization events.
- Management of priority when these timing events occur concurrently.
- Qualification and generation of set, clear and toggle actions, based on the timing events.
- Controlling of the PWM duty cycle, depending on configuration of the PWM generator submodule.
- Handling of new time stamp values, using shadow registers to prevent glitches in the PWM cycle.

PWM Operator Shadow Registers

The time stamp registers A and B, as well as action configuration registers [MCPWM_GENx_A_REG](#) and [MCPWM_GENx_B_REG](#) are shadowed. Shadowing provides a way of updating registers in sync with the hardware.

When [MCPWM_GLOBAL_UP_EN](#) is set to 1, the shadow registers can be written to the active register at a

specified time. The update method fields for time stamp registers A and B are [MCPWM_GEN_A_UPMETHOD](#) and [MCPWM_GEN_B_UPMETHOD](#). The update method field for [MCPWM_GENx_A_REG](#) and [MCPWM_GENx_B_REG](#) is [MCPWM_GEN_CFG_UPMETHOD](#). Software can also trigger a globally forced update bit

[MCPWM_GLOBAL_FORCE_UP](#) which will prompt all registers in the module to be updated according to shadow registers. For a description of the shadow registers, please see [32.3.2.3](#).

Timing Events

For convenience, all timing signals and events are summarized in [Table 32-2](#).

Table 32-2. Timing Events Used in PWM Generator

Signal	Event Description	PWM Timer Operation
DTEP	PWM timer value is equal to the period register value	PWM timer counts down.
DTEZ	PWM timer value is equal to zero	
DTEA	PWM timer value is equal to A register	
DTEB	PWM timer value is equal to B register	
DT0 event	Based on fault or synchronization events	
DT1 event	Based on fault or synchronization events	
UTEP	PWM timer value is equal to the period register value	PWM timer counts up.
UTEZ	PWM timer value is equal to zero	
UTEA	PWM timer value is equal to A register	
UTEB	PWM timer value is equal to B register	
UT0 event	Based on fault or synchronization events	
UT1 event	Based on fault or synchronization events	
Software-force event	Software-initiated asynchronous event	N/A

The purpose of a software-force event is to impose non-continuous or continuous changes on the PWMxA and PWMxB outputs. The change is done asynchronously. Software-force control is handled by the [MCPWM_GENx_FORCE_REG](#) registers.

The selection and configuration of T0/T1 in the PWM generator submodule is independent of the configuration of fault events in the fault handler submodule. A particular trip event may or may not be configured to cause trip action in the fault handler submodule, but the same event can be used by the PWM generator to trigger T0/T1 for controlling PWM waveforms.

It is important to know that when the PWM timer is in count-up-down mode, it will always decrement after a TEP event, and will always increment after a TEZ event. So when the PWM timer is in count-up-down mode, DTEP and UTEZ events will occur, while the events UTEP and DTEZ will never occur.

The PWM generator can handle multiple events at the same time. Events are prioritized by the hardware and relevant details are provided in [Table 32-3](#) and [Table 32-4](#). Priority levels range from 1 (the highest) to 7 (the lowest). Please note that the priority of TEP and TEZ events depends on the PWM timer's direction.

If the value of A or B is set to be greater than the period, then U/DTEA and U/DTEB will never occur.

Table 32-3. Timing Events Priority When PWM Timer Increments

Priority Level	Event
1 (highest)	Software-force event
2	UTEP
3	UT0
4	UT1
5	UTEB
6	UTEA
7 (lowest)	UTEZ

Table 32-4. Timing Events Priority when PWM Timer Decrements

Priority level	Event
1 (highest)	Software-force event
2	DTEZ
3	DT0
4	DT1
5	DTEB
6	DTEA
7 (lowest)	DTEP

Notes:

1. UTEP and UTEZ do not happen simultaneously. When the PWM timer is in count-up mode, UTEP will always happen one cycle earlier than UTEZ, as demonstrated in Figure 32-11, so their action on PWM signals will not interrupt each other. When the PWM timer is in count-up-down mode, UTEP will not occur.
2. DTEP and DTEZ do not happen simultaneously. When the PWM timer is in count-down mode, DTEZ will always happen one cycle earlier than DTEP, as demonstrated in Figure 32-12, so their action on PWM signals will not interrupt each other. When the PWM timer is in count-up-down mode, DTEZ will not occur.

PWM Signal Generation

The PWM generator submodule controls the behavior of outputs PWMxA and PWMxB when a particular timing event occurs. The timing events are further qualified by the PWM timer's counting direction (up or down). Knowing the counting direction, the submodule may then perform an independent action at each stage of the PWM timer counting up or down.

The following actions may be configured on outputs PWMxA and PWMxB:

- Set High:
Set the output of PWMxA or PWMxB to a high level.
- Clear Low:
Clear the output of PWMxA or PWMxB by setting it to a low level.
- Toggle:

Change the current output level of PWMxA or PWMxB to the opposite value. If it is currently pulled high, pull it low, or vice versa.

- Do Nothing:
Keep both outputs PWMxA and PWMxB unchanged. In this state, interrupts can still be triggered.

The configuration of actions on outputs is done by using registers `MCPWN_GENx_A_REG` and `MCPWN_GENx_B_REG`. So, the action to be taken on each output is set independently. Also there is great flexibility in selecting actions to be taken on a given output based on events. More specifically, any event listed in Table 32-2 can operate on either output PWMxA or PWMxB. To check out registers for particular generator 0, 1 or 2, please refer to register description in Section 32.4.

Waveforms for Common Configurations

Figure 32-15 presents the symmetric PWM waveform generated when the PWM timer is counting up and down. DC 0%–100% modulation can be calculated via the formula below:

$$Duty = (Period - A) \div Period$$

If A matches the PWM timer value and the PWM timer is incrementing, then the PWM output is pulled up. If A matches the PWM timer value while the PWM timer is decrementing, then the PWM output is pulled low.

Figure 32-15. Symmetrical Waveform in Count-Up-Down Mode

The PWM waveforms in Figures 32-16 to 32-19 show some common PWM operator configurations. The following conventions are used in the figures:

- Period A and B refer to the values written in the corresponding registers.
- PWMxA and PWMxB are the output signals of PWM Operator x.

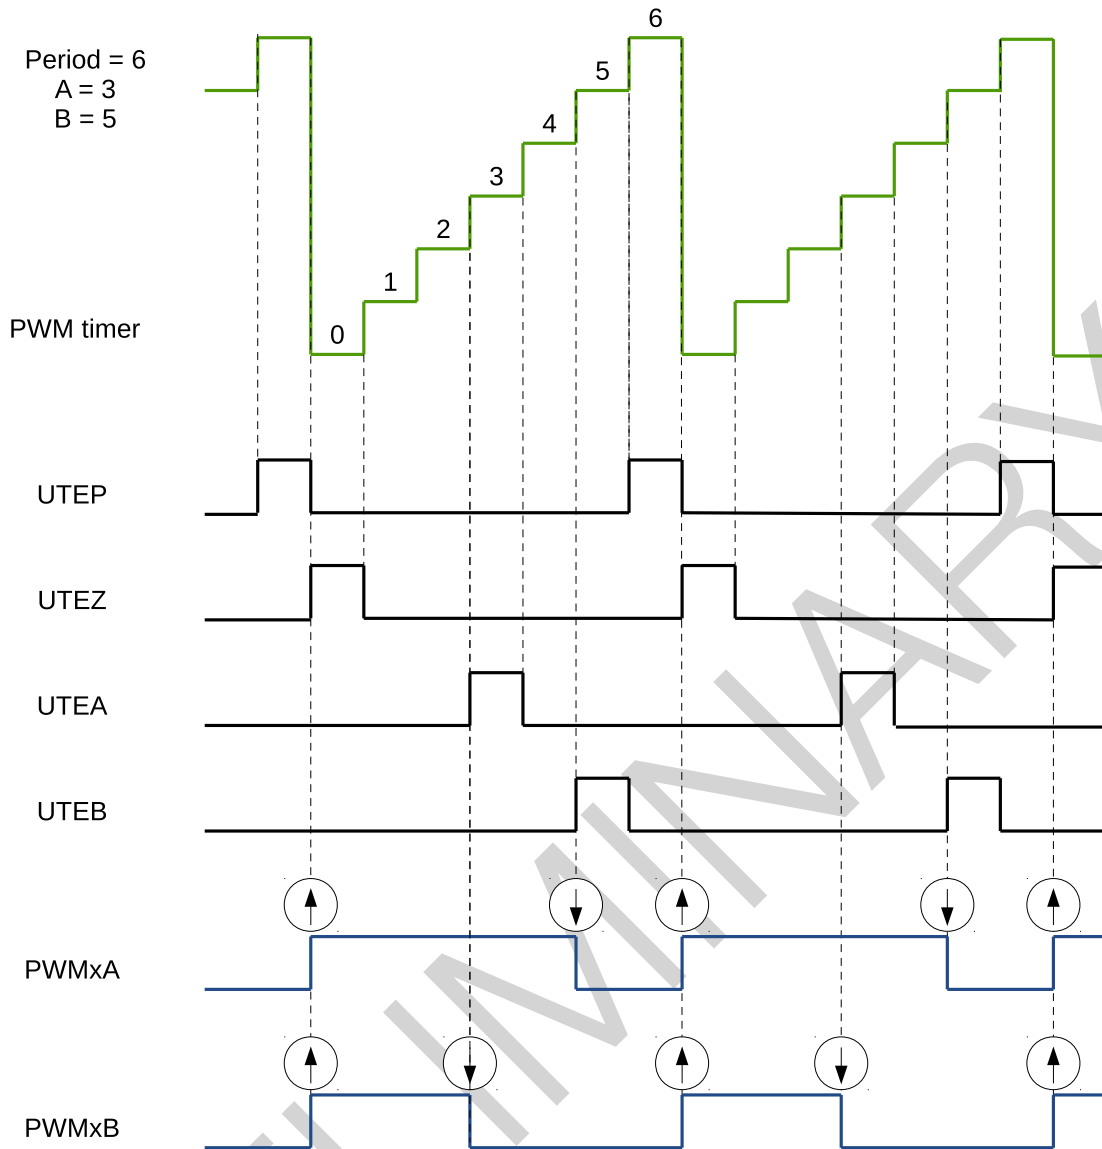

Figure 32-16. Count-Up, Single Edge Asymmetric Waveform, with Independent Modulation on PWMxA and PWMxB — Active High

The duty modulation for PWMxA is set by B, active high and proportional to B.

The duty modulation for PWMxB is set by A, active high and proportional to A.

$$Period = (MCPWM_TIMER_PERIOD + 1) \times T_{PT_clk}$$

Figure 32-17. Count-Up, Pulse Placement Asymmetric Waveform with Independent Modulation on PWMxA

Pulses may be generated anywhere within the PWM cycle (zero – period).

PWMxA's high time duty is proportional to (B – A).

$$Period = (MCPWM_TIMER_PERIOD + 1) \times T_{PT_clk}$$

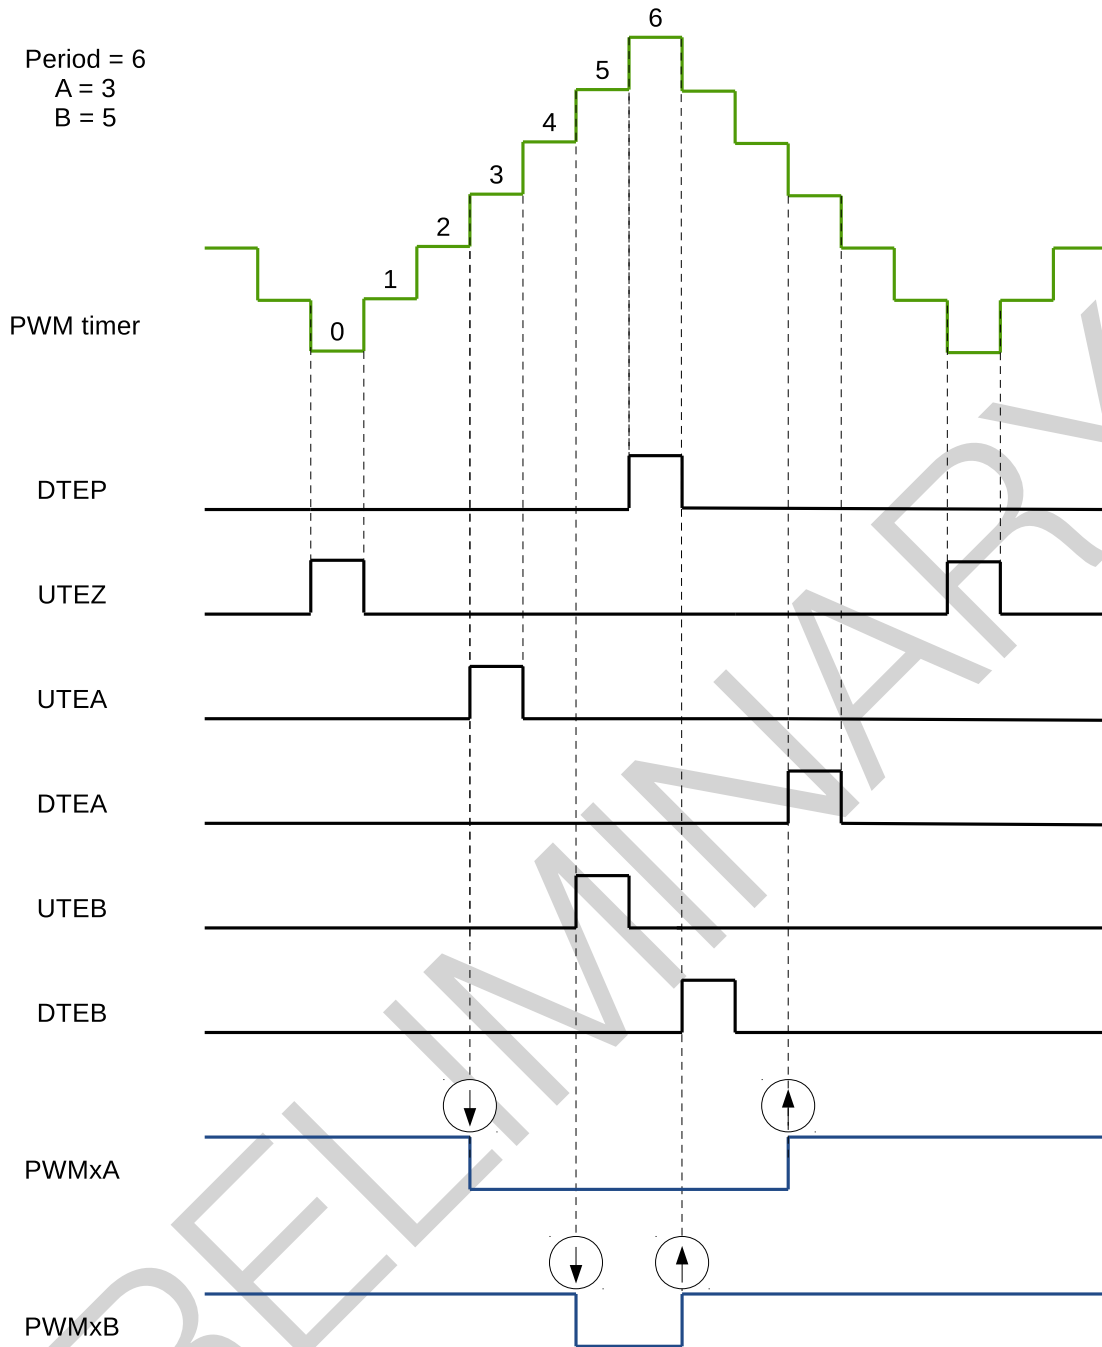

Figure 32-18. Count-Up-Down, Dual Edge Symmetric Waveform, with Independent Modulation on PWMxA and PWMxB – Active High

The duty modulation for PWMxA is set by A, active high and proportional to A.
The duty modulation for PWMxB is set by B, active high and proportional to B.
Outputs PWMxA and PWMxB can drive independent switches.

$$Period = (2 \times MCPWM_TIMER_PERIOD) \times T_{PT_clk}$$

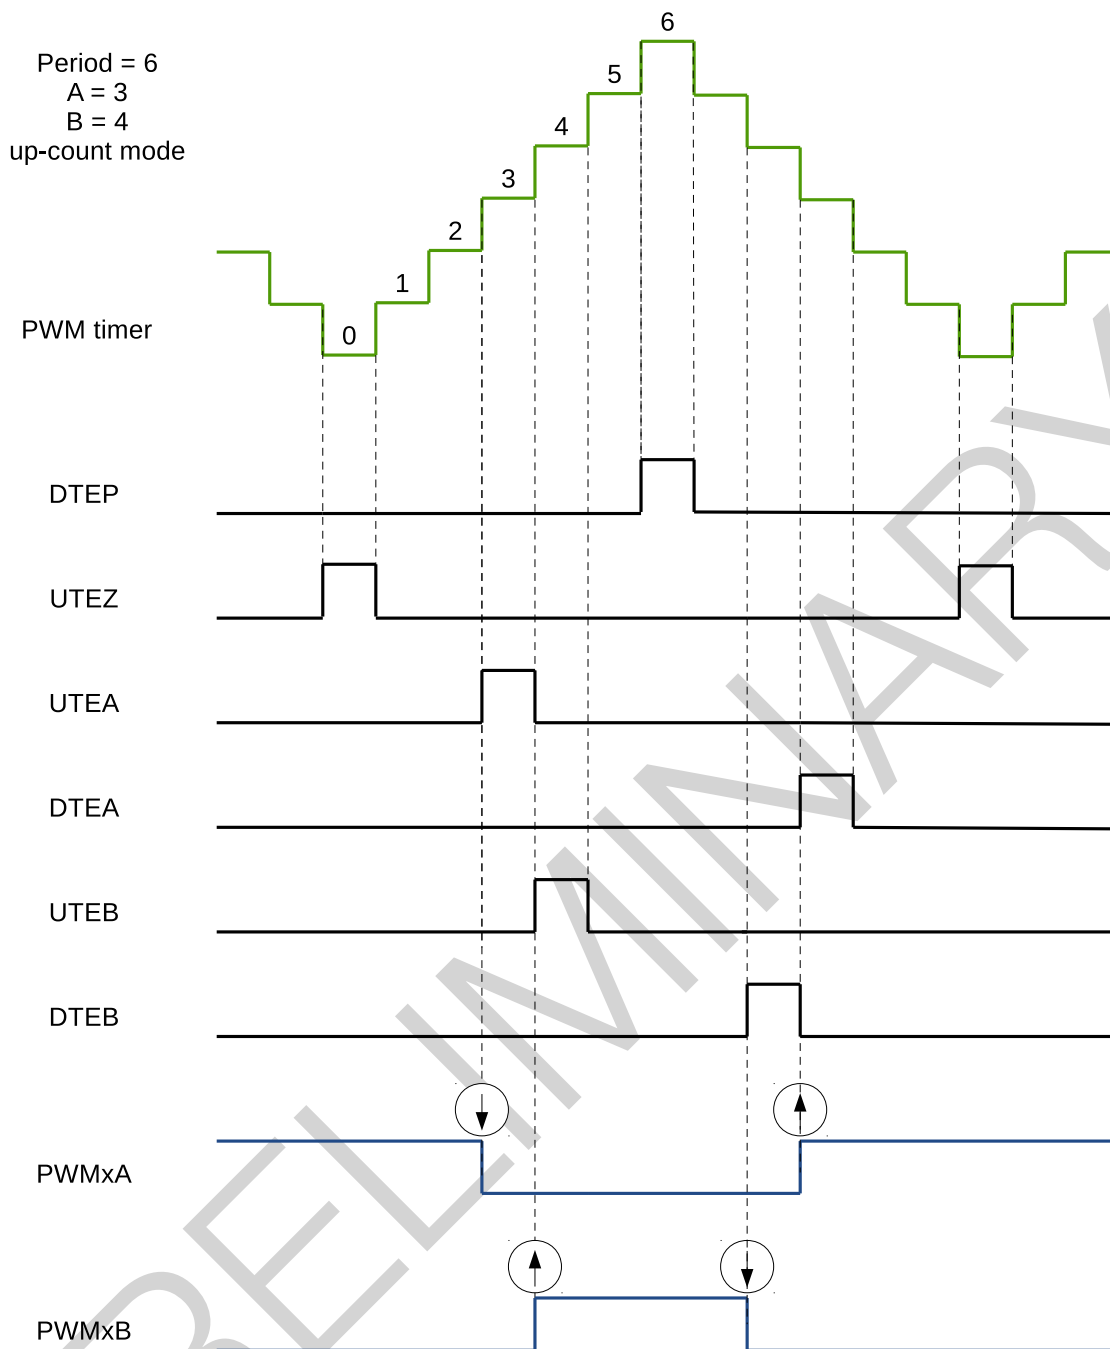

Figure 32-19. Count-Up-Down, Dual Edge Symmetric Waveform, with Independent Modulation on PWMxA and PWMxB – Complementary

The duty modulation of PWMxA is set by A, is active high and proportional to A.

The duty modulation of PWMxB is set by B, is active low and proportional to B.

Outputs PWMx can drive upper/lower (complementary) switches.

Dead-time = B – A; Edge placement is fully programmable by software. Use the dead-time generator module if another edge delay method is required.

$$Period = (2 \times MCPWM_TIMER_PERIOD) \times T_{PT_clk}$$

Software-Force Events

There are two types of software-force events inside the PWM generator:

- Non-continuous-immediate (NCI) software-force events
Such types of events are immediately effective on PWM outputs when triggered by software. The forcing is non-continuous, meaning the next active timing events will be able to alter the PWM outputs.
- Continuous (CNTU) software-force events
Such types of events are continuous. The forced PWM outputs will continue until they are released by software. The events' triggers are configurable. They can be timing events or immediate events.

Figure 32-20 shows a waveform of NCI software-force events. NCI events are used to force PWMxA output low. Forcing on PWMxB is disabled in this case.

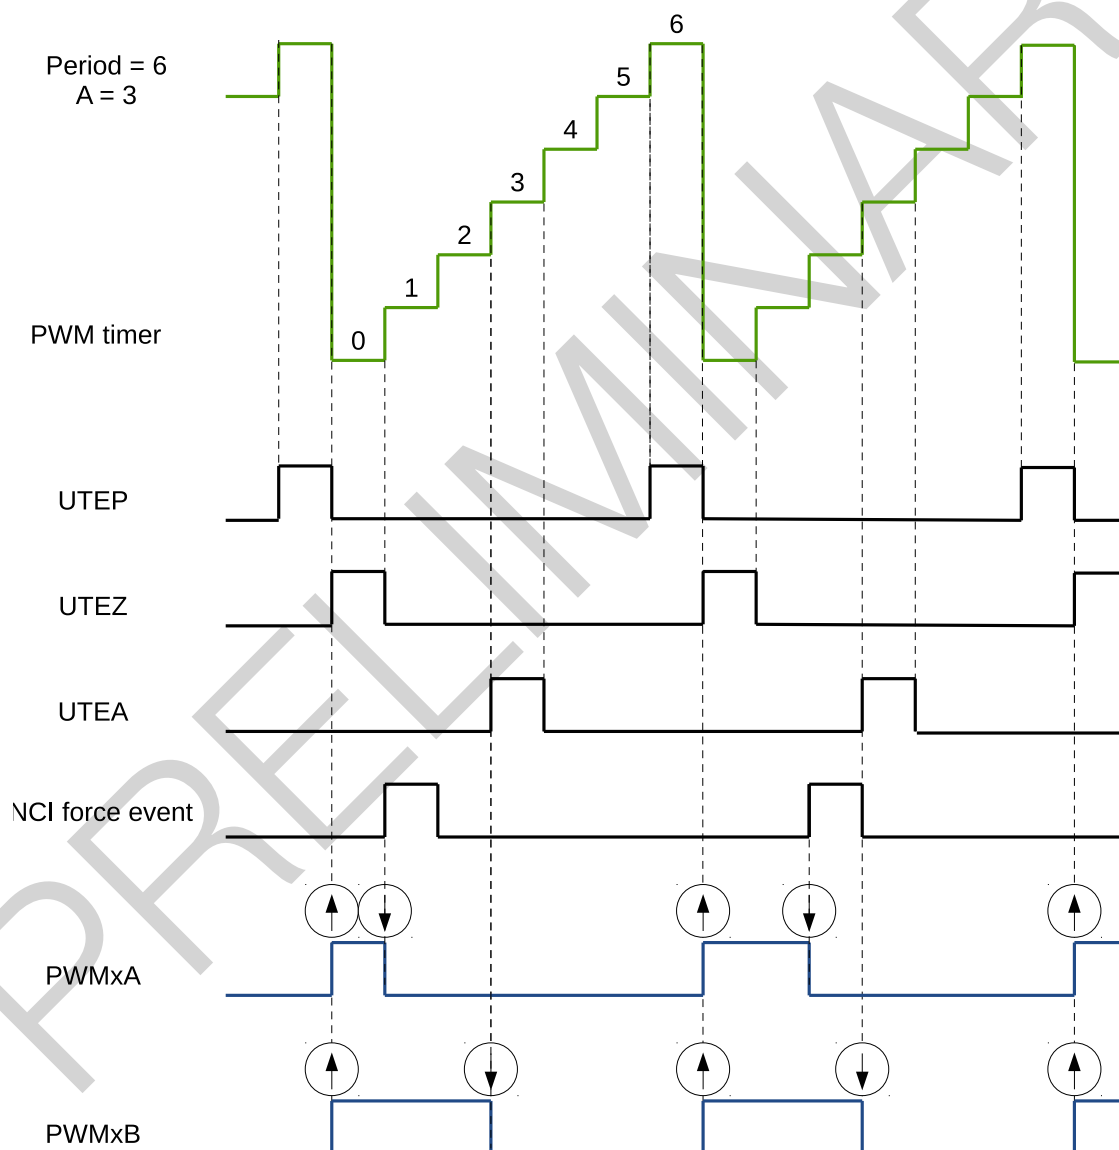

Figure 32-20. Example of an NCI Software-Force Event on PWMxA

Figure 32-21 shows a waveform of CNTU software-force events. UTEZ events are selected as triggers for CNTU software-force events. CNTU is used to force the PWMxB output low. Forcing on PWMxA is disabled.

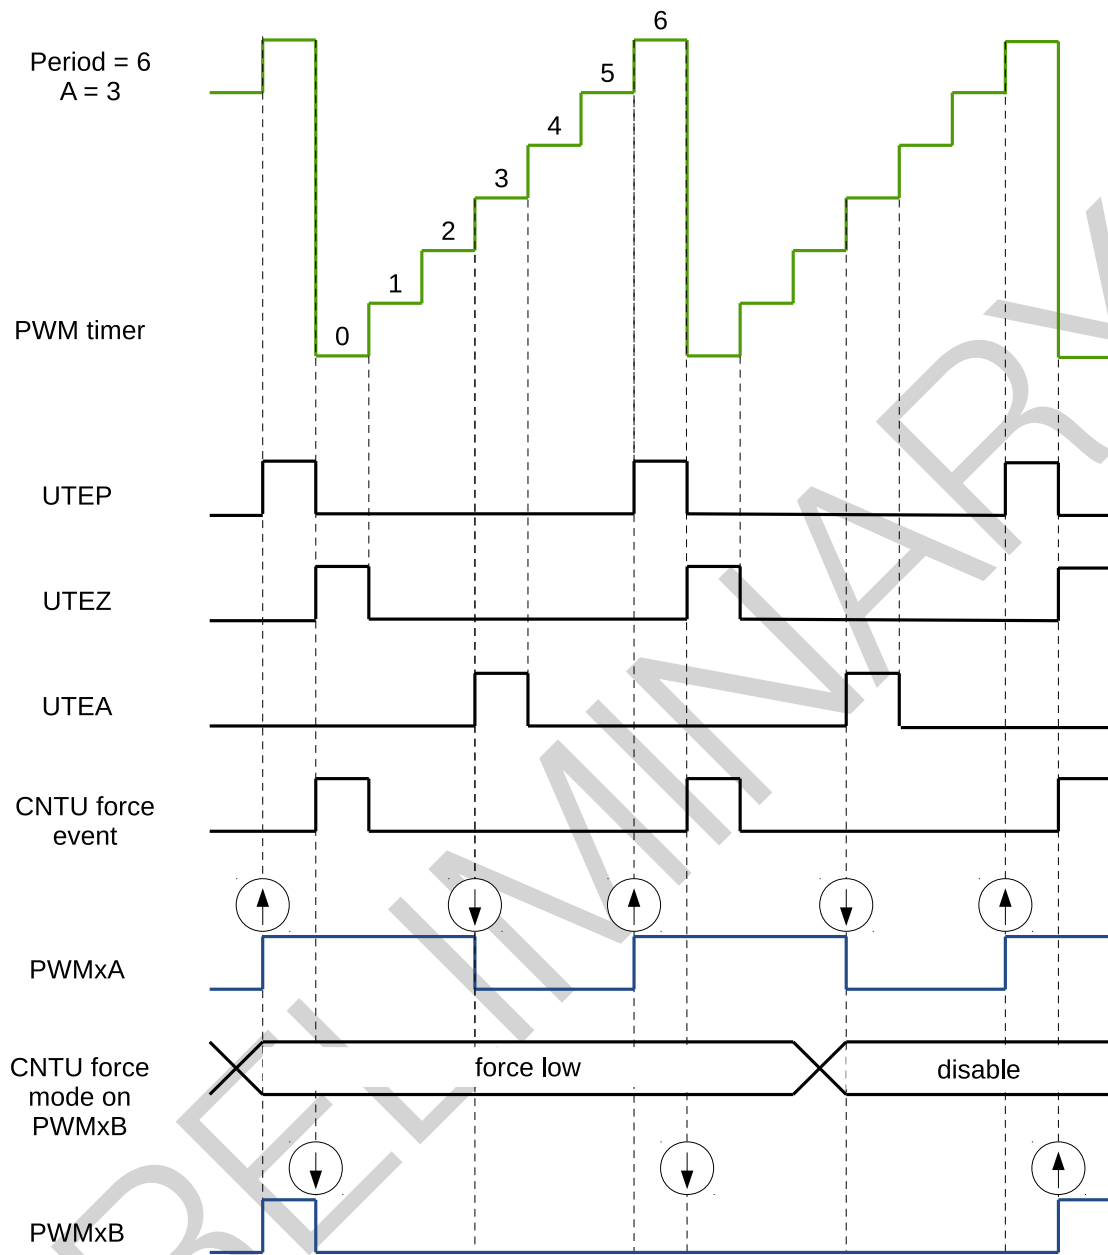

Figure 32-21. Example of a CNTU Software-Force Event on PWMxB

32.3.3.2 Dead Time Generator Submodule

Purpose of the Dead Time Generator Submodule

Several options to generate signals on PWMxA and PWMxB outputs, with a specific placement of signal edges, have been discussed in section 32.3.3.1. The required dead time is obtained by altering the edge placement between signals and by setting the signal's duty cycle. Another option is to control the dead time using a specialized submodule – the Dead Time Generator.

The key functions of the dead time generator submodule are as follows:

- Generating signal pairs (PWMxA and PWMxB) with a dead time from a single PWMxA input
- Creating a dead time by adding delay to signal edges:
 - Rising edge delay (RED)
 - Falling edge delay (FED)
- Configuring the signal pairs to be:
 - Active high complementary (AHC)
 - Active low complementary (ALC)
 - Active high (AH)
 - Active low (AL)
- This submodule may also be bypassed, if the dead time is configured directly in the generator submodule.

Dead Time Generator's Shadow Registers

Delay registers RED and FED are shadowed with registers [MCPWM_DT_x_RED_CFG_REG](#) and [MCPWM_DT_x_FED_CFG_REG](#). When [MCPWM_GLOBAL_UP_EN](#) is set to 1, the shadow registers can be written to the active register at specified time. The update method register for [MCPWM_DT_x_RED_CFG_REG](#) is [MCPWM_DT_RED_UPMETHOD](#). The update method register for [MCPWM_DT_x_FED_CFG_REG](#) is [MCPWM_DT_FED_UPMETHOD](#). The Software can also trigger a globally forced update bit [MCPWM_GLOBAL_FORCE_UP](#) which will prompt all registers in the module to be updated according to shadow registers. For the description of shadow registers, please see section 32.3.2.3.

Highlights for Operation of the Dead Time Generator

Options for setting up the dead-time submodule are shown in Figure 32-22.

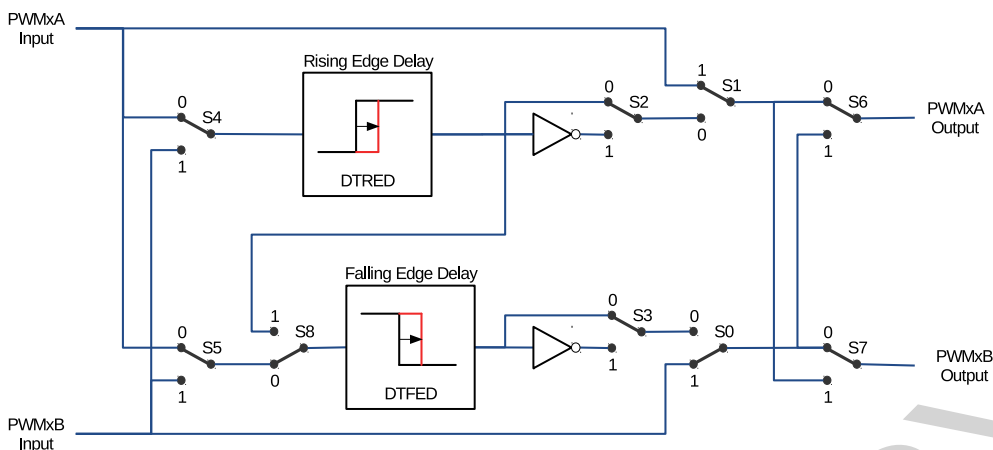

Figure 32-22. Options for Setting up the Dead Time Generator Submodule

S0-S8 in the figure above are switches controlled by fields in register `MCPWM_DTxCFG_REG` shown in Table 32-5.

Table 32-5. Dead Time Generator Switches Control Fields

Switch	Field

S6	<code>MCPWM_DT_x_A_OUTSWAP</code>
S7	<code>MCPWM_DT_x_B_OUTSWAP</code>
S8	<code>MCPWM_DT_x_DEB_MODE</code>

All switch combinations are supported, but not all of them represent the typical modes of use. Table 32-6 documents some typical dead time configurations. In these configurations the position of S4 and S5 sets PWMxA as the common source of both falling-edge and rising-edge delay. The modes presented in table 32-6 may be categorized as follows:

Table 32-6. Typical Dead Time Generator Operating Modes

Mode	Mode Description	S0	S1	S2	S3
1	PWMxA and PWMxB Pass Through/No Delay	1	1	X	X
2	Active High Complementary (AHC), see Figure 32-23	0	0	0	1
3	Active Low Complementary (ALC), see Figure 32-24	0	0	1	0
4	Active High (AH), see Figure 32-25	0	0	0	0
5	Active Low (AL), see Figure 32-26	0	0	1	1
6	PWMxA Output = PWMxA In (No Delay) PWMxB Output = PWMxA Input with Falling Edge Delay	0	1	0 or 1	0 or 1
7	PWMxA Output = PWMxA Input with Rising Edge Delay PWMxB Output = PWMxB Input with No Delay	1	0	0 or 1	0 or 1

Note:

For all the modes above, the position of the binary switches S4 to S8 is set to 0.

- **Mode 1: Bypass delays on both falling (FED) as well as raising edge (RED)**

In this mode the dead time submodule is disabled. Signals PWMxA and PWMxB pass through without any modifications.

- **Mode 2-5: Classical Dead Time Polarity Settings**

These modes represent typical configurations of polarity and should cover the active-high/low modes in available industry power switch gate drivers. The typical waveforms are shown in Figures 32-23 to 32-26.

- **Modes 6 and 7: Bypass delay on falling edge (FED) or rising edge (RED)**

In these modes, either RED (Rising Edge Delay) or FED (Falling Edge Delay) is bypassed. As a result, the corresponding delay is not applied.

Figure 32-23. Active High Complementary (AHC) Dead Time Waveforms

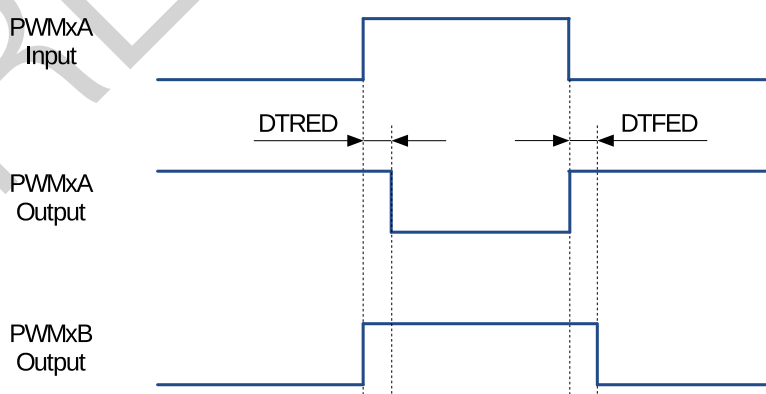

Figure 32-24. Active Low Complementary (ALC) Dead Time Waveforms

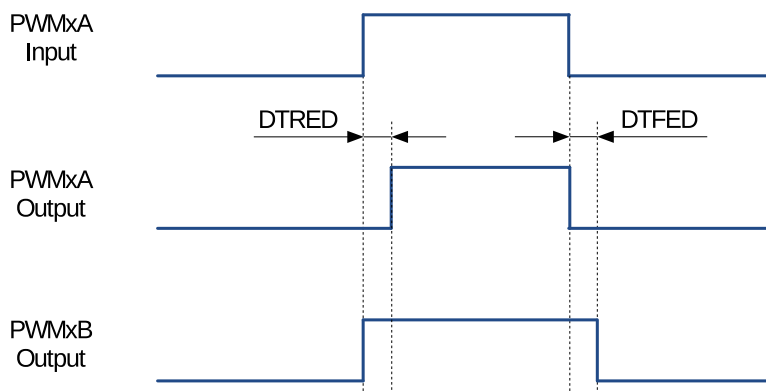

Figure 32-25. Active High (AH) Dead Time Waveforms

Figure 32-26. Active Low (AL) Dead Time Waveforms

Rising edge (RED) and falling edge (FED) delays may be set up independently. The delay value is programmed using the 16-bit registers `MCPWM_DT x _RED` and `MCPWM_DT x _FED`. The register value represents the number of clock (`DT_clk`) periods by which a signal edge is delayed. `DT_CLK` can be selected from `PWM_clk` or `PT_clk` through register `MCPWM_DT x _CLK_SEL`.

To calculate the delay on falling edge (FED) and rising edge (RED), use the following formulas:

$$FED = MCPWM_DTx_FED \times T_{DT_clk}$$

$$RED = MCPWM_DTx_RED \times T_{DT_clk}$$

32.3.3.3 PWM Carrier Submodule

The coupling of PWM output to a motor driver may need isolation with a transformer. Transformers deliver only AC signals, while the duty cycle of a PWM signal may range anywhere from 0% to 100%. The PWM carrier submodule passes such a PWM signal through a transformer by using a high frequency carrier to modulate the signal.

Function Overview

The following key characteristics of this submodule are configurable:

- Carrier frequency
- Pulse width of the first pulse
- Duty cycle of the second and the subsequent pulses
- Enabling/disabling the carrier function

Operational Highlights

The PWM carrier clock (PC_clk) is derived from PWM_clk. The frequency and duty cycle are configured by the `MCPWM_CARRIERx_PRESCALE` and `MCPWM_CARRIERx_DUTY` bits in the `MCPWM_CARRIERx_CFG_REG` register. The purpose of one-shot pulses is to provide high-energy impulse to reliably turn on the power switch. Subsequent pulses sustain the power-on status. The width of a one-shot pulse is configurable with the `MCPWM_CARRIERx_OSHTWTH` bits. Enabling/disabling of the carrier submodule is done with the `MCPWM_CARRIERx_EN` bit.

Waveform Examples

Figure 32-27 shows an example of waveforms, where a carrier is superimposed on original PWM pulses. This figure do not show the first one-shot pulse and the duty-cycle control. Related details are covered in the following two sections.

Figure 32-27. Example of Waveforms Showing PWM Carrier Action

One-Shot Pulse

The width of the first pulse is configurable. It may assume one of 16 possible values and is described by the formula below:

$$T_{1stpulse} = T_{PWM_clk} \times 8 \times (MCPWM_CARRIERx_PRESCALE + 1) \times (MCPWM_CARRIERx_OSHTWTH + 1)$$

Where:

- T_{PWM_clk} is the period of the PWM clock (PWM_clk).
- $(MCPWM_CARRIERx_OSHTWTH + 1)$ is the width of the first pulse (whose value ranges from 1 to 16).
- $(MCPWM_CARRIERx_PRESCALE + 1)$ is the PWM carrier clock's (PC_clk) prescaler value.

The first one-shot pulse and subsequent sustaining pulses are shown in Figure 32-28.

Figure 32-28. Example of the First Pulse and the Subsequent Sustaining Pulses of the PWM Carrier Submodule

Duty Cycle Control

After issuing the first one-shot pulse, the remaining PWM signal is modulated according to the carrier frequency. Users can configure the duty cycle of this signal. Tuning of duty may be required, so that the signal passes through the isolating transformer and can still operate (turn on/off) the motor drive, changing rotation speed and direction.

The duty cycle may be set to one of seven values, using `MCPWM_CARRIERx_DUTY`, or bits [7:5] of register

`MCPWM_CARRIERx_CFG_REG`.

Below is the formula for calculating the duty cycle:

$$Duty = MCPWM_CARRIERx_DUTY \div 8$$

All seven settings of the duty cycle are shown in Figure 32-29.

Figure 32-29. Possible Duty Cycle Settings for Sustaining Pulses in the PWM Carrier Submodule

32.3.3.4 Fault Handler Submodule

Each MCPWM peripheral is connected to three fault signals (FAULT0, FAULT1 and FAULT2) which are sourced from the GPIO matrix. These signals are intended to indicate external fault conditions, and may be preprocessed by the fault detection submodule to generate fault events. Fault events can then execute the user code to control MCPWM outputs in response to specific faults.

Function of Fault Handler Submodule

The key actions performed by the fault handler submodule are:

- Forcing outputs PWMxA and PWMxB, upon detected fault, to one of the following states:
 - High
 - Low
 - Toggle
 - No action taken
- Execution of one-shot trip (OST) upon detection of over-current conditions/short circuits.
- Cycle-by-cycle tripping (CBC) to provide current-limiting operation.
- Allocation of either one-shot or cycle-by-cycle operation for each fault signal.
- Generation of interrupts for each fault input.
- Support for software-force tripping.
- Enabling or disabling of submodule function as required.

Operation and Configuration Tips

This section provides the operational tips and set-up options for the fault handler submodule.

Fault signals coming from pins are sampled and synced in the GPIO matrix. In order to guarantee the successful sampling of fault pulses, each pulse duration must be at least two APB clock cycles. The fault detection submodule will then sample fault signals by using PWM_clk. So, the duration of fault pulses coming from GPIO matrix must be at least one PWM_clk cycle. Differently put, regardless of the period relation between APB clock and PWM_clk, the width of fault signal pulses on pins must be at least equal to the sum of two APB clock cycles and one PWM_clk cycle.

Each level of fault signals, FAULT0 to FAULT2, can be used by the fault handler submodule to generate fault events (fault_event0 to fault_event2). Every fault event can be configured individually to provide CBC action, OST action, or none.

- **Cycle-by-Cycle (CBC) action:**

When CBC action is triggered, the state of PWMxA and PWMxB will be changed immediately according to the configuration of fields `MCPWM_FHx_A_CBC_U/D` and `MCPWM_FHx_B_CBC_U/D`. Different actions can be indicted when the PWM timer is incrementing or decrementing. Different CBC action interrupts can be triggered for different fault events. Status field `MCPWM_FHx_CBC_ON` indicates whether a CBC action is on or off. When the fault event is no longer present, CBC actions on PWMxA/B will be cleared at a specified point, which is either a D/UTEP or D/UTEZ event. Field `MCPWM_FHx_CBCPULSE` determines at which event PWMxA and PWMxB will be able to resume normal actions. Therefore, in this mode, the CBC action is cleared or refreshed upon every PWM cycle.

- **One-Shot (OST) action:**

When OST action is triggered, the state of PWMxA and PWMxB will be changed immediately, depending on the setting of fields `MCPWM_FHx_A_OST_U/D` and `MCPWM_FHx_B_OST_U/D`. Different actions can be configured when PWM timer is incrementing or decrementing. Different OST action interrupts can be triggered from different fault events. Status field `MCPWM_FHx_OST_ON` indicates whether an OST action is on or off. The OST actions on PWMxA/B are not automatically cleared when the fault event is no longer present. One-shot actions must be cleared manually by setting the rising edge of the `MCPWM_FHx_CLR_OST` bit.

32.3.4 Capture Submodule

32.3.4.1 Introduction

The capture submodule contains three complete capture channels. Channel inputs CAP0, CAP1 and CAP2 are sourced from the GPIO matrix. Thanks to the flexibility of the GPIO matrix, CAP0, CAP1 and CAP2 can be configured from any pin input. Multiple capture channels can be sourced from the same pin input, while prescaling for each channel can be set differently. Also, capture channels are sourced from different pins. This provides several options for handling capture signals by hardware in the background, instead of having them processed directly by the CPU. A capture submodule has the following independent key resources:

- One 32-bit timer (counter) which can be synchronized with the PWM timer, another submodule or software.
- Three capture channels, each equipped with a 32-bit time-stamp and a capture prescaler.
- Independent edge polarity (rising/falling edge) selection for any capture channel.
- Input capture signal prescaling (from 1 to 256).

- Interrupt capabilities on any of the three capture events.

32.3.4.2 Capture Timer

The capture timer is a 32-bit counter incrementing continuously. It is enabled by setting `MCPWM_CAP_TIMER_EN` to 1. Its operating clock source is `APB_CLK`. When `MCPWM_CAP_SYNCI_EN` is configured, the counter will be loaded with phase stored in register `MCPWM_CAP_TIMER_PHASE_REG` at the time of a sync event. Sync events can select from PWM timers sync-out, PWM module sync-in by configuring `MCPWM_CAP_SYNCI_SEL`. Sync event can also generate by setting `MCPWM_CAP_SYNC_SW`. The capture timer provides timing references for all three capture channels.

32.3.4.3 Capture Channel

The capture signal coming to a capture channel will be inverted first, if needed, and then prescaled. Each capture channel has a prescaler register of `MCPWM_CAPx_PRESCALE`. Finally, specified edges of preprocessed capture signal will trigger capture events. Setting `MCPWM_CAPx_EN` to enable a capture channel. The capture event occurs at the time selected by the `MCPWM_CAPx_MODE`. When a capture event occurs, the capture timer's value is stored in time-stamp register `MCPWM_CAP_CHx_REG`. Different interrupts can be generated for different capture channels at capture events. The edge that triggers a capture event is recorded in register `MCPWM_CAPx_EDGE`. The capture event can be also forced by software setting `MCPWM_CAPx_SW`.

32.4 Register Summary

The addresses in this section are relative to Motor Control PWM0 and Motor Control PWM1 base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
Prescaler configuration			
MCPWM_CLK_CFG_REG	PWM clock prescaler register	0x0000	R/W
PWM Timer 0 Configuration and status			
MCPWM_TIMER0_CFG0_REG	PWM timer0 period and update method configuration register	0x0004	R/W
MCPWM_TIMER0_CFG1_REG	PWM timer0 working mode and start/stop control configuration register	0x0008	R/W
MCPWM_TIMER0_SYNC_REG	PWM timer0 sync function configuration register	0x000C	R/W
MCPWM_TIMER0_STATUS_REG	PWM timer0 status register	0x0010	RO
PWM Timer 1 Configuration and Status			
MCPWM_TIMER1_CFG0_REG	PWM timer1 period and update method configuration register	0x0014	R/W
MCPWM_TIMER1_CFG1_REG	PWM timer1 working mode and start/stop control configuration register	0x0018	varies
MCPWM_TIMER1_SYNC_REG	PWM timer1 sync function configuration register	0x001C	R/W
MCPWM_TIMER1_STATUS_REG	PWM timer1 status register	0x0020	RO
PWM Timer 2 Configuration and status			
MCPWM_TIMER2_CFG0_REG	PWM timer2 period and update method configuration register	0x0024	R/W
MCPWM_TIMER2_CFG1_REG	PWM timer2 working mode and start/stop control configuration register	0x0028	varies
MCPWM_TIMER2_SYNC_REG	PWM timer2 sync function configuration register	0x002C	R/W
MCPWM_TIMER2_STATUS_REG	PWM timer2 status register	0x0030	RO
Common configuration for PWM timers			
MCPWM_TIMER_SYNCI_CFG_REG	Synchronization input selection for three PWM timers	0x0034	R/W
MCPWM_OPERATOR_TIMERSEL_REG	Select specific timer for PWM operators	0x0038	R/W
PWM Operator 0 Configuration and Status			
MCPWM_GEN0_STMP_CFG_REG	Transfer status and update method for time stamp registers A and B	0x003C	varies
MCPWM_GEN0_TSTMP_A_REG	PWM generator 0 shadow register for timer stamp A	0x0040	R/W
MCPWM_GEN0_TSTMP_B_REG	PWM generator 0 shadow register for timer stamp B	0x0044	R/W
MCPWM_GEN0_CFG0_REG	PWM generator 0 event T0 and T1 handling	0x0048	R/W
MCPWM_GEN0_FORCE_REG	Permissive to force PWM0A and PWM0B outputs by software	0x004C	R/W
MCPWM_GEN0_A_REG	Actions triggered by events on PWM0A	0x0050	R/W
MCPWM_GEN0_B_REG	Actions triggered by events on PWM0B	0x0054	R/W

Name	Description	Address	Access
MCPWM_DT0_CFG_REG	PWM generator 0 dead time type selection and configuration	0x0058	R/W
MCPWM_DT0_FED_CFG_REG	PWM generator 0 shadow register for falling edge delay (FED)	0x005C	R/W
MCPWM_DT0_RED_CFG_REG	PWM generator 0 shadow register for rising edge delay (RED)	0x0060	R/W
MCPWM_CARRIER0_CFG_REG	PWM generator 0 carrier enable and configuration	0x0064	R/W
MCPWM_FH0_CFG0_REG	Actions on PWM0A and PWM0B on trip events	0x0068	R/W
MCPWM_FH0_CFG1_REG	Software triggers for fault handler actions	0x006C	R/W
MCPWM_FH0_STATUS_REG	Status of fault events	0x0070	RO
PWM Operator 1 Configuration and Status			
MCPWM_GEN1_STMP_CFG_REG	Transfer status and update method for time stamp registers A and B	0x0074	varies
MCPWM_GEN1_TSTMP_A_REG	PWM generator 1 shadow register for timer stamp A	0x0078	R/W
MCPWM_GEN1_TSTMP_B_REG	PWM generator 1 shadow register for timer stamp B	0x007C	R/W
MCPWM_GEN1_CFG0_REG	PWM generator 1 event T0 and T1 handling	0x0080	R/W
MCPWM_GEN1_FORCE_REG	Permissive to force PWM1A and PWM1B outputs by software	0x0084	R/W
MCPWM_GEN1_A_REG	Actions triggered by events on PWM1A	0x0088	R/W
MCPWM_GEN1_B_REG	Actions triggered by events on PWM1B	0x008C	R/W
MCPWM_DT1_CFG_REG	PWM generator 1 dead time type selection and configuration	0x0090	R/W
MCPWM_DT1_FED_CFG_REG	PWM generator 1 shadow register for falling edge delay (FED)	0x0094	R/W
MCPWM_DT1_RED_CFG_REG	PWM generator 1 shadow register for rising edge delay (RED)	0x0098	R/W
MCPWM_CARRIER1_CFG_REG	PWM generator 1 carrier enable and configuration	0x009C	R/W
MCPWM_FH1_CFG0_REG	Actions on PWM1A and PWM1B trip events	0x00A0	R/W
MCPWM_FH1_CFG1_REG	Software triggers for fault handler actions	0x00A4	R/W
MCPWM_FH1_STATUS_REG	Status of fault events	0x00A8	RO
PWM Operator 2 Configuration and Status			
MCPWM_GEN2_STMP_CFG_REG	Transfer status and update method for time stamp registers A and B	0x00AC	varies
MCPWM_GEN2_TSTMP_A_REG	PWM generator 2 shadow register for timer stamp A	0x00B0	R/W
MCPWM_GEN2_TSTMP_B_REG	PWM generator 2 shadow register for timer stamp B	0x00B4	R/W
MCPWM_GEN2_CFG0_REG	PWM generator 2 event T0 and T1 handling	0x00B8	R/W
MCPWM_GEN2_FORCE_REG	Permissive to force PWM2A and PWM2B outputs by software	0x00BC	R/W

Name	Description	Address	Access
MCPWM_GEN2_A_REG	Actions triggered by events on PWM2A	0x00C0	R/W
MCPWM_GEN2_B_REG	Actions triggered by events on PWM2B	0x00C4	R/W
MCPWM_DT2_CFG_REG	PWM generator 2 dead time type selection and configuration	0x00C8	R/W
MCPWM_DT2_FED_CFG_REG	PWM generator 2 shadow register for falling edge delay (FED)	0x00CC	R/W
MCPWM_DT2_RED_CFG_REG	PWM generator 2 shadow register for rising edge delay (RED)	0x00D0	R/W
MCPWM_CARRIER2_CFG_REG	PWM generator 2 carrier enable and configuration	0x00D4	R/W
MCPWM_FH2_CFG0_REG	Actions on PWM2A and PWM2B trip events	0x00D8	R/W

32.5 Registers

The addresses in this section are relative to Motor Control PWM0 and Motor Control PWM1 base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 32.1. MCPWM_CLK_CFG_REG (0x0000)

(reserved)																MCPWM_CLK_PRESCALE								
31																8	7	0						
0 0																0x0								Reset

MCPWM_CLK_PRESCALE Period of PWM_clk = 6.25ns * (PWM_CLK_PRESCALE + 1). (R/W)

Register 32.2. MCPWM_TIMER0_CFG0_REG (0x0004)

(reserved)																MCPWM_TIMER0_PERIOD_UPMETHOD								MCPWM_TIMER0_PERIOD								MCPWM_TIMER0_PRESCALE							
31						26	25	24	23																8	7	0												
0 0 0 0 0 0						0 0		0xff								0x0								Reset															

MCPWM_TIMER0_PRESCALE Period of PT0_clk = Period of PWM_clk * (PWM_TIMER0_PRESCALE + 1). (R/W)

MCPWM_TIMER0_PERIOD Period shadow register of PWM timer0. (R/W)

MCPWM_TIMER0_PERIOD_UPMETHOD Update method for active register of PWM timer0 period.
0: immediate; 1: TEZ; 2: sync; 3: TEZ | sync. TEZ here and below means timer equal zero event.
(R/W)

Register 32.6. MCPWM_TIMER1_CFG0_REG (0x0014)

(reserved)						MCPWM_TIMER1_PERIOD_UPMETHOD						MCPWM_TIMER1_PERIOD						MCPWM_TIMER1_PRESCALE						
31						26	25	24	23							8	7				0			
0	0	0	0	0	0	0	0																	
												0xff						0x0						Reset

MCPWM_TIMER1_PRESCALE Period of $PT0_clk = \text{Period of PWM_clk} * (\text{PWM_timer1_PRESCALE} + 1)$. (R/W)

MCPWM_TIMER1_PERIOD Period shadow register of PWM timer1. (R/W)

MCPWM_TIMER1_PERIOD_UPMETHOD Update method for active register of PWM timer1 period, 0: immediate, 1: TEZ, 2: sync, 3: TEZ | sync. TEZ here and below means timer equal zero event. (R/W)

Register 32.7. MCPWM_TIMER1_CFG1_REG (0x0018)

(reserved)																MCPWM_TIMER1_MOD				MCPWM_TIMER1_START				
31																5	4	3	2			0		
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0									
																0x0				0x0				Reset

MCPWM_TIMER1_START PWM timer1 start and stop control. (R/W/SC)

- 0: if PWM timer1 starts, then stops at TEZ;
- 1: if timer1 starts, then stops at TEP;
- 2: PWM timer1 starts and runs on;
- 3: timer1 starts and stops at the next TEZ;
- 4: timer1 starts and stops at the next TEP.

TEP here and below means the event that happens when the timer equals to period.

MCPWM_TIMER1_MOD PWM timer1 working mode. 0: freeze; 1: increase mode; 2: decrease mode; 3: up-down mode. (R/W)

Register 32.10. MCPWM_TIMER2_CFG0_REG (0x0024)

(reserved)						MCPWM_TIMER2_PERIOD_UPMETHOD			MCPWM_TIMER2_PERIOD								MCPWM_TIMER2_PRESCALE		
31	26	25	24	23									8	7	0				
0	0	0	0	0	0	0xff								0x0			Reset		

MCPWM_TIMER2_PRESCALE Period of $PT0_clk = \text{Period of PWM_clk} * (\text{PWM_timer2_PRESCALE} + 1)$. (R/W)

MCPWM_TIMER2_PERIOD Period shadow register of PWM timer2. (R/W)

MCPWM_TIMER2_PERIOD_UPMETHOD Update method for active register of PWM timer2 period.
 0: immediate; 1: TEZ; 2: sync; 3: TEZ | sync. TEZ here and below means timer equal zero event.
 (R/W)

Register 32.11. MCPWM_TIMER2_CFG1_REG (0x0028)

(reserved)																MCPWM_TIMER2_MOD			MCPWM_TIMER2_START		
31																5	4	3	2	0	
0																0x0			0x0		Reset

MCPWM_TIMER2_START PWM timer2 start and stop control. (R/W/SC)

- 0: if PWM timer2 starts, then stops at TEZ;
- 1: if timer2 starts, then stops at TEP;
- 2: PWM timer2 starts and runs on;
- 3: timer2 starts and stops at the next TEZ;
- 4: timer2 starts and stops at the next TEP.

TEP here and below means the event that happens when the timer equals to period.

MCPWM_TIMER2_MOD PWM timer2 working mode. (R/W)

- 0: freeze;
- 1: increase mode;
- 2: decrease mode;
- 3: up-down mode.

Register 32.12. MCPWM_TIMER2_SYNC_REG (0x002C)

(reserved)										MCPWM_TIMER2_PHASE_DIRECTION										MCPWM_TIMER2_PHASE										MCPWM_TIMER2_SYNC_SEL					MCPWM_TIMER2_SYNC_SW					MCPWM_TIMER2_SYNCI_EN														
31										21										19										4					3					2					1					0				
0										0										0										0					0					0					0					Reset				

MCPWM_TIMER2_SYNCI_EN When set, timer reloading with phase on sync input event is enabled. (R/W)

MCPWM_TIMER2_SYNC_SW Toggling this bit will trigger a software sync. (R/W)

MCPWM_TIMER2_SYNCO_SEL PWM timer2 sync_out selection. 0: sync_in; 1: TEZ; 2: TEP. The sync_out will always generate when toggling the reg_timer2_sync_sw bit. (R/W)

MCPWM_TIMER2_PHASE Phase for timer reload on sync event. (R/W)

MCPWM_TIMER2_PHASE_DIRECTION Configure the PWM timer2's direction when timer2 mode is up-down mode. 0: increase; 1: decrease. (R/W)

Register 32.13. MCPWM_TIMER2_STATUS_REG (0x0030)

(reserved)										MCPWM_TIMER2_DIRECTION										MCPWM_TIMER2_VALUE																																							
31										17										16										15										0																			
0										0										0										0										0										Reset									

MCPWM_TIMER2_VALUE Current value of PWM timer2 counter. (RO)

MCPWM_TIMER2_DIRECTION Current direction of PWM timer2 counter. 0: increment; 1: decrement. (RO)

Register 32.14. MCPWM_TIMER_SYNCI_CFG_REG (0x0034)

(reserved)												MCPWM_EXTERNAL_SYNCI2_INVERT			MCPWM_EXTERNAL_SYNCI1_INVERT			MCPWM_EXTERNAL_SYNCI0_INVERT			MCPWM_TIMER2_SYNCISEL			MCPWM_TIMER1_SYNCISEL			MCPWM_TIMER0_SYNCISEL		
31											12	11	10	9	8			6	5			3	2			0	Reset		
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		

MCPWM_TIMER0_SYNCISEL Select sync input for PWM timer0. (R/W)

- 1: PWM timer0 sync_out;
- 2: PWM timer1 sync_out;
- 3: PWM timer2 sync_out;
- 4: SYNC0 from GPIO matrix;
- 5: SYNC1 from GPIO matrix;
- 6: SYNC2 from GPIO matrix;
- Other values: no sync input selected.

MCPWM_TIMER1_SYNCISEL Select sync input for PWM timer1. (R/W)

- 1: PWM timer0 sync_out;
- 2: PWM timer1 sync_out;
- 3: PWM timer2 sync_out;
- 4: SYNC0 from GPIO matrix;
- 5: SYNC1 from GPIO matrix;
- 6: SYNC2 from GPIO matrix;
- Other values: no sync input selected.

33 Remote Control Peripheral (RMT)

33.1 Overview

The RMT module is designed to send and receive infrared remote control signals. A variety of remote control protocols can be encoded/decoded via software based on the RMT module. The RMT module converts pulse codes stored in the module's built-in RAM into output signals, or converts input signals into pulse codes and stores them in RAM. In addition, the RMT module optionally modulates its output signals with a carrier wave, or optionally demodulates and filters its input signals.

The RMT module has eight channels, numbered from zero to seven. Each channel is able to independently transmit or receive signals.

- Channel 0 ~ 3 (TX channel) are dedicated to sending signals.
- Channel 4 ~ 7 (RX channel) are dedicated to receiving signals.

Each TX/RX channel is controlled by a dedicated set of registers with the same functionality. Channel 3 and channel 7 support DMA access, so the two channels also have a set of DMA-related control and status registers. Registers for each TX channel are indicated by n which is used as a placeholder for the channel number, and m for each RX channel.

33.2 Features

- Four TX channels
- Four RX channels
- Support multiple channels (programmable) transmitting data simultaneously
- Eight channels share a 384 x 32-bit RAM
- Support modulation on TX pulses
- Support filtering and demodulation on RX pulses
- Wrap TX mode
- Wrap RX mode
- Continuous TX mode
- DMA access for TX mode on channel 3
- DMA access for RX mode on channel 7

33.3 Functional Description

33.3.1 Architecture

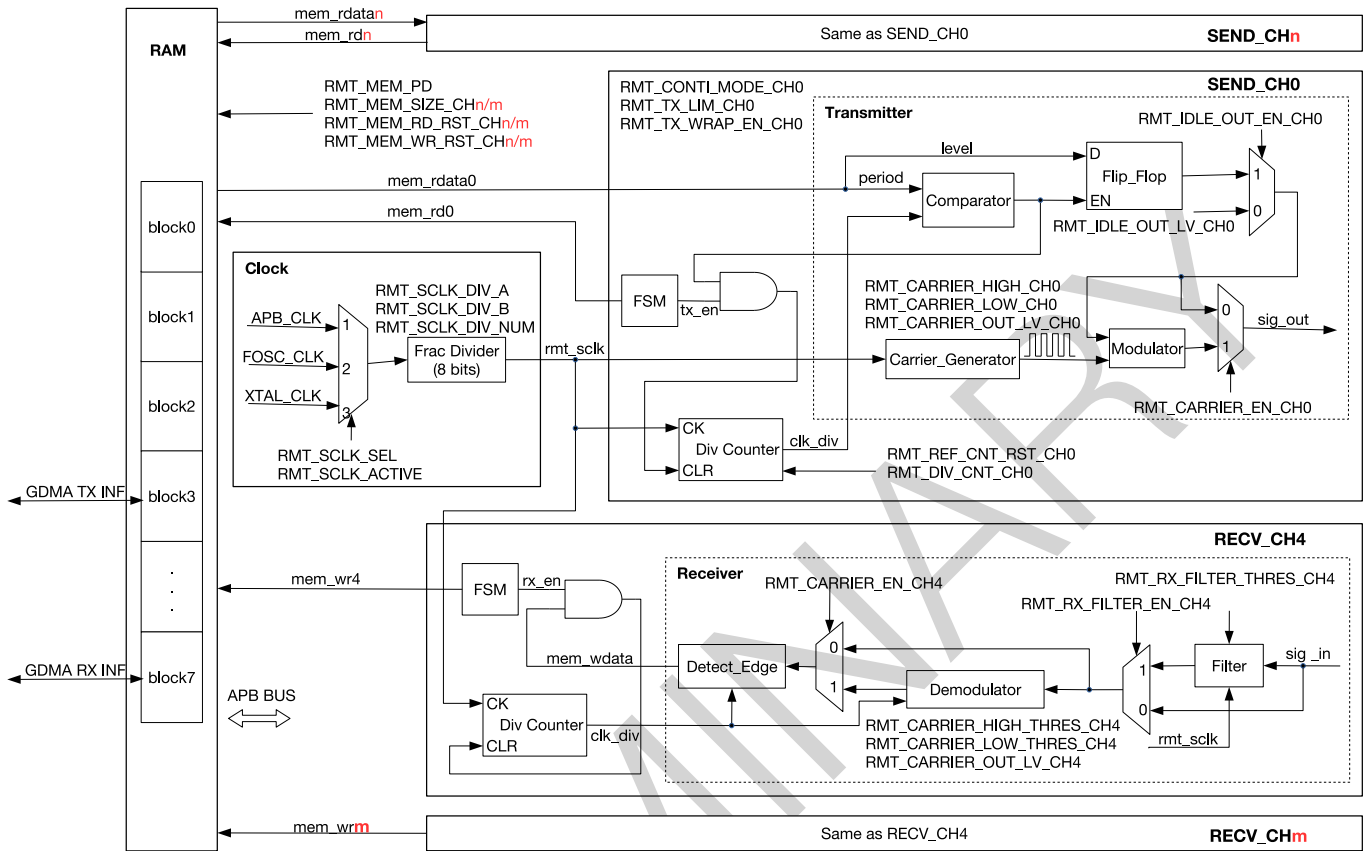

Figure 33-1. RMT Architecture

As shown in Figure 33-1, each TX channel (SEND_CH n) has:

- 1 x clock divider counter (Div Counter)
- 1 x state machine (FSM)
- 1 x transmitter

Each RX channel (RECV_CH m) has:

- 1 x clock divider counter (Div Counter)
- 1 x state machine (FSM)
- 1 x receiver

The eight channels share a 384 x 32-bit RAM.

33.3.2 RAM

33.3.2.1 RAM Architecture

Figure 33-2 shows the format of pulse code in RAM. Each pulse code contains a 16-bit entry with two fields: “level” and “period”. “level” (0 or 1) indicates a low-/high-level value was received or is going to be sent, while “period” points out the number of clock cycles (see Figure 33-1 clk_div) that the level lasts for.

Figure 33-2. Format of Pulse Code in RAM

The minimum value for the period is zero (0) and is interpreted as a transmission end-marker. For a non-zero period (i.e., not an end-marker), its value is limited by APB clock and RMT clock according to the equation below:

$$3 \times T_{apb_clk} + 5 \times T_{rmt_sclk} < period \times T_{clk_div} \quad (1)$$

Note:

According to the equation above and the frequency of `rmt_sclk`, the pulse width (i.e. $period \times T_{clk_div}$) able to be captured by RMT is limited as follows:

- the minimum value of pulse width should be larger than $(3 \times T_{apb_clk} + 5 \times T_{rmt_sclk})$.
- the maximum value of pulse width should be smaller than or equal to (the maximum period \times the maximum T_{clk_div}), i.e., $((2^{15} - 1) \times \text{the maximum } T_{rmt_sclk} \times 256)$.

For more information about `rmt_sclk` frequency, or APB_CLK frequency, see Section 33.3.3, or Chapter 6 *Reset and Clock*.

33.3.2.2 Use of RAM

The RAM is divided into eight 48 x 32-bit blocks. By default, each channel uses one block (block 0 for channel 0, block 1 for channel 1, and so on).

If the data size of one single transfer is larger than one block size of TX channel n or RX channel m , users can configure the channel:

- to enable `wrap mode` by setting `RMT_MEM_TX/RX_WRAP_EN_CHn/m`.
- or to use more blocks by configuring `RMT_MEM_SIZE_CHn/m`.

Setting `RMT_MEM_SIZE_CHn/m > 1` allows channel n/m to use the memory of subsequent channels, block $(n/m) \sim$ block $(n/m + RMT_MEM_SIZE_CHn/m - 1)$. If so, the subsequent channels $n/m + 1 \sim n/m + RMT_MEM_SIZE_CHn/m - 1$ can not be used once their RAM blocks are occupied. For example, if channel 0 is configured to use block 0 and block 1, then channel 1 can not be used due to its block being occupied. But channel 2 and channel 3 are not affected, and can be used normally.

Note that the RAM used by each channel is mapped from low address to high address. Under such mapping, channel 0 is able to use the RAM blocks for channels 1, 2 ... and 7 by setting `RMT_MEM_SIZE_CH0`, but channel 7 can not use the blocks for channels 0, 1, ... or 6. Therefore, the maximum value of `RMT_MEM_SIZE_CHn` should not exceed $(8 - n)$ and the maximum of `RMT_MEM_SIZE_CHm` should not exceed $(8 - m)$.

The RMT RAM can be accessed via the APB bus, read by a transmitting channel, and written to by a receiving channel. To avoid any possible access conflict between the receiver writing RAM and the APB bus reading RAM, RMT can be configured to designate the block's owner, be it the receiver or APB bus, by configuring `RMT_MEM_OWNER_CH m` . If this ownership is violated, a flag signal `RMT_MEM_OWNER_ERR_CH m` will be generated.

When the RMT module is inactive, the RAM can be put into low-power mode by setting `RMT_MEM_FORCE_PD`.

33.3.2.3 RAM Access

APB bus is able to access RAM in FIFO mode and in NONFIFO (Direct Address) mode, depending on the configuration of `RMT_APB_FIFO_MASK`:

- 1: use NONFIFO mode;
- 0: use FIFO mode.

Channels 3 and 7 also support DMA access.

FIFO Mode

In FIFO mode, the APB reads data from or writes data to RAM via a fixed address stored in `RMT_CH n /mDATA_REG`.

NONFIFO Mode

In NONFIFO mode, the APB writes data to or reads data from a continuous address range.

- The write-starting address of TX channel n is: RMT base address + $0x800 + (n - 1) \times 48$. The access address for the second data and the following data are RMT base address + $0x800 + (n - 1) \times 48 + 0x4$, and so on, incremented by $0x4$.
- The read-starting address of RX channel m is: RMT base address + $0x8c0 + (m - 1) \times 48$. The access address for the second data and the following data are RMT base address + $0x8c0 + (m - 1) \times 48 + 0x4$, and so on, incremented by $0x4$.

DMA Mode

Channel 3 also supports DMA access. If `RMT_DMA_ACCESS_EN_CH3` is set, RAM of channel 3 only allows DMA access. FIFO access or NONFIFO access to channel 3 by the APB bus are forbidden, otherwise **unpredictable consequences may occur**.

To ensure correct data transmission,

1. DMA should be started first.
2. RMT can only start sending data after DMA channel gets data ready, otherwise, unexpected data may be sent.

In **normal TX mode**, when the RAM of channel 3 is fully written by DMA, an `RMT_APB_MEM_WR_ERR_CH3` interrupt is triggered. Setting `RMT_MEM_TX_WRAP_EN_CH3` allows channel 3 to transmit more data than one block can fit, with no software operation needed.

Channel 7 also supports DMA access. If `RMT_DMA_ACCESS_EN_CH7` is set, the RAM of channel 7 is allowed to send data to DMA. Note in this mode, channel 7's RAM can also be accessed by APB via NONFIFO mode.

In *normal RX mode*, when the size of data read by DMA from channel 7 is equal to its RAM size, an `RMT_APB_MEM_RD_ERR_CH7` is triggered and the subsequent data is discarded. If `RMT_MEM_RX_WRAP_EN_CH7` is set, data of more than one block size can be received with no software wrap operation needed. If channel 7's RAM is full but the DMA still does not start receiving data from the channel, the newly received data by this channel will replace the previous data.

Note:

When channel 7 receives an end-marker, a DMA `in_suc_eof` interrupt is generated. Two bytes are written to DMA if the `period[14:0]` is 0, and four bytes to DMA if the `period[30:16]` is 0.

33.3.3 Clock

The clock source of RMT can be `APB_CLK`, `FOSC_CLK`, or `XTAL_CLK`, depending on the configuration of `RMT_SCLK_SEL`. RMT clock can be enabled by setting `RMT_SCLK_ACTIVE`. RMT working clock is obtained by dividing the selected clock source with a fractional divider, see Figure 33-1. The divider is:

$$RMT_SCLK_DIV_NUM + 1 + RMT_SCLK_DIV_A/RMT_SCLK_DIV_B$$

For more information, see Chapter 6 *Reset and Clock*. `RMT_DIV_CNT_CHn/m` is used to configure the divider coefficient of internal clock divider for RMT channels. The coefficient is normally equal to the value of `RMT_DIV_CNT_CHn/m`, except value 0 that represents divider 256. The clock divider can be reset by setting `RMT_REF_CNT_RST_CHn/m`. The clock generated from the divider can be used by the counter (see Figure 33-1).

33.3.4 Transmitter

Note:

Updating the configuration described in this and subsequent sections requires to set `RMT_CONF_UPDATE_CHn` first, see Section 33.3.6.

33.3.4.1 Normal TX Mode

When `RMT_TX_START_CHn` is set, the transmitter of channel *n* starts reading and sending pulse codes from the starting address of its RAM block. The codes are sent starting from low-address entry. When an end-marker (a zero period) is encountered, the transmitter stops the transmission, returns to idle state and generates an `RMT_CHn_TX_END_INT` interrupt. Setting `RMT_TX_STOP_CHn` to 1 also stops the transmission and immediately sets the transmitter back to idle. The output level of a transmitter in idle state is determined by the "level" field of the end-marker or by the content of `RMT_IDLE_OUT_LV_CHn`, depending on the configuration of `RMT_IDLE_OUT_EN_CHn`:

- 0: the level in idle state is determined by the "level" field of the end-marker.
- 1: the level is determined by `RMT_IDLE_OUT_LV_CHn`.

33.3.4.2 Wrap TX Mode

To transmit more pulse codes than can be fitted in the channel's RAM, users can enable wrap mode by setting `RMT_MEM_TX_WRAP_EN_CHn`. In wrap mode, the transmitter sends the data from RAM in loops till an end-marker is encountered. For example, if `RMT_MEM_SIZE_CHn = 1`, the transmitter starts sending data from the address $48 * n$, and then the data from higher RAM address. Once the transmitter finishes sending the data from $(48 * (n + 1) - 1)$, it continues sending data from $48 * n$ again till encounters an end-marker. Wrap mode is also applicable for `RMT_MEM_SIZE_CHn > 1`.

When the size of transmitted pulse codes is larger than or equal to the value set by `RMT_TX_LIM_CHn`, an `RMT_CHn_TX_THR_EVENT_INT` interrupt is generated. In wrap mode, `RMT_TX_LIM_CHn` can be set to a half or a fraction of the size of the channel's RAM block. When an `RMT_CHn_TX_THR_EVENT_INT` interrupt is detected by software, the already used RAM region can be updated by new pulse codes. In such way, the transmitter can seamlessly send unlimited pulse codes in wrap mode.

Note:

If RAM is accessed by DMA mode, more pulse codes than one block size can be transmitted with no additional operation needed. If accessed by APB bus, wrap mode has to be enabled via software to send more data than one block size.

33.3.4.3 TX Modulation

Transmitter output can be modulated with a carrier wave by setting `RMT_CARRIER_EN_CHn`. The carrier waveform is configurable. In a carrier cycle, the high level lasts for $(RMT_CARRIER_HIGH_CHn + 1)$ `rmt_sclk` cycles, while the low level lasts for $(RMT_CARRIER_LOW_CHn + 1)$ `rmt_sclk` cycles. When `RMT_CARRIER_OUT_LV_CHn` is set, carrier wave is added on the high-level of output signals; while `RMT_CARRIER_OUT_LV_CHn` is cleared, carrier wave is added on the low-level of output signals. Carrier wave can be added on all output signals during modulation, or just added on valid pulse codes (the data stored in RAM), which can be set by configuring `RMT_CARRIER_EFF_EN_CHn`:

- 0: add carrier wave on all output signals.
- 1: add carrier wave only on valid signals.

33.3.4.4 Continuous TX Mode

The continuous TX mode can be enabled by setting `RMT_TX_CONTI_MODE_CHn`. In this mode, the transmitter sends the pulse codes from RAM in loops:

- If an end-marker is encountered, the transmitter starts transmitting from the first data of the channel's RAM again.
- If no end-marker is encountered, the transmitter starts transmitting from the first data again after the last data is transmitted.

If `RMT_TX_LOOP_CNT_EN_CHn` is set, the loop counting is incremented by 1 each time an end-marker is encountered. If the counting reaches the value set by `RMT_TX_LOOP_NUM_CHn`, an `RMT_CHn_TX_LOOP_INT` interrupt is generated. If `RMT_LOOP_STOP_EN_CHn` is set, the transmission stops immediately once an `RMT_CHn_TX_LOOP_INT` interrupt is generated, otherwise, the transmission will continue. In an end-maker, if its `period[14:0]` is 0, then the period of the previous data must satisfy:

$$6 \times T_{apb_clk} + 12 \times T_{rmt_sclk} < period \times T_{clk_div} \quad (2)$$

The period of the other data only need to satisfy [relation \(1\)](#).

33.3.4.5 Simultaneous TX Mode

RMT module supports multiple channels transmitting data simultaneously. To use this function, follow the steps below:

1. Configure `RMT_TX_SIM_CH n` to choose which multiple channels are used to transmit data simultaneously.
2. Set `RMT_TX_SIM_EN` to enable this transmission mode.
3. Set `RMT_TX_START_CH n` for each selected channel, to start data transmitting.

The transmission starts once the final channel is configured. RMT module also supports simultaneous transmission of channels 0 ~ 2's RAM accessed by APB bus and channel 3's RAM accessed by DMA.

33.3.5 Receiver

33.3.5.1 Normal RX Mode

The receiver of channel m is controlled by `RMT_RX_EN_CH m` :

- 1: the receiver starts working.
- 0: the receiver stops receiving data.

When the receiver becomes active, it starts counting from the first edge of the signal, detecting signal levels and counting clock cycles the level lasts for. Each cycle count (period) is then written back to RAM together with the level information (level). When the receiver detects no change in a signal level for a number of clock cycles more than the value set by `RMT_IDLE_THRES_CH m` , the receiver will stop receiving data, return to idle state, and generate an `RMT_CH m _RX_END_INT` interrupt. Please note that `RMT_IDLE_THRES_CH m` should be configured to a maximum value according to your application, otherwise a valid received level may be mistaken as a level in idle state. If the RAM space of this RX channel is used up by the received data, the receiver stops receiving data, and an `RMT_CH n _ERR_INT` interrupt is triggered by RAM FULL event.

33.3.5.2 Wrap RX Mode

To receive more pulse codes than can be fitted in the channel's RAM, users can enable wrap mode for channel m by configuring `RMT_MEM_RX_WRAP_EN_CH m` . But if RAM is accessed by DMA mode, more pulse codes than one block size can be received with no additional operation needed. If accessed by APB bus, wrap mode has to be enabled to send more data than one block size. In wrap mode, the receiver stores the received data to RAM space of this channel in loops. Receiving ends, when the receiver detects no change in a signal level for a number of clock cycles more than the value set by `RMT_IDLE_THRES_CH m` . The receiver returns to idle state and generates an `RMT_CH m _RX_END_INT` interrupt. For example, if `RMT_MEM_SIZE_CH m` is set to 1, the receiver starts receiving data and stores the data to address $48 * m$, and then to higher RAM address. When the receiver finishes storing the received data to $(48 * (m + 1) - 1)$, the receiver continues receiving data and storing data to the address $48 * m$ again, no change is detected on a signal level for more than `RMT_IDLE_THRES_CH m` clock cycles. Wrap mode is also applicable for `RMT_MEM_SIZE_CH m` > 1.

An `RMT_CH m _RX_THR_EVENT_INT` interrupt is generated when the size of received pulse codes is larger than or equal to the value set by `RMT_CH m _RX_LIM_REG`. In wrap mode, `RMT_CH m _RX_LIM_REG` can be set to a

half or a fraction of the size of the channel's RAM block. When an `RMT_CH m _RX_THR_EVENT_INT` interrupt is detected, the already used RAM region can be updated by subsequent data.

33.3.5.3 RX Filtering

Users can enable the receiver to filter input signals by setting `RMT_RX_FILTER_EN_CH m` for channel m . The filter samples input signals continuously, and detects the signals which remain unchanged for a continuous `RMT_RX_FILTER_THRES_CH m` `rmt_sclk` cycles as valid, otherwise, the signals will be detected as invalid. Only the valid signals can pass through this filter. The filter removes pulses with a length of less than `RMT_RX_FILTER_THRES_CH m` `rmt_sclk` cycles.

33.3.5.4 RX Demodulation

Users can enable RX demodulation on input signals or on filtered signals by setting `RMT_CARRIER_EN_CH m` . RX demodulation can be applied to high-level carrier wave or low-level carrier wave, depending on the configuration of `RMT_CARRIER_OUT_LV_CH m` :

- 1: demodulate high-level carrier wave
- 0: demodulate low-level carrier wave

Users can configure `RMT_CARRIER_HIGH_THRES_CH m` and `RMT_CARRIER_LOW_THRES_CH m` to set the thresholds to demodulate high-level carrier or low-level carrier. If the high-level of a signal lasts for less than `RMT_CARRIER_HIGH_THRES_CH m` `clk_div` cycles, or the low-level lasts for less than `RMT_CARRIER_LOW_THRES_CH m` `clk_div` cycles, such level is detected as a carrier and then is filtered out.

33.3.6 Configuration Update

To update RMT registers configuration, please set `RMT_CONF_UPDATE_CH n / m` for each channel first. All the bits/fields listed in the second column of Table 33-1 should follow this rule.

Table 33-1. Configuration Update

Register	Bit/Field Configuration Update

RMT_REF_CNT_RST_REG	RMT_REF_CNT_RST_CH m

33.4 Interrupts

- RMT_CH n/m _ERR_INT: triggered when channel n/m does not read or write data correctly. For example, the receiver still tries to write data into RAM when the RAM is full. Or the transmitter still tries to read data from RAM when the RAM is empty.
- RMT_CH n _TX_THR_EVENT_INT: triggered when the amount of data the transmitter has sent matches the value of RMT_CH n _TX_LIM_REG.
- RMT_CH m _RX_THR_EVENT_INT: triggered each time when the amount of data received by the receiver reaches the value set in RMT_CH m _RX_LIM_REG.
- RMT_CH n _TX_END_INT: triggered when the transmitter has finished transmitting signals.
- RMT_CH m _RX_END_INT: triggered when the receiver has finished receiving signals.
- RMT_CH n _TX_LOOP_INT: triggered when the loop counting reaches the value set by RMT_TX_LOOP_NUM _CH n in continuous TX mode.
- RMT_CH3_DMA_ACCESS_FAIL_INT: triggered when the result of (the entries written to channel 3's RAM - the entries transmitted by channel 3) is larger than channel 3's RAM size, but DAM keeps writing data to this channel.
- RMT_CH7_DMA_ACCESS_FAIL_INT: triggered when the result of (the entries received by channel 7's RAM - the entries read by DMA) is larger than channel 7's RAM size, but channel 7 keeps receiving data.

33.5 Register Summary

The addresses in this section are relative to RMT base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
FIFO R/W Register			

Name	Description	Address	Access
RMT_CH0DATA_REG	The read and write data register for channel 0 by APB FIFO access	0x0000	RO
RMT_CH1DATA_REG	The read and write data register for channel 1 by APB FIFO access	0x0004	RO
RMT_CH2DATA_REG	The read and write data register for channel 2 by APB FIFO access	0x0008	RO
RMT_CH3DATA_REG	The read and write data register for channel 3 by APB FIFO access	0x000C	RO
RMT_CH4DATA_REG	The read and write data register for channel 4 by APB FIFO access	0x0010	RO
RMT_CH5DATA_REG	The read and write data register for channel 5 by APB FIFO access	0x0014	RO
RMT_CH6DATA_REG	The read and write data register for channel 6 by APB FIFO access	0x0018	RO
RMT_CH7DATA_REG	The read and write data register for channel 7 by APB FIFO access	0x001C	RO
Configuration Registers			
RMT_CH0CONF0_REG	Configuration register 0 for channel 0	0x0020	varies
RMT_CH1CONF0_REG	Configuration register 0 for channel 1	0x0024	varies
RMT_CH2CONF0_REG	Configuration register 0 for channel 2	0x0028	varies
RMT_CH3CONF0_REG	Configuration register 0 for channel 3	0x002C	varies
RMT_CH4CONF0_REG	Configuration register 0 for channel 4	0x0030	R/W
RMT_CH4CONF1_REG	Configuration register 1 for channel 4	0x0034	varies
RMT_CH5CONF0_REG	Configuration register 0 for channel 5	0x0038	R/W
RMT_CH5CONF1_REG	Configuration register 1 for channel 5	0x003C	varies
RMT_CH6CONF0_REG	Configuration register 0 for channel 6	0x0040	R/W
RMT_CH6CONF1_REG	Configuration register 1 for channel 6	0x0044	varies
RMT_CH7CONF0_REG	Configuration register 0 for channel 7	0x0048	R/W
RMT_CH7CONF1_REG	Configuration register 1 for channel 7	0x004C	varies
RMT_CH4_RX_CARRIER_RM_REG	Demodulation register for channel 4	0x0090	R/W
RMT_CH5_RX_CARRIER_RM_REG	Demodulation register for channel 5	0x0094	R/W
RMT_CH6_RX_CARRIER_RM_REG	Demodulation register for channel 6	0x0098	R/W
RMT_CH7_RX_CARRIER_RM_REG	Demodulation register for channel 7	0x009C	R/W
RMT_SYS_CONF_REG	Configuration register for RMT APB	0x00C0	R/W
RMT_REF_CNT_RST_REG	Reset register for RMT clock divider	0x00C8	WT
Status Registers			
RMT_CH0STATUS_REG	Channel 0 status register	0x0050	RO
RMT_CH1STATUS_REG	Channel 1 status register	0x0054	RO
RMT_CH2STATUS_REG	Channel 2 status register	0x0058	RO
RMT_CH3STATUS_REG	Channel 3 status register	0x005C	RO
RMT_CH4STATUS_REG	Channel 4 status register	0x0060	RO
RMT_CH5STATUS_REG	Channel 5 status register	0x0064	RO
RMT_CH6STATUS_REG	Channel 6 status register	0x0068	RO

Name	Description	Address	Access
RMT_CH7STATUS_REG	Channel 7 status register	0x006C	RO
Interrupt Registers			
RMT_INT_RAW_REG	Raw interrupt status register	0x0070	R/WTC/SS
RMT_INT_ST_REG	Masked interrupt status register	0x0074	RO
RMT_INT_ENA_REG	Interrupt enable register	0x0078	R/W
RMT_INT_CLR_REG	Interrupt clear register	0x007C	WT
Carrier Wave Duty Cycle Registers			
RMT_CH0CARRIER_DUTY_REG	Duty duty configuration register for channel 0	0x0080	R/W
RMT_CH1CARRIER_DUTY_REG	Duty duty configuration register for channel 1	0x0084	R/W
RMT_CH2CARRIER_DUTY_REG	Duty duty configuration register for channel 2	0x0088	R/W
RMT_CH3CARRIER_DUTY_REG	Duty duty configuration register for channel 3	0x008C	R/W
TX Event Configuration Registers			
RMT_CH0_TX_LIM_REG	Configuration register for channel 0 TX event	0x00A0	varies
RMT_CH1_TX_LIM_REG	Configuration register for channel 1 TX event	0x00A4	varies
RMT_CH2_TX_LIM_REG	Configuration register for channel 2 TX event	0x00A8	varies

RMT_CH5_RX_LIM_REG	Configuration register for channel 5 RX event	0x00B4	R/W
RMT_CH6_RX_LIM_REG	Configuration register for channel 6 RX event	0x00B8	R/W
RMT_CH7_RX_LIM_REG	Configuration register for channel 7 RX event	0x00BC	R/W
Version Register			
RMT_DATE_REG	Version control register	0x00CC	R/W

33.6 Registers

The addresses in this section are relative to RMT base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 33.1. RMT_CH n DATA_REG (n : 0-3) (0x0000+0x4* n)

RMT_CH n DATA Read and write data for channel n via APB FIFO. (RO)

Register 33.2. RMT_CH m DATA_REG (m = 4, 5, 6, 7) (0x0010, 0x0014, 0x0018, 0x001C)

RMT_CH m DATA Read and write data for channel m via APB FIFO. (RO)

Register 33.3. RMT_CH n CONF0_REG (n : 0-3) (0x0020+0x4* n)

Continued from the previous page...

RMT_CARRIER_EN_CH n This is the carrier modulation enable-bit for channel n . 1: Add carrier modulation on the output signal. 0: No carrier modulation is added on output signal. (R/W)

RMT_CARRIER_OUT_LV_CH n This bit is used to configure the position of carrier wave for channel n . (R/W)

1'h0: add carrier wave on low level.

1'h1: add carrier wave on high level.

RMT_CONF_UPDATE_CH n Synchronization bit for channel n (WT)

RMT_DMA_ACCESS_EN_CH3 (Reserved for channel 0 - 2) DMA access enable bit for channel 3. (R/W)

Register 33.4. RMT_CH m CONF0_REG ($m = 4, 5, 6, 7$) (0x0030, 0x0038, 0x0040, 0x0048)

(reserved)		RMT_CARRIER_OUT_LV_CH m		RMT_CARRIER_EN_CH m		RMT_MEM_SIZE_CH m		RMT_DMA_ACCESS_EN_CH7 (reserved for $m:4-6$)		RMT_IDLE_THRES_CH m		RMT_DIV_CNT_CH m	
31	30	29	28	27	24	23	22	8	7	0			
0	0	1	1	0x1		0	0x7ff		0x2		Reset		

RMT_DIV_CNT_CH m This field is used to configure the clock divider of channel m . (R/W)

RMT_IDLE_THRES_CH m This field is used to configure RX threshold. When no edge is detected on the input signal for continuous clock cycles longer than this field value, the receiver stops receiving data. (R/W)

RMT_DMA_ACCESS_EN_CH7 (Reserved for channel 4 - 6) DMA access enable bit for channel 7. (R/W)

RMT_MEM_SIZE_CH m This field is used to configure the maximum number of memory blocks allocated to channel m . (R/W)

RMT_CARRIER_EN_CH m This is the carrier demodulation enable-bit for channel m . 1: enable carrier demodulation for input signal. 0: disable carrier modulation for input signal. (R/W)

RMT_CARRIER_OUT_LV_CH m This bit is used to configure the position of carrier demodulation for channel m . (R/W)

1'h0: demodulate low-level carrier wave.

1'h1: demodulate high-level carrier wave.

Register 33.5. RMT_CH m CONF1_REG ($m = 4, 5, 6, 7$) (0x0034, 0x003C, 0x0044, 0x004C)

(reserved)																RMT_CONF_UPDATE_CH m (reserved)			RMT_MEM_RX_WRAP_EN_CH m			RMT_RX_FILTER_THRES_CH m			RMT_RX_FILTER_EN_CH m			RMT_MEM_OWNER_CH m			RMT_APB_MEM_RST_CH m			RMT_MEM_WR_RST_CH m			RMT_RX_EN_CH m		
31													16	15	14	13	12				5	4	3	2	1	0													
0 0 0 0 0 0 0 0 0 0 0 0												0	0	0	0xf			0	1	0	0	0	0	Reset															

RMT_RX_EN_CH m Set this bit to enable the receiver to start receiving data on channel m . (R/W)

RMT_MEM_WR_RST_CH m Set this bit to reset RAM write address accessed by the receiver for channel m . (WT)

RMT_APB_MEM_RST_CH m Set this bit to reset RAM W/R address accessed by APB FIFO for channel m . (WT)

RMT_MEM_OWNER_CH m This bit marks the ownership of channel m 's RAM block. (R/W/SC)

1'h1: Receiver is using the RAM.

1'h0: APB bus is using the RAM.

RMT_RX_FILTER_EN_CH m Set this bit to enable the receiver's filter for channel m . (R/W)

RMT_RX_FILTER_THRES_CH m When receiving data, the receiver ignores the input pulse when its width is shorter than this register value in units of rmt_sclk cycles. (R/W)

RMT_MEM_RX_WRAP_EN_CH m Set this bit to enable wrap RX mode for channel m . In this mode, if the RX data size is larger than channel m 's RAM block size, the receiver stores the RX data from the first address to the last address in loops. (R/W)

RMT_CONF_UPDATE_CH m Synchronization bit for channel m . (WT)

Register 33.6. RMT_CH m _RX_CARRIER_RM_REG ($m = 4, 5, 6, 7$) (0x0090, 0x0094, 0x0098, 0x009C)

<i>RMT_CARRIER_HIGH_THRES_CHm</i>																<i>RMT_CARRIER_LOW_THRES_CHm</i>																																															
31																16																15																0															
0x00																0x00																Reset																															

RMT_CARRIER_LOW_THRES_CH m The low level period in a carrier modulation mode is (RMT_CARRIER_LOW_THRES_CH m + 1) for channel m . (R/W)

RMT_CARRIER_HIGH_THRES_CH m The high level period in a carrier modulation mode is (RMT_CARRIER_HIGH_THRES_CH m + 1) for channel m . (R/W)

Register 33.7. RMT_SYS_CONF_REG (0x00C0)

<i>RMT_CLK_EN</i>				<i>(reserved)</i>				<i>RMT_SCLK_ACTIVE</i>				<i>RMT_SCLK_SEL</i>				<i>RMT_SCLK_DIV_B</i>				<i>RMT_SCLK_DIV_A</i>				<i>RMT_SCLK_DIV_NUM</i>				<i>RMT_MEM_FORCE_PU</i>				<i>RMT_MEM_FORCE_PD</i>				<i>RMT_MEM_CLK_FORCE_ON</i>				<i>RMT_APB_FIFO_MASK</i>																							
31				30				27				26				25				24				23				18				17				12				11				4				3				2				1				0			
0				0				0				0				1				0x1				0x0				0x0				0x1				0				0				0				0				Reset											

RMT_APB_FIFO_MASK 1'h1: Access memory directly (NONFIFO mode). 1'h0: Access memory by FIFO (FIFO mode). (R/W)

RMT_MEM_CLK_FORCE_ON Set this bit to enable the clock for RMT memory. (R/W)

RMT_MEM_FORCE_PD Set this bit to power down RMT memory. (R/W)

RMT_MEM_FORCE_PU 1: Disable the power-down function of RMT memory in Light-sleep. 0: Power down RMT memory when RMT is in Light-sleep mode. (R/W)

RMT_SCLK_DIV_NUM The integral part of the fractional divider. (R/W)

RMT_SCLK_DIV_A The numerator of the fractional part of the fractional divider. (R/W)

RMT_SCLK_DIV_B The denominator of the fractional part of the fractional divider. (R/W)

RMT_SCLK_SEL Choose the clock source of rmt_sclk. 1: APB_CLK; 2: FOSC_CLK; 3: XTAL_CLK. (R/W)

RMT_SCLK_ACTIVE rmt_sclk switch. (R/W)

RMT_CLK_EN The enable signal of RMT register clock gate. 1: Power up the drive clock of registers. 0: Power down the drive clock of registers. (R/W)

Register 33.10. RMT_CH m STATUS_REG ($m = 4, 5, 6, 7$) (0x0060, 0x0064, 0x0068, 0x006C)

(reserved)				RMT_APB_MEM_RD_ERR_CH m				RMT_APB_MEM_RADDR_CH m				(reserved)				RMT_MEM_WADDR_EX_CH m

Reset

RMT_MEM_WADDR_EX_CH m This field records the memory address offset when receiver of channel m is using the RAM. (RO)

RMT_APB_MEM_RADDR_CH m This field records the memory address offset when reads RAM over APB bus. (RO)

RMT_STATE_CH m This field records the FSM status of channel m . (RO)

RMT_MEM_OWNER_ERR_CH m This status bit will be set when the ownership of memory block is wrong. (RO)

RMT_MEM_FULL_CH m This status bit will be set if the receiver receives more data than the memory can fit. (RO)

RMT_APB_MEM_RD_ERR_CH m This status bit will be set if the offset address is out of memory size (overflows) when reads RAM via APB bus. (RO)

Register 33.11. RMT_INT_RAW_REG (0x0070)

(reserved)	RMT_CH7_DMA_ACCESS_FAIL_INT_RAW	RMT_CH3_DMA_ACCESS_FAIL_INT_RAW	RMT_CH7_RX_THR_EVENT_INT_RAW	RMT_CH6_RX_THR_EVENT_INT_RAW	RMT_CH5_RX_THR_EVENT_INT_RAW	RMT_CH4_RX_THR_EVENT_INT_RAW	RMT_CH7_ERR_INT_RAW	RMT_CH6_ERR_INT_RAW	RMT_CH5_ERR_INT_RAW	RMT_CH4_ERR_INT_RAW	RMT_CH7_RX_END_INT_RAW	RMT_CH6_RX_END_INT_RAW	RMT_CH5_RX_END_INT_RAW	RMT_CH4_RX_END_INT_RAW	RMT_CH8_TX_LOOP_INT_RAW	RMT_CH2_TX_LOOP_INT_RAW	RMT_CH1_TX_LOOP_INT_RAW	RMT_CH0_TX_THR_EVENT_INT_RAW	RMT_CH3_ERR_INT_RAW	RMT_CH2_ERR_INT_RAW	RMT_CH1_ERR_INT_RAW	RMT_CH0_ERR_INT_RAW	RMT_CH3_TX_END_INT_RAW	RMT_CH2_TX_END_INT_RAW	RMT_CH1_TX_END_INT_RAW	RMT_CH0_TX_END_INT_RAW	Reset

RMT_CH n _TX_LOOP_INT_RAW ($n = 0-3$) The interrupt raw bit of [RMT_CH \$n\$ _TX_LOOP_INT](#). (R/WTC/SS)

RMT_CH m _RX_END_INT_RAW ($m = 4-7$) The interrupt raw bit of [RMT_CH \$m\$ _RX_END_INT](#). (R/WTC/SS)

RMT_CH m _ERR_INT_RAW ($m = 4-7$) The interrupt raw bit of [RMT_CH \$m\$ _ERR_INT](#). (R/WTC/SS)

RMT_CH m _RX_THR_EVENT_INT_RAW ($m = 4-7$) The interrupt raw bit of [RMT_CH \$m\$ _RX_THR_EVENT_INT](#). (R/WTC/SS)

RMT_CH3_DMA_ACCESS_FAIL_INT_RAW The interrupt raw bit of [RMT_CH3_DMA_ACCESS_FAIL_INT](#). (R/WTC/SS)

RMT_CH7_DMA_ACCESS_FAIL_INT_RAW The interrupt raw bit of [RMT_CH7_DMA_ACCESS_FAIL_INT](#). (R/WTC/SS)

Register 33.15. RMT_CH n CARRIER_DUTY_REG (n : 0-3) (0x0080+0x4* n)

31	16	15	0
0x40		0x40	
			Reset

RMT_CARRIER_LOW_CH n This field is used to configure carrier wave's low level clock period for channel n . (R/W)

RMT_CARRIER_HIGH_CH n This field is used to configure carrier wave's high level clock period for channel n . (R/W)

Register 33.16. RMT_CH n TX_LIM_REG (n : 0-3) (0x00A0+0x4* n)

31	22	21	20	19	18	9	8	0
0		0		0		0		0x80
								Reset

RMT_TX_LIM_CH n This field is used to configure the maximum entries that channel n can send out. (R/W)

RMT_TX_LOOP_NUM_CH n This field is used to configure the maximum loop count when continuous TX mode is enabled. (R/W)

RMT_TX_LOOP_CNT_EN_CH n This bit is the enable bit for loop counting. (R/W)

RMT_LOOP_COUNT_RESET_CH n This bit is used to reset the loop count when continuous TX mode is enabled. (WT)

RMT_LOOP_STOP_EN_CH n Set this bit, if the loop counting reaches the value set in RMT_TX_LOOP_CNT_EN_CH n , continuous TX mode will be stopped. (R/W)

34 Pulse Count Controller (PCNT)

The pulse count controller (PCNT) is designed to count input pulses. It can increment or decrement a pulse counter value by keeping track of rising (positive) or falling (negative) edges of the input pulse signal. The PCNT has four independent pulse counters called units, which have their groups of registers. There is only one clock in PCNT, which is APB_CLK. In this chapter, n denotes the number of a unit from 0 ~ 3.

Each unit includes two channels (ch0 and ch1) which can independently increment or decrement its pulse counter value. The remainder of the chapter will mostly focus on channel 0 (ch0) as the functionality of the two channels is identical.

As shown in Figure 34-1, each channel has two input signals:

1. One input pulse signal (e.g. sig_ch0_ un , the input pulse signal for ch0 of unit n ch0)
2. One control signal (e.g. ctrl_ch0_ un , the control signal for ch0 of unit n ch0)

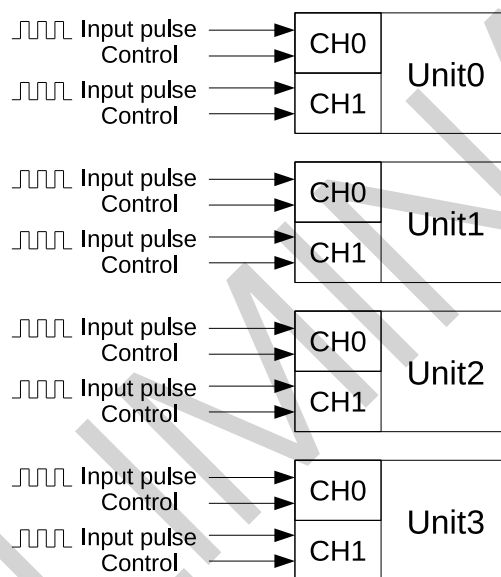

Figure 34-1. PCNT Block Diagram

34.1 Features

A PCNT has the following features:

- Four independent pulse counters (units) that count from 1 to 65535
- Each unit consists of two independent channels sharing one pulse counter
- All channels have input pulse signals (e.g. sig_ch0_ un) with their corresponding control signals (e.g. ctrl_ch0_ un)
- Independently filter glitches of input pulse signals (sig_ch0_ un and sig_ch1_ un) and control signals (ctrl_ch0_ un and ctrl_ch1_ un) on each unit
- Each channel has the following parameters:
 1. Selection between counting on positive or negative edges of the input pulse signal

2. Configuration to Increment, Decrement, or Disable counter mode for control signal's high and low states

- Maximum frequency of pulses: 40 MHz

34.2 Functional Description

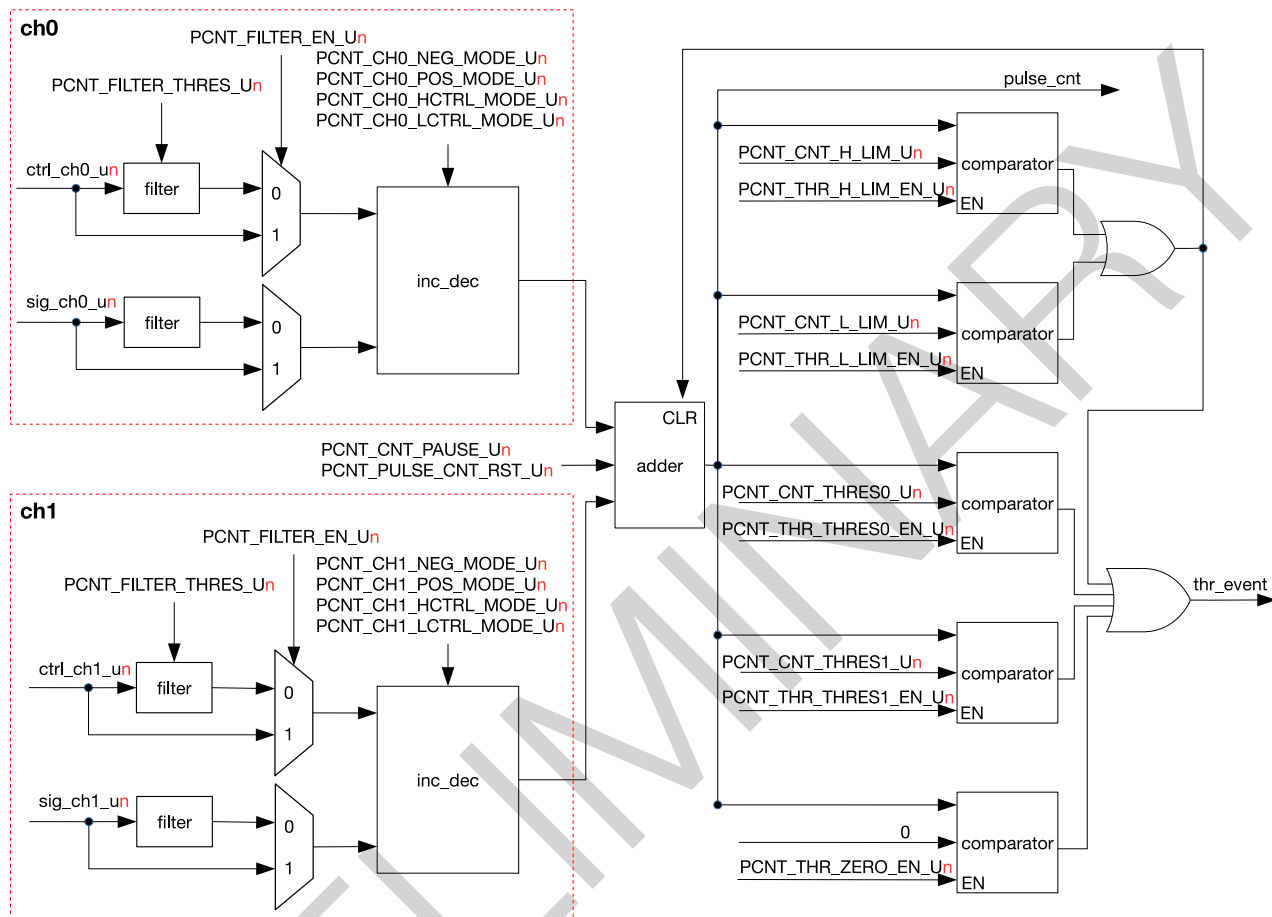

Figure 34-2. PCNT Unit Architecture

Figure 34-2 shows PCNT's architecture. As stated above, `ctrl_ch0_un` is the control signal for ch0 of unit n . Its high and low states can be assigned different counter modes and used for pulse counting of the channel's input pulse signal `sig_ch0_un` on negative or positive edges. The available counter modes are as follows:

- Increment mode: When a channel detects an active edge of `sig_ch0_un` (can be configured by software), the counter value `pulse_cnt` increases by 1. Upon reaching `PCNT_CNT_H_LIM_Un`, `pulse_cnt` is cleared. If the channel's counter mode is changed or if `PCNT_CNT_PAUSE_Un` is set before `pulse_cnt` reaches `PCNT_CNT_H_LIM_Un`, then `pulse_cnt` freezes and its counter mode changes.
- Decrement mode: When a channel detects an active edge of `sig_ch0_un` (can be configured by software), the counter value `pulse_cnt` decreases by 1. Upon reaching `PCNT_CNT_L_LIM_Un`, `pulse_cnt` is cleared. If the channel's counter mode is changed or if `PCNT_CNT_PAUSE_Un` is set before `pulse_cnt` reaches `PCNT_CNT_H_LIM_Un`, then `pulse_cnt` freezes and its counter mode changes.
- Disable mode: Counting is disabled, and the counter value `pulse_cnt` freezes.

Table 34-1 to Table 34-4 provide information on how to configure the counter mode for channel 0.

Table 34-1. Counter Mode. Positive Edge of Input Pulse Signal. Control Signal in Low State

PCNT_CH0_POS_MODE_U n	PCNT_CH0_LCTRL_MODE_U n	Counter Mode
1	0	Increment
	1	Decrement
	Others	Disable
2	0	Decrement
	1	Increment
	Others	Disable
Others	N/A	Disable

Table 34-2. Counter Mode. Positive Edge of Input Pulse Signal. Control Signal in High State

PCNT_CH0_NEG_MODE_U n	PCNT_CH0_LCTRL_MODE_U n	Counter Mode
1	0	Increment
	1	Decrement
	Others	Disable
2	0	Decrement
	1	Increment
	Others	Disable
Others	N/A	Disable

Table 34-4. Counter Mode. Negative Edge of Input Pulse Signal. Control Signal in High State

PCNT_CH0_NEG_MODE_U n	PCNT_CH0_HCTRL_MODE_U n	Counter Mode
1	0	Increment
	1	Decrement
	Others	Disable
2	0	Decrement
	1	Increment
	Others	Disable
Others	N/A	Disable

Each unit has one filter for all its control and input pulse signals. A filter can be enabled with the bit `PCNT_FILTER_EN_Un`. The filter monitors the signals and ignores all the noise, i.e. the glitches with pulse widths shorter than `PCNT_FILTER_THRES_Un` APB clock cycles in length.

As previously mentioned, each unit has two channels which process different input pulse signals and increase or decrease values via their respective inc_dec modules, then the two channels send these values to the adder module which has a 16-bit wide signed register. This adder can be suspended by setting `PCNT_CNT_PAUSE_Un`, and cleared by setting `PCNT_PULSE_CNT_RST_Un`.

The PCNT has five watchpoints that share one interrupt. The interrupt can be enabled or disabled by interrupt enable signals of each individual watchpoint.

- Maximum count value: When pulse_cnt reaches `PCNT_CNT_H_LIM_Un`, a high limit interrupt is triggered and `PCNT_CNT_THR_H_LIM_LAT_Un` is high.
- Minimum count value: When pulse_cnt reaches `PCNT_CNT_L_LIM_Un`, a low limit interrupt is triggered and `PCNT_CNT_THR_L_LIM_LAT_Un` is high.
- Two threshold values: When pulse_cnt equals either `PCNT_CNT_THRES0_Un` or `PCNT_CNT_THRES1_Un`, an interrupt is triggered and either `PCNT_CNT_THR_THRES0_LAT_Un` or `PCNT_CNT_THR_THRES1_LAT_Un` is high respectively.
- Zero: When pulse_cnt is 0, an interrupt is triggered and `PCNT_CNT_THR_ZERO_LAT_Un` is valid.

34.3 Applications

In each unit, channel 0 and channel 1 can be configured to work independently or together. The three subsections below provide details of channel 0 incrementing independently, channel 0 decrementing independently, and channel 0 and channel 1 incrementing together. For other working modes not elaborated in this section (e.g. channel 1 incrementing/decrementing independently, or one channel incrementing while the other decrementing), reference can be made to these three subsections.

34.3.1 Channel 0 Incrementing Independently

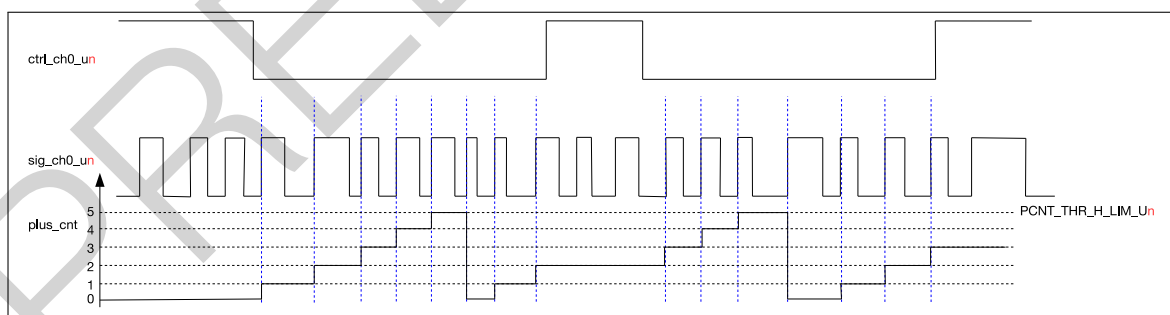

Figure 34-3. Channel 0 Up Counting Diagram

Figure 34-3 illustrates how channel 0 is configured to increment independently on the positive edge of `sig_ch0_un` while channel 1 is disabled (see subsection 34.2 for how to disable channel 1). The configuration of channel 0 is shown below.

- `PCNT_CH0_LCTRL_MODE_Un=0`: When `ctrl_ch0_un` is low, the counter mode specified for the low state turns on, in this case it is Increment mode.

- `PCNT_CH0_HCTRL_MODE_Un=2`: When `ctrl_ch0_un` is high, the counter mode specified for the low state turns on, in this case it is Disable mode.
- `PCNT_CH0_POS_MODE_Un=1`: The counter increments on the positive edge of `sig_ch0_un`.
- `PCNT_CH0_NEG_MODE_Un=0`: The counter idles on the negative edge of `sig_ch0_un`.
- `PCNT_CNT_H_LIM_Un=5`: When `pulse_cnt` counts up to `PCNT_CNT_H_LIM_Un`, it is cleared.

34.3.2 Channel 0 Decrementing Independently

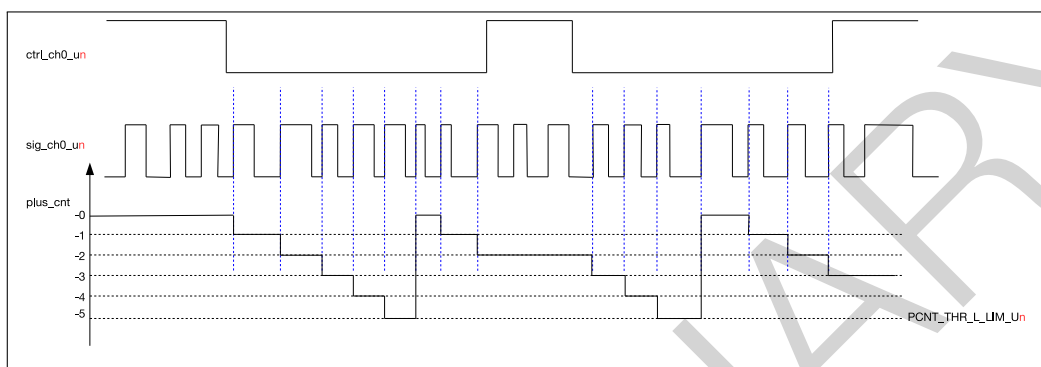

Figure 34-4. Channel 0 Down Counting Diagram

Figure 34-4 illustrates how channel 0 is configured to decrement independently on the positive edge of `sig_ch0_un` while channel 1 is disabled. The configuration of channel 0 in this case differs from that in Figure 34-3 in the following aspects:

- `PCNT_CH0_POS_MODE_Un=2`: the counter decrements on the positive edge of `sig_ch0_un`.
- `PCNT_CNT_L_LIM_Un=-5`: when `pulse_cnt` counts down to `PCNT_CNT_L_LIM_Un`, it is cleared.

34.3.3 Channel 0 and Channel 1 Incrementing Together

Figure 34-5. Two Channels Up Counting Diagram

Figure 34-5 illustrates how channel 0 and channel 1 are configured to increment on the positive edge of `sig_ch0_un` and `sig_ch1_un` respectively at the same time. It can be seen in Figure 34-5 that control signal `ctrl_ch0_un` and `ctrl_ch1_un` have the same waveform, so as input pulse signal `sig_ch0_un` and `sig_ch1_un`. The configuration procedure is shown below.

- For channel 0:

- `PCNT_CH0_LCTRL_MODE_Un=0`: When `ctrl_ch0_un` is low, the counter mode specified for the low state turns on, in this case it is Increment mode.
- `PCNT_CH0_HCTRL_MODE_Un=2`: When `ctrl_ch0_un` is high, the counter mode specified for the low state turns on, in this case it is Disable mode.
- `PCNT_CH0_POS_MODE_Un=1`: The counter increments on the positive edge of `sig_ch0_un`.
- `PCNT_CH0_NEG_MODE_Un=0`: The counter idles on the negative edge of `sig_ch0_un`.
- For channel 1:
 - `PCNT_CH1_LCTRL_MODE_Un=0`: When `ctrl_ch1_un` is low, the counter mode specified for the low state turns on, in this case it is Increment mode.
 - `PCNT_CH1_HCTRL_MODE_Un=2`: When `ctrl_ch1_un` is high, the counter mode specified for the low state turns on, in this case it is Disable mode.
 - `PCNT_CH1_POS_MODE_Un=1`: The counter increments on the positive edge of `sig_ch1_un`.
 - `PCNT_CH1_NEG_MODE_Un=0`: The counter idles on the negative edge of `sig_ch1_un`.
- `PCNT_CNT_H_LIM_Un=10`: When `pulse_cnt` counts up to `PCNT_CNT_H_LIM_Un`, it is cleared.

34.4 Register Summary

The addresses in this section are relative to **Pulse Count Controller** base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Name	Description	Address	Access
Configuration Register			
PCNT_U0_CONF0_REG	Configuration register 0 for unit 0	0x0000	R/W
PCNT_U0_CONF1_REG	Configuration register 1 for unit 0	0x0004	R/W
PCNT_U0_CONF2_REG	Configuration register 2 for unit 0	0x0008	R/W
PCNT_U1_CONF0_REG	Configuration register 0 for unit 1	0x000C	R/W
PCNT_U1_CONF1_REG	Configuration register 1 for unit 1	0x0010	R/W
PCNT_U1_CONF2_REG	Configuration register 2 for unit 1	0x0014	R/W
PCNT_U2_CONF0_REG	Configuration register 0 for unit 2	0x0018	R/W
PCNT_U2_CONF1_REG	Configuration register 1 for unit 2	0x001C	R/W
PCNT_U2_CONF2_REG	Configuration register 2 for unit 2	0x0020	R/W
PCNT_U3_CONF0_REG	Configuration register 0 for unit 3	0x0024	R/W
PCNT_U3_CONF1_REG	Configuration register 1 for unit 3	0x0028	R/W
PCNT_U3_CONF2_REG	Configuration register 2 for unit 3	0x002C	R/W
PCNT_CTRL_REG	Control register for all counters	0x0060	R/W
Status Register			
PCNT_U0_CNT_REG	Counter value for unit 0	0x0030	RO
PCNT_U1_CNT_REG	Counter value for unit 1	0x0034	RO
PCNT_U2_CNT_REG	Counter value for unit 2	0x0038	RO
PCNT_U3_CNT_REG	Counter value for unit 3	0x003C	RO
PCNT_U0_STATUS_REG	PNCT UNIT0 status register	0x0050	RO
PCNT_U1_STATUS_REG	PNCT UNIT1 status register	0x0054	RO
PCNT_U2_STATUS_REG	PNCT UNIT2 status register	0x0058	RO
PCNT_U3_STATUS_REG	PNCT UNIT3 status register	0x005C	RO
Interrupt Register			
PCNT_INT_RAW_REG	Interrupt raw status register	0x0040	RO
PCNT_INT_ST_REG	Interrupt status register	0x0044	RO
PCNT_INT_ENA_REG	Interrupt enable register	0x0048	R/W
PCNT_INT_CLR_REG	Interrupt clear register	0x004C	WO
Version Register			
PCNT_DATE_REG	PCNT version control register	0x00FC	R/W

34.5 Registers

The addresses in this section are relative to **Pulse Count Controller** base address provided in Table 3-3 in Chapter 3 *System and Memory*.

Register 34.1. PCNT_U_n_CONF0_REG (n: 0-3) (0x0000+0xC*n)

PCNT_CH1_LCTRL_MODE_U0		PCNT_CH1_HCTRL_MODE_U0		PCNT_CH1_POS_MODE_U0		PCNT_CH1_NEG_MODE_U0		PCNT_CH0_LCTRL_MODE_U0		PCNT_CH0_HCTRL_MODE_U0		PCNT_CH0_POS_MODE_U0		PCNT_CH0_NEG_MODE_U0		PCNT_THR_THRES1_EN_U0		PCNT_THR_THRES0_EN_U0		PCNT_THR_L_LIM_EN_U0		PCNT_THR_H_LIM_EN_U0		PCNT_THR_ZERO_EN_U0		PCNT_FILTER_THRES_U0			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9					0		
0x0		0x0		0x0		0x0		0x0		0x0		0x0		0x0		0		1		1		1		1		0x10			

Reset

PCNT_FILTER_THRES_U_n This sets the maximum threshold, in APB_CLK cycles, for the filter.

Any pulses with width less than this will be ignored when the filter is enabled. (R/W)

PCNT_FILTER_EN_U_n This is the enable bit for unit *n*'s input filter. (R/W)

PCNT_THR_ZERO_EN_U_n This is the enable bit for unit *n*'s zero comparator. (R/W)

PCNT_THR_H_LIM_EN_U_n This is the enable bit for unit *n*'s thr_h_lim comparator. (R/W)

PCNT_THR_L_LIM_EN_U_n This is the enable bit for unit *n*'s thr_l_lim comparator. (R/W)

PCNT_THR_THRES0_EN_U_n This is the enable bit for unit *n*'s thres0 comparator. (R/W)

PCNT_THR_THRES1_EN_U_n This is the enable bit for unit *n*'s thres1 comparator. (R/W)

PCNT_CH0_NEG_MODE_U_n This register sets the behavior when the signal input of channel 0 detects a negative edge.

1: Increase the counter; 2: Decrease the counter; 0, 3: No effect on counter (R/W)

PCNT_CH0_POS_MODE_U_n This register sets the behavior when the signal input of channel 0 detects a positive edge.

1: Increase the counter; 2: Decrease the counter; 0, 3: No effect on counter (R/W)

PCNT_CH0_HCTRL_MODE_U_n This register configures how the CH_{*n*}_POS_MODE/CH_{*n*}_NEG_MODE settings will be modified when the control signal is high.

0: No modification; 1: Invert behavior (increase -> decrease, decrease -> increase); 2, 3: Inhibit counter modification (R/W)

Continued on the next page...

Register 34.1. PCNT_UN_CONF0_REG (n: 0-3) (0x0000+0xC*n)

Continued from the previous page...

PCNT_CH0_LCTRL_MODE_UN This register configures how the CH_n_POS_MODE/CH_n_NEG_MODE settings will be modified when the control signal is low.

0: No modification; 1: Invert behavior (increase -> decrease, decrease -> increase); 2, 3: Inhibit counter modification (R/W)

PCNT_CH1_NEG_MODE_UN This register sets the behavior when the signal input of channel 1 detects a negative edge.

1: Increment the counter; 2: Decrement the counter; 0, 3: No effect on counter (R/W)

PCNT_CH1_POS_MODE_UN This register sets the behavior when the signal input of channel 1 detects a positive edge.

1: Increment the counter; 2: Decrement the counter; 0, 3: No effect on counter (R/W)

PCNT_CH1_HCTRL_MODE_UN This register configures how the CH_n_POS_MODE/CH_n_NEG_MODE settings will be modified when the control signal is high.

0: No modification; 1: Invert behavior (increase -> decrease, decrease -> increase); 2, 3: Inhibit counter modification (R/W)

PCNT_CH1_LCTRL_MODE_UN This register configures how the CH_n_POS_MODE/CH_n_NEG_MODE settings will be modified when the control signal is low.

0: No modification; 1: Invert behavior (increase -> decrease, decrease -> increase); 2, 3: Inhibit counter modification (R/W)

Register 34.2. PCNT_UN_CONF1_REG (n: 0-3) (0x0004+0xC*n)

31	16	15	0
0x00		0x00	
			Reset

PCNT_CNT_THRES0_UN This register is used to configure the thres0 value for unit *n*. (R/W)

PCNT_CNT_THRES1_UN This register is used to configure the thres1 value for unit *n*. (R/W)

Register 34.6. PCNT_U n _STATUS_REG (n : 0-3) (0x0050+0x4*n)

(reserved)														PCNT_CNT_THR_ZERO_LAT_U0 PCNT_CNT_THR_H_LIM_LAT_U0 PCNT_CNT_THR_L_LIM_LAT_U0 PCNT_CNT_THR_THRES0_LAT_U0 PCNT_CNT_THR_THRES1_LAT_U0 PCNT_CNT_THR_ZERO_MODE_U0									
31															7	6	5	4	3	2	1	0	
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0x0	Reset

PCNT_CNT_THR_ZERO_MODE_U n The pulse counter status of PCNT_U n corresponding to 0. 0: pulse counter decreases from positive to 0. 1: pulse counter increases from negative to 0. 2: pulse counter is negative. 3: pulse counter is positive. (RO)

PCNT_CNT_THR_THRES1_LAT_U n The latched value of thres1 event of PCNT_U n when threshold event interrupt is valid. 1: the current pulse counter equals to thres1 and thres1 event is valid. 0: others (RO)

PCNT_CNT_THR_THRES0_LAT_U n The latched value of thres0 event of PCNT_U n when threshold event interrupt is valid. 1: the current pulse counter equals to thres0 and thres0 event is valid. 0: others (RO)

PCNT_CNT_THR_L_LIM_LAT_U n The latched value of low limit event of PCNT_U n when threshold event interrupt is valid. 1: the current pulse counter equals to thr_l_lim and low limit event is valid. 0: others (RO)

PCNT_CNT_THR_H_LIM_LAT_U n The latched value of high limit event of PCNT_U n when threshold event interrupt is valid. 1: the current pulse counter equals to thr_h_lim and high limit event is valid. 0: others (RO)

PCNT_CNT_THR_ZERO_LAT_U n The latched value of zero threshold event of PCNT_U n when threshold event interrupt is valid. 1: the current pulse counter equals to 0 and zero threshold event is valid. 0: others (RO)

Register 34.7. PCNT_INT_RAW_REG (0x0040)

PCNT_CNT_THR_EVENT_U_n_INT_RAW The raw interrupt status bit for the PCNT_CNT_THR_EVENT_U_n_INT interrupt. (RO)

Register 34.8. PCNT_INT_ST_REG (0x0044)

PCNT_CNT_THR_EVENT_U_n_INT_ST The masked interrupt status bit for the PCNT_CNT_THR_EVENT_U_n_INT interrupt. (RO)

Register 34.9. PCNT_INT_ENA_REG (0x0048)

PCNT_CNT_THR_EVENT_U_n_INT_ENA The interrupt enable bit for the PCNT_CNT_THR_EVENT_U_n_INT interrupt. (R/W)

Register 34.10. PCNT_INT_CLR_REG (0x004C)

PCNT_CNT_THR_EVENT_U_nINT_CLR Set this bit to clear the PCNT_CNT_THR_EVENT_U_nINT interrupt. (WO)

Register 34.11. PCNT_DATE_REG (0x00FC)

PCNT_DATE This is the PCNT version control register. (R/W)

Glossary

Abbreviations for Peripherals

AES	AES (Advanced Encryption Standard) Accelerator
BOOTCTRL	Chip Boot Control
DS	Digital Signature
DMA	DMA (Direct Memory Access) Controller
eFuse	eFuse Controller
HMAC	HMAC (Hash-based Message Authentication Code) Accelerator
I2C	I2C (Inter-Integrated Circuit) Controller
I2S	I2S (Inter-IC Sound) Controller
LEDC	LED Control PWM (Pulse Width Modulation)
MCPWM	Motor Control PWM (Pulse Width Modulation)
PCNT	Pulse Count Controller
RMT	Remote Control Peripheral
RNG	Random Number Generator
RSA	RSA (Rivest Shamir Adleman) Accelerator
SDHOST	SD/MMC Host Controller
SHA	SHA (Secure Hash Algorithm) Accelerator
SPI	SPI (Serial Peripheral Interface) Controller
SYSTIMER	System Timer
TIMG	Timer Group
TWAI	Two-wire Automotive Interface
UART	UART (Universal Asynchronous Receiver-Transmitter) Controller
ULP Coprocessor	Ultra-low-power Coprocessor
USB OTG	USB On-The-Go
WDT	Watchdog Timers

Abbreviations for Registers

ISO	Isolation. When a module is power down, its output pins will be stuck in unknown state (some middle voltage). "ISO" registers will control to isolate its output pins to be a determined value, so it will not affect the status of other working modules which are not power down.
NMI	Non-maskable interrupt.
REG	Register.
R/W	Read/write. Software can read and write to these bits.
RO	Read-only. Software can only read these bits.
SYSREG	System Registers
WO	Write-only. Software can only write to these bits.
