## 1. OVERVIEW

5.79 inch e-Paper (G) is a reflective electrophoretic technology display module on an active matrix TFT substrate. The panel is capable of displaying black, white, yellow and red images depending on the associated lookup table used. The circuitry on the panel includes an integrated gate and source driver, timing controller, oscillator, DC-DC boost circuit, and memory to store the frame buffer and lookup tables, and additional circuitry to control VCOM and BORDER settings.

## 2. FEATURES

- ♦ Highlight Red and Yellow color
- ♦ High contrast
- ♦ High reflectance
- ♦ Ultra wide viewing angle
- ♦ Ultra low power consumption
- ♦ Pure reflective mode
- ♦ Bi-stable display
- ♦ Antiglare hard-coated front-surface
- ♦ Low current deep sleep mode
- ♦ On chip display RAM
- ♦ Waveform stored in On-chip OTP
- ♦ Serial peripheral interface available
- ♦ On-chip oscillator
- ♦ On-chip booster and regulator control for generating VCOM, Gate and Source driving voltage
- ♦ I2C signal master interface to read external temperature sensor
- ♦ Available in COG package

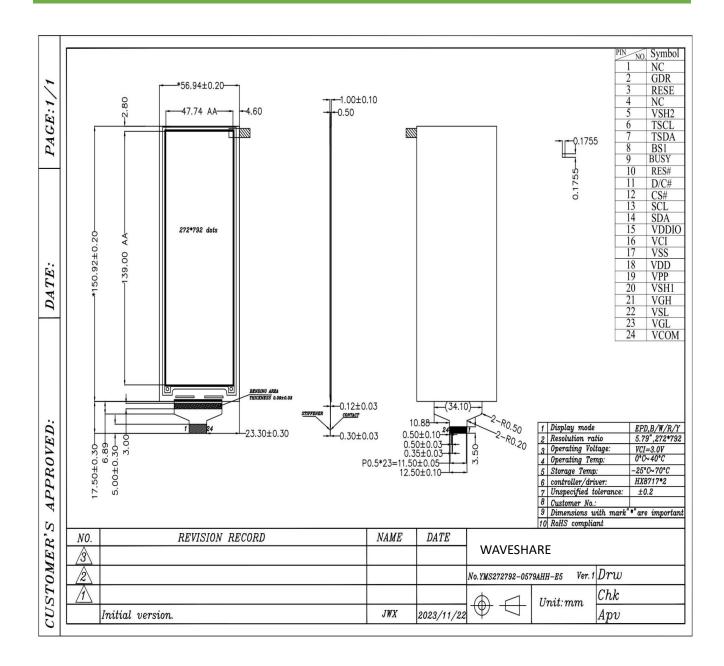

## 3. MECHANICAL SPECIFICATION

| Parameter           | Specification                  | Unit  | Remark  |
|---------------------|--------------------------------|-------|---------|
| Screen Size         | 5.79                           | Inch  |         |
| Display Resolution  | 272(H) x 792(V)                | Pixel | DPI:144 |
| Active Area         | 47.74 x 139.00                 |       |         |
| Pixel Pitch         | 0.1755 x 0.1755                | mm    |         |
| Pixel Configuration | Rectangle                      |       |         |
| Outline Dimension   | 56.94 (H) × 150.92(V) × 1.0(D) | mm    |         |
| Weight              | 15.7±0.5                       | g     |         |
|                     | Shore owesome                  |       |         |

## 4. MECHANICAL DRAWING OF EPD MODULE

# 5. INPUT/OUTPUT PIN ASSIGNMENT

| NO. | Name  | I/O | Description  | Remark    |
|-----|-------|-----|--|-----------|
| 1   | NC    |     | Do not connect with other NPC pins                           | Keep Open |
| 2   | GDR   | 0   | N-Channel MOSFET Gate Drive Control                          |           |
| 3   | RESE  |     | Current Sense Input for the Control Loop                     |           |
| 4   | NC    | NC  | Do not connect with other NC pins                            | Keep Open |

| 10  | VDD   |     | VCI. A capacitor should be connected between VDD and VSS.    |           |
| 19  | VPP   | Р   | FOR TEST   |           |
| 20  | VSH1  | С   | Positive Source driving voltage                              |           |
| 21  | VGH   | С   | Power Supply pin for Positive Gate driving voltage and VSH1  |           |
| 22  | VSL   | С   | Negative Source driving voltage                              |           |
| 23  | VGL   | С   | Power Supply pin for Negative Gate driving voltage VCOM      |           |
| 23  | VGL   |     | and VSL  |           |
| 24  | VCOM  | С   | VCOM driving voltage   |           |

I = Input Pin, O =Output Pin, I/O = Bi-directional Pin (Input/output), P = Power Pin, C =Capacitor Pin

Note 5-1: This pin (CS#) is the chip select input connecting to the MCU. The chip is enabled for MCU

communication only when CS# is pulled LOW.

- Note 5-2: This pin is (D/C#) Data/Command control pin connecting to the MCU in 4-wire SPI mode.

  When the pin is pulled HIGH, the data at SDA will be interpreted as data. When the pin is pulled LOW, the data at SDA will be interpreted as command.
- Note 5-3: This pin (RES#) is reset signal input. The Reset is active low.
- Note 5-4: This pin is Busy state output pin. When Busy is High, the operation of chip should not be interrupted, command should not be sent. The chip would put Busy pin High when -Outputting display waveform-Communicating with digital temperature sensor.

Note 5-5: Bus interface selection pin.

| BS1 State | MCU Interface  |
|-----------|--|
| L         | 4-lines serial peripheral interface(SPI) - 8 bits SPI  |
| Н         | 3- lines serial peripheral interface(SPI) - 9 bits SPI |

## 6. ELECTRICAL CHARACTERISTICS

## **6.1 ABSOLUTE MAXIMUM RATING**

| Parameter                | Symbol | Rating           | Unit |
|--------------------------|--------|------------------|------|
| Logic supply voltage     | VCI    | -0.3 to +5.0     | V    |
| Logic Input voltage      | VIN    | -0.3 to VCI +0.3 | V    |
| Logic Output voltage     | VOUT   | -0.5 to VCI +0.5 | V    |
| Operating Temp range     | TOPR   | 0 to +40         | °C   |
| Storage Temp range       | TSTG   | -25 to+70        | °C   |
| Optimal Storage Temp     | TSTGo  | 23±2             | °C   |
| Optimal Storage Humidity | HSTGo  | 55±10            | %RH  |

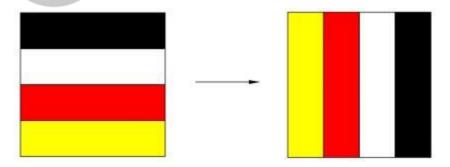

Note: If ICs are stressed beyond those listed above "absolute maximum ratings", they may be permanently destroyed. These are stress ratings only, and functional operation of the device at these or any other condition beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.

## **6.2 DC CHARACTERISTICS**

| Parameter                 | Symbol                | Condition             | Applicable pin | Min.   | Тур.  | Max.   | Unit |
|---------------------------|-----------------------|-----------------------|----------------|--------|-------|--------|------|
| Single ground             | Vss                   | -                     |                | -      | 0     | -      | V    |
| IO supply voltage         | Vcı                   | -                     | VCI            | 2.3    | 3.3   | 3.6    | ٧    |
| Supply voltage            | $V_{DD}$              |                       | VDD            | 2.3    | 3.3   | 3.6    | V    |
| High level input voltage  | V <sub>IH</sub>       | -                     | -              | 0.8VCI | -     | VCI    | V    |
| Low level input voltage   | V <sub>IL</sub>       | -                     | -              | 0      | 1     | 0.2VCI | V    |
| High level output voltage | V <sub>он</sub>       | IOH = 400uA           | -              | 0.8VCI | -     | VCI    | >    |
| Low level output voltage  | V <sub>OL</sub>       | IOL = -400uA          | -              | 0      | -     | 0.2VCI | >    |
| Typical power             | $P_{TYP}$             | V <sub>CI</sub> =3.0V | -              | -      | 41.4  | -      | mW   |
| Deep sleep mode           | P <sub>STPY</sub>     | V <sub>CI</sub> =3.0V | -              | -      | 0.003 | -      | mW   |

| Image update time         | -                     | 25 °C                 | -              | -      | 26    | -      | sec  |
| Sleep mode<br>current     | IsIp_V <sub>CI</sub>  |                       | -              | -      | 30    | 40     | uA   |
| Deep sleep mode current   | ldslp_V <sub>Cl</sub> |                       | -              | -      | 1     | 5      | uA   |

Notes: 1. The typical power is measured with following transition from horizontal 4 scale pattern to vertical 4 scale pattern.

- 2. The deep sleep power is the consumed power when the panel controller is in deep sleep mode.
- 3. The listed electrical/optical characteristics are only guaranteed under the controller & waveform provided by Waveshare.
  - 3. Electrical measurement: Multimeter

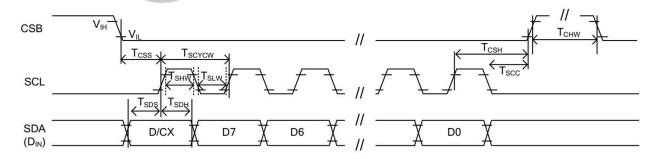

## 6.3 AC CHARACTERISTICS

## 6.3.1 DISPLAY AC CHARACTERISTICS

Note: (1) All other register addresses are invalid or reserved by Himax and should not be used.

<sup>(2)</sup> Commands are processed on the 'stop' condition of the interface.

<sup>(3)</sup> Registers marked "W/R" can be read, but the contents are written when the SPI command completes – so the contents can be read and altered. The user can subsequently write the register to restore the contents following an SPI read

<sup>(4)</sup> Any bits shown here as 0 must be written with a 0. All unused bits should also be set to zero. Device malfunction may occur if this is not done.

The command define as follows:

## 1st parameter:

| BT_PHA[7:6] | Bit[7:6]:Soft start period of phase A | Note    |
|-------------|---------------------------------------|---------|
| 00          | 10ms                                  | Default |
| 01          | 20ms                                  |         |
| 10          | 30ms                                  | -       |
| 11          | 40ms                                  | -       |

| BT_PHA[5:3] | Bit[5:3]:Driving strength of phase A | Note      |  |
|-------------|--------------------------------------|-----------|--|
| 000         | Strength 1                           |           |  |
| 001         | Strength 2                           |           |  |
| 010         | Strength 3                           | Default   |  |
| 011         | Strength 4                           | -         |  |
| 100         | Strength 5                           | -         |  |
| 101         | Strength 6                           | -         |  |
| 110         | Strength 7                           |           |  |
| 111         | Strength 8                           | Strongest |  |

| BT_PHA[2:0] | Bit[2:0]:Min. off time setting of GDR in phase A | Note    |
|-------------|--|---------|
| 000         | 0.27µs   |         |
| 001         | 0.34µs   | -       |
| 010         | 0.40µs   | -       |
| 011         | 0.54µs   | -       |
| 100         | 0.80µs   |         |
| 101         | 1.54µs   | 2.9     |
| 110         | 3.34µs   |         |
| 111         | 6.58µs   | Default |

## Description

## 2<sup>nd</sup> parameter:

| BT_PHB[7:6] | Bit[7:6]:Soft start period of phase B | Note    |
|-------------|---------------------------------------|---------|
| 00          | 10ms                                  | Default |
| 01          | 20ms                                  | -       |
| 10          | 30ms                                  |         |
| 11          | 40ms                                  | -       |

| BT_PHB[5:3] | Bit[5:3]:Driving strength of phase B | Note      |  |  |
|-------------|--------------------------------------|-----------|--|--|
| 000         | Strength 1                           |           |  |  |
| 001         | Strength 2                           |           |  |  |
| 010         | Strength 3                           | Default   |  |  |
| 011         | Strength 4                           |           |  |  |
| 100         | Strength 5                           |           |  |  |
| 101         | Strength 6                           | 1.0       |  |  |
| 110         | Strength 7                           | -         |  |  |
| 111         | Strength 8                           | Strongest |  |  |
|             |                                      |           |  |  |

| BT_PHB[2:0] | Bit[2:0]:Min. off time setting of GDR in phase B | Note    |
|-------------|--|---------|
| 000         | 0.27µs   | -       |
| 001         | 0.34µs   | 7.2     |
| 010         | 0.40µs   |         |
| 011         | 0.54µs   |         |
| 100         | 0.80µs   |         |
| 101         | 1.54µs   | 1.2     |
| 110         | 3.34µs   |         |
| 111         | 6.58µs   | Default |

| BT_PHC[5:3] | Bit[5:3]:Driving strength of phase C | Note      |
|-------------|--------------------------------------|-----------|
| 000         | Strength 1                           | -         |
| 001         | Strength 2                           |           |
| 010         | Strength 3                           | Default   |
| 011         | Strength 4                           |           |
| 100         | Strength 5                           |           |
| 101         | Strength 6                           |           |
| 110         | Strength 7                           |           |
| 111         | Strength 8                           | Strongest |

| BT_PHC[2:0] | Bit[2:0]:Min. off time setting of GDR in phase C | Note    |

The command define as follows:

This command indicates that user starts to transmit data. Then write to SRAM. While complete data transmission, user must send a Data Refresh command. Then the chip will start to send data/VCOM for panel.

Pixel[1~n][1:0] (2-bit mode):

| Des | crip | tion |
|-----|------|------|

|            | Source output look up table |                         |                   |                      |  |  |  |  |  |  |
|------------|-----------------------------|-------------------------|-------------------|----------------------|--|--|--|--|--|--|
| Image Data | DDX=1 (De                   | fault)                  | DDX=0             |                      |  |  |  |  |  |  |
| Pixel[1:0] | Gray level select           | IP output<br>LUT select | Gray level select | IP output LUT select |  |  |  |  |  |  |
| 00         | Gray 0                      | ogray00                 | Gray 3            | ogray03              |  |  |  |  |  |  |
| 01         | Gray 1                      | ogray01                 | Gray 2            | ogray02              |  |  |  |  |  |  |
| 10         | Gray 2                      | ogray02                 | Gray 1            | ogray01              |  |  |  |  |  |  |
| 11         | Gray 3                      | ogray03                 | Gray 0            | ogray00              |  |  |  |  |  |  |

Data mapping example:
When DDX=1, Pixel[1:0]=01->Gray level select= Gray 1, follow LUT data output from IP output port\*ogray01\*
When DDX=0, Pixel[1:0]=11->Gray level select= Gray 0, follow LUT data output from IP output port\*ogray00\*

Description

| Action        | W/R | C/D | D7  | D6 | D5 | D4 | D3 | D2 | D1   | D0 | HEX |
|---------------|-----|-----|-----|----|----|----|----|----|------|----|-----|
| TSE           | W   | С   | 0   | 1  | 0  | 0  | 0  | 0  | 0    | 1  | 41h |
| 1st parameter | W   | D   | TSE | -  | -  |    |    | TO | 3:01 | 70 | 00h |

The command define as follows:

This command indicates the driver IC temperature sensor enable and calibration function.

#### 1<sup>st</sup> parameter:

| TSE | Bit[7]:TSE                           | Note    |
|-----|--------------------------------------|---------|
| 0   | Enable internal temperature sensor   | Default |
| 1   | Disable internal temperature sensor. | -       |

#### Description

TO[3:0]: Reserve one temperature offset TO[3:0] for calibration

(Internal temperature sensor)

1. TO[3]: Mean '+' or '-', while 0 is '+'; 1 is '-'.

2. TO[2:0]: Mean temperature offset value.

| TO[3:0] | Bit[3:0]:Temperature level | TO[3:0] | Bit[3:0]:Temperature level |
|---------|----------------------------|---------|----------------------------|
| 0000    | + 0°C (Default)            | 1000    | - 8°C                      |
| 0001    | + 1°C                      | 1001    | - 7°C                      |
|         | :                          | 1       |                            |
| 0111    | + 7°C                      | 1111    | - 1°C                      |

| Action                    | W/R | C/D | D7    | D6       | D5   | D4  | D3 | D2  | D1    | D0    | HEX |
|---------------------------|-----|-----|-------|----------|------|-----|----|-----|-------|-------|-----|
| CDI                       | W   | C   | 0     | 1        | 0    | 1   | 0  | 0   | 0     | 0     | 50h |
| 1 <sup>st</sup> parameter | W   | D   | - 0.0 | VBD[2:0] | 1.00 | DDX |    | CDI | [3:0] | 10021 | 97h |

The command define as follows:

This command can set 2 kinds of parameters:

1. VCOM to data output interval (CDI) 2. Border pin output.

### VBD[2:0]/DDX: Border data selection. (From LUT)

This register will make border pin output being mapped to a certain gray scale.

| DDX | VBD[2:0] | Gray level | Note    |
|-----|----------|------------|---------|
|     | 000      | Floating   |         |
|     | 001      | Gray 3     |         |
| 0   | 010      | Gray 2     | 3 52    |
|     | 011      | Gray 1     |         |
|     | 100      | Gray 0     | 154     |
|     | 000      | Gray 0     |         |
|     | 001      | Gray 1     |         |
| 1   | 010      | Gray 2     | 5 42    |
|     | 011      | Gray 3     |         |
|     | 100      | Floating   | Default |

Border output voltage level: The level selection is based on mapping LUT data with VCOM shift

added.

E.g.: Gray 1 waveform is mapping to 15V, VCOM value being set as -2V, the real output on border pin shall be 15V+(-2V)=13V.

Border output will follow FOPT definition being defined in R00h.

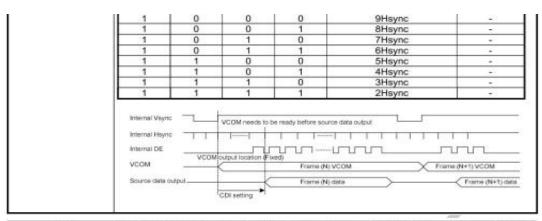

#### CDI[3:0]:

This command indicates the interval of VCOM and data output. When setting the vertical back porch, the total blanking will be kept as a default value (Count by Hsync).

#### Description

| Bit[3] | Bit[2] | Bit[1] | Bit[0] | VCOM and data interval | Note    |
|--------|--------|--------|--------|------------------------|---------|
| 0      | 0      | 0      | 0      | 17Hsync                |         |
| 0      | 0      | 0      | 1      | 16Hsync                |         |

## 8. OPTICAL SPECIFICATIONS

Measurements are made with that the illumination is under an angle of 45 degree, the detection is perpendicular unless otherwise specified.

| Symbol   | Parameter          | Conditions | Min | Тур.                     | Max      | Units | Notes |

Note 8-1: Luminance meter: Eye-One Pro Spectrophotometer.

Note 8-2: CR=Surface Reflectance with all white pixel/Surface Reflectance with all black pixels.

## 9. HANDLING, SAFETY, AND ENVIRONMENT REQUIREMENTS

#### WARNING

The display glass may break when it is dropped or bumped on a hard surface. Handle with care. Should the display break, do not touch the electrophoretic material. In case of contact with electrophoretic material, wash with water and soap.

#### **CAUTION**

The display module should not be exposed to harmful gases, such as acid and alkali gases, which corrode electronic components. Disassembling the display module.

Disassembling the display module can cause permanent damage and invalidates the warranty agreements.

Observe general precautions that are common to handling delicate electronic components. The glass can break and front surfaces can easily be damaged. Moreover the display is sensitive to static electricity and other rough environmental conditions.

| 7  | Temperature Cycle                         | 1 cycle: [-25°C 30min]→ [+60 °C 30 min] : 50 cycles Test in white pattern   |
| 8  | UV exposure Resistance                    | 765W/m² for 168hrs, 40 °C Test in white pattern                             |
| 9  | ESD Gun                                   | Air+/-4KV; Contact +/-2KV<br>(Naked EPD display, including IC and FPC area) |

Note: Put in normal temperature for 1hour after test finished, display performance is ok.

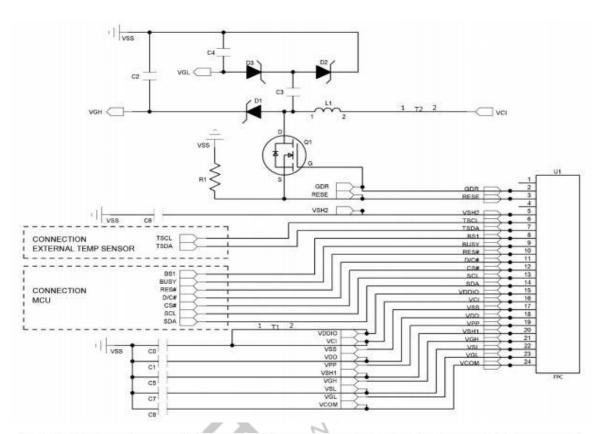

## 11. REFERENCE CIRCUIT

## 12. TYPICAL APPLICATION CIRCUIT

| Part Name | Value            | Requirements/Reference Part  |
|-----------|------------------|--|
| C0-C1     | 1uF              | X5R/X7R; Voltage Rating : 6V or 25V  |
| C2-C7     | 1uF              | 0603/0805; X5R/X7R; Voltage Rating : 25V   |
| C8        | 1uF              | 0603/0805; X7R; Voltage Rating : 25V   |
| R1        | 2.2 ohm          | 0603/0805; 1% variation, ≥ 0.05W   |
| D1-D3     | Diode            | MBR0530 1) Reverse DC voltage ≥ 30V 2) Io ≥ 500mA 3) Forward voltage ≤ 430mV   |
| Q1        | NMOS             | Si1304BDL/NX3008NBK  1) Drain-Source breakdown voltage ≥ 30V 2) Vgs(th) = 0.9V (Typ), 1.3V (Max) 3) Rds on ≤ 2.1Ω @ Vgs = 2.5V |
| L1        | 47uH             | CDRH2D18 / LDNP-470NC<br>lo= 500mA (Max)   |
| U1        | 0.5mm ZIF socket | 24pins, 0.5mm pitch  |

## Remarks:

- 1) The recommended component value and reference part in Table is subject to change depending on panel loading.
- 2) Customer is required to review if the selected component value and part is suitable for their application.

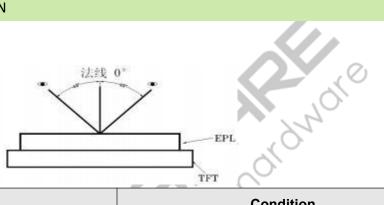

## 13. INITIALIZATION PROCEDURE

**TBD** 

## 14. INSPECTION METHOD AND CONDITION

## 14.1 INSPECTION CONDITION

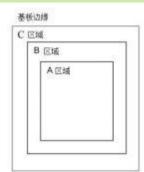

| Item              | Condition                |
